Thomas J. Baird* (tbaird@mun.ca). *GKM-Sheaves and Equivariant Cohomology.*

Let T be a compact torus. Goresky, Kottwitz and Macpherson showed that for a large and interesting class of T -spaces X , the equivariant cohomology ring $H_T^*(X)$ can be encoded in a graph, now called a GKM-graph, with vertices corresponding to the fixed points of X and edges labeled by characters of T .

In this lecture, we explain how the GKM construction can be generalized to any finite T -CW complex. This generalization gives rise to new mathematical objects: GKM-hypergraphs and GKM-sheaves. If time permits, we will show how these methods were used to resolve a conjecture concerning the moduli space of flat connections over a non-orientable surface. (Received June 23, 2011)
