Cris Negron* (cnegron@email.unc.edu), University of North Carolina Chapel Hill. *Quantum groups at even order roots of unity.*

I will discuss unique phenomena for quantum groups at even order roots of unity. Here the small quantum group is not a Hopf subalgebra in Lusztig's divided power algebra, but a quasi-Hopf algebra constructed as a de-equivariantization of the "big quantum group" via the quantum Frobenius. We will discuss relations with conformal field theory. (Received August 25, 2020)
