, United Kingdom. *Almost split sequences for Knörr lattices*. Preliminary report.

Auslander and Reiten, some time ago, showed that the indecomposable modules for a finite dimensional algebra are naturally organized into a graph using the data of certain short exact sequences known as almost split sequences. Such sequences also exist for indecomposable RG -lattices where R is a p -adic ring, and G is a finite group. We show that under mild conditions, the almost split sequence for a Knörr RG -lattice has an indecomposable middle term. This is joint work with Nadia Mazza. (Received August 25, 2013)
