It has been shown that there are infinite families of simply-connected 4-manifolds for which all primitive ordinary homology classes of square 1 are represented by topologically isotopic but smoothly distinct 2-spheres that become smoothly isotopic after one external stabilization. We will discuss examples of homologous 2-spheres of higher intersections that hold similar results and as an interesting feature, it will be seen that geometric intersections of any pair of these spheres must be larger than their algebraic intersections. This is joint work with Dave Auckly, Paul Melvin, and Daniel Ruberman. (Received August 31, 2020)
