Strong quasiconvexity generalizes quasiconvexity in hyperbolic groups and it is preserved under quasi-isometry. It is well-known that quasiconvex subgroups of hyperbolic groups are finitely generated and have finite height (a generalization of almost malnormality). I prove that strongly quasiconvex subgroups of arbitrary finitely generated groups are also finitely generated and have finite height. Therefore, it may be interesting to ask if a finitely generated, finite height (or even almost malnormal) subgroup is strongly quasiconvex. I will talk about the answer to this question in 3-manifold groups. A part of my talk is joint work with Hoang Thanh Nguyen and Wenyuan Yang. (Received January 22, 2020)
