Erkan Nane* (ezn0001@auburn.edu), 221 Parker Hall, Auburn, AL 36849. *Blow-up results for space-time fractional Dynamics.*

Consider non-linear time-fractional stochastic reaction-diffusion equations of the following type,

$$\partial_t^\beta u_t(x) = -\phi(-\Delta)u_t(x) + I_t^{1-\beta}[b(u) + \sigma(u) \dot{F}(t, x)]$$

in $(d+1)$ dimensions, where $\beta \in (0, 1)$, and the operator ∂_t^β is the Caputo fractional derivative while $\phi : (0, \infty) \rightarrow (0, \infty)$ is a Bernstein function, and $I_t^{1-\beta}$ is the Riesz fractional integral operator. The forcing noise denoted by $\dot{F}(t, x)$ is a Gaussian noise. These equations might be used as a model for materials with random thermal memory. We derive non-existence (blow-up) of global random field solutions under some additional conditions, most notably on b , σ and the initial condition.

These results are our recent joint work with Sunday Asogwa, Chansong Deng, Mohammud Foondun, Wei Liu, and Jebessa Mijena. (Received September 17, 2021)
