Christian Millichap and **William Worden*** (william.worden@temple.edu). *Hidden Symmetries and Commensurability of 2-bridge link complements.*

The canonical triangulations and symmetry groups of 2-bridge link complements are well understood and relatively easy to describe. We leverage this fact to show that non-arithmetic 2-bridge link complements have no hidden symmetries (i.e., symmetries of a finite cover that do not descend to symmetries of the link complement itself), and are pairwise incommensurable. This is joint work with Christian Millichap. (Received March 11, 2017)
