**Linyuan Lu** and **Kevin G Milans\*** (milans@math.wvu.edu). *Forbidden Induced Posets in the Boolean Lattice*. Preliminary report.

The Turán problem is at the core of extremal graph theory; we study an analogue for partially ordered sets, or posets. The induced Turán number  $\text{La}^*(n, P)$  is the maximum size of a family of elements in the  $n$ -dimensional Boolean lattice that does not contain  $P$  as an *induced* subposet. Boehnlein and Jiang obtained the asymptotics of  $\text{La}^*(n, P)$  when the Hasse diagram of  $P$  is a tree. Not much is known about  $\text{La}^*(n, P)$  when the Hasse diagram of  $P$  contains cycles. We present bounds on  $\text{La}^*(n, P)$  when  $P$  is a series-parallel poset or the standard example. This is joint work with Linyuan Lu. (Received September 04, 2012)
