Gabriel C. Drummond-Cole and **Philip Hackney*** (hackney@louisiana.edu). *Right adjoints to operadic restriction functors.*

If $\varphi : P \rightarrow Q$ is a morphism of operads, then there is a restriction functor from Q algebras to P algebras. This restriction functor generally admits a left adjoint. This restriction may or may not admit a right adjoint: if $G \rightarrow H$ is a group homomorphism, then the forgetful functor from H -sets to G -sets has a right adjoint, while there is no right adjoint to the functor from commutative algebras to associative algebras.

In this talk, we provide a concise necessary and sufficient condition for the existence of a right adjoint to the restriction functor, phrased in terms of the operad map φ . We give a simple formula for this right adjoint, and examine the criterion in special cases. All of this is applicable over quite general ground categories. (Received August 14, 2019)
