*Residue field domination in some Henselian valued fields.*

The notion of the domination of a type by its stable part was introduced in the work of Haskell, Hrushovski, and Macpherson. In joint work with Haskell and Maříková, we showed that the key ingredient was not so much stability but the residue field, and we obtained similar results for real closed valued fields (where the residue field is unstable). Recently, with Haskell and Simon, we have generalized these results to Henselian valued fields of equicharacteristic zero with bounded Galois group. (Received February 04, 2020)
