Alex Kunin, Caitlin Lienkaemper* (cul434@psu.edu) and **Zvi Rosen**. *Convex Neural Codes and Oriented Matroids*.

A combinatorial neural code is a subset of the power set $2^{[n]}$. A neural code is convex if it arises as the intersection pattern of convex open sets in \mathbb{R}^d . In the past few years, there has been considerable progress on characterizing which neural codes are convex, but the problem remains wide open. Here, we show that a code has a realization with convex polytopes if and only if it is the image of a representable oriented matroid under a neural code morphism. We show that most previously known examples of non-convex codes are non-convex because they are not the image of any oriented matroid under a code morphism. (Received September 07, 2019)
