Preliminary report.

In this paper we will study a non-autonomous piece-wise linear difference equation which describes a discrete version of a single neuron model. We will investigate the periodic behavior of solutions relative to the periodic sequence with period three internal decay rate. We will show that only periodic cycles with period $3k$, $k = 1, 2, 3, \dots$ can exist and also show their stability character. (Received August 05, 2016)
