David Bachman*, 1050 N Mills Ave, Claremont, CA 91711, and **Jim Hoste**, CA. *All odd length polygonal knots are strip knots.* Preliminary report.

A *strip knot* is the surface formed by tying a knot in a strip of paper (not rubber!) and gluing the ends together. The centerline of the strip forms the core of the strip knot. A natural question is whether any embedding of S^1 into R^3 is the core of a strip knot. We show the answer is yes when the knot is piecewise linear with an odd number of segments.
