Zhisheng Shuai* (shuai@ucf.edu), Orlando, FL 32765. *A Graph-Theoretic Approach to Global Lyapunov Functions in Mathematical Biology*. Preliminary report.

The graph-theoretic approach has become a standard method to construct global Lyapunov functions for large-scale differential equation systems. Appropriate graph/network design and reduction is the key in the successful application of the approach. We illustrate these graph/network techniques using various models in the literature.
