Craig R Guilbault and **Molly A Moran*** (mmoran@coloradocollege.edu). *Generalized
Boundary Swapping.*

Bestvina formalized the concept of a group boundary by introducing the notion of a \mathcal{Z} -structure on a group. In this initial paper, Bestvina proved a boundary swapping theorem that can be applied to a group G with a finite $K(G, 1)$. We will present a generalization of this result that omits the requirement of a group action and weakens the type of map required to a coarse equivalence. (Received January 18, 2019)
