SPACES OF CONSTANT CURVATURE

SIXTH EDITION

JOSEPH A. WOLF

AMS CHELSEA PUBLISHING
American Mathematical Society • Providence, Rhode Island
Spaces of Constant Curvature

Sixth Edition
TO LOIS
PREFACE

This book grew out of lectures I gave at the University of California (Berkeley) in the spring semester of 1964. The lectures were planned to cover a specific and beautiful topic in riemannian geometry, the geometry of spaces of constant curvature, presenting known progress toward the solution of its outstanding problems. Halfway through the semester I was trapped by the subject and lingered on to solve a few of those problems. The state of the theory now warrants a book, and I hope that this is the book so warranted.

The theory of spaces of constant curvature might be said to have originated with euclidean geometry. But it really began with the Gauss-Lobatchevsky-Bolyai inventions of a non-euclidean geometry in the early nineteenth century. That geometry is now called the synthetic geometry of the hyperbolic plane. Its discovery marked the end of attempts to prove Euclid’s parallel postulate from the other postulates of euclidean geometry, for it has the property that (infinitely) many parallels to a given line pass through any point off that line. In 1854 Riemann invented two non-euclidean geometries with the property that two distinct lines cannot be parallel. Those geometries are now known as the synthetic plane spherical and elliptic geometries. At the same time Riemann laid the foundations for riemannian geometry and exhibited riemannian metrics of arbitrary given constant curvature. Then, in 1868, Beltrami proved the consistency of the hyperbolic and spherical geometries (relative to euclidean solid geometry) by realizing them as the intrinsic geometries of well-known surfaces in euclidean space. Those surfaces are the pseudosphere for hyperbolic geometry, which has constant negative curvature, and the ordinary sphere for spherical geometry, which has constant positive curvature. In addition to causing general acceptance of the non-euclidean geometries, Beltrami’s proof moved them into the domain of the then new riemannian geometry. Within a dozen years there was considerable interest in surfaces of constant curvature. In 1891, Killing published a book in which riemannian manifolds of arbitrary dimension and arbitrary constant curvature were exhibited and in which the problem of finding all riemannian manifolds of constant curvature was well formulated. That problem received additional impetus from Einstein’s invention of general relativity and was put in proper perspective by É. Cartan’s development of the theory of symmetric spaces.

The purpose of this book is to describe the classification problems in the theory of spaces of constant curvature and the theory of symmetric spaces. Results to date are given and a number of additional problems
are solved. The coverage is best explained by the following description
of the contents of this book and by reference to the table of contents.

The first half of the book (Parts I, II, and III) is concerned with spaces
of constant curvature \textit{per se}. The reader is expected to have some
familiarity with advanced calculus, point set topology, linear algebra,
and elementary group theory.

\textbf{Part I} (riemannian geometry) consists of two chapters. Chapter 1
develops the concepts of differentiable manifold and linear connection,
digresses for an exposition of the theory of covering spaces, and
concludes with a treatment of global affine differential geometry. The
results are essentially standard but many proofs are new. Chapter 2
develops the Levi-Civita connection and the concept of sectional
(riemannian) curvature, and touches on the geometry of spaces of
constant curvature. Then it illustrates the two main techniques of this
book, the first by the isometric classification of riemannian 2-manifolds
of constant curvature $K \geq 0$, and the second by the isometric classifi-
cation of riemannian homogeneous manifolds of arbitrary constant
curvature. These classifications are known but not standard.

\textbf{Part II} (the euclidean space form problem) consists of one chapter.
Chapter 3 describes the present state of the theory of flat (zero curvature)
complete riemannian manifolds by presenting the Bieberbach Theorems,
applying them to the euclidean space form problem, and using the
resulting structure theory to obtain the isometric classification of flat
complete riemannian 3-manifolds. That classification is new, although
it is only a refinement of other types of classifications of Nowacki and
Hantzsche-Wendt. The chapter ends by considering some lines of
research that look hopeful for the future.

\textbf{Part III} (the spherical space form problem) consists of four chapters.
It gives the isometric classification of complete riemannian manifolds of
constant positive curvature, solving the "Clifford-Klein spherical space
form problem" proposed by Killing in 1891. That solution is new, and
it forms the nucleus of this book. Chapter 4 is preparatory, developing
the representation theory of finite groups from the viewpoint of Frobenius' reciprocity. Chapter 5 develops elementary $p$-group theory
and then applies it with the representation theory to obtain Vincent's
partial solution to the spherical space form problem. Chapter 6 is the
classification of the family of finite groups which occurs in the spherical
space form problem. Chapter 7 is the synthesis, resulting in the
solution.

The second half of this book (Parts IV and V) deals with various
natural extensions of the class of spaces of constant curvature. The
pace is faster than in the first half, and the reader is expected to know
the basic facts on compact topological groups, Lie groups, and Lie
algebras.
PART IV (space form problems on symmetric spaces) consists of three chapters. It is concerned with the problem of extending the solution of the spherical space form problem to riemannian symmetric spaces of nonnegative curvature. Chapter 8 is a fairly complete introduction to riemannian symmetric spaces and two point homogeneous spaces. It contains the classification, including the linear isotropy representations, and a fair amount of new material toward the end. Chapter 9 extends the solution of the spherical space form problem to a large class of compact symmetric spaces, and Chapter 10 deals with symmetric spaces of non-negative curvature.

PART V (space form problems on indefinite metric manifolds) consists of two chapters. Chapter 11 is concerned with constant curvature indefinite metric manifolds, while Chapter 12 treats the generalization to indefinite metric of the two-point-homogeneous riemannian manifolds.

The working method in this book is a mixture of É. Cartan's method of moving frames and the theory of groups. Here I gratefully acknowledge my debt to my teacher S.-S. Chern, who stimulated and guided my interest in differential geometry. Thanks for guidance are also due A. A. Albert for teaching me how to sit down with an algebraic problem.

This book was originally written as a monograph but in part due to the selection of material has been used as a text. A number of people made useful suggestions which are incorporated into this edition, notably B. O'Neill, V. Ozols, R. E. Stong, W. Boothby and Wu-yi Hsiang. In contrast to the original 1967 edition, Chapter 1, Chapter 2 and the first half of Chapter 8 now form a reasonable introduction to differential geometry and symmetric spaces.

Special thanks are due to my wife Lois for her continuous encouragement and cooperation while I was writing and preparing revisions.

Berkeley, June 1977

J. A. W.
Since publication of the fifth (1984) edition of this book there has been a tremendous amount of activity in discrete subgroups of Lie groups and algebraic groups. This activity had emphasis in several areas, especially differential geometry, harmonic analysis, algebraic geometry and number theory. It also had applications via Fourier transform theory to signal processing and other areas.

Most of the new material in this sixth (2010) edition represents an attempt to indicate some of these developments. Much of this is done in Chapter 3 and in the Appendix to Chapter 12. Chapter 3 has some new results and an indication of updates in the section on flat homogeneous pseudo–riemannian manifolds. The Appendix to Chapter 12 sketches some background and a brief description (sometimes just consisting of current references) of the more recent work on discrete subgroups of real Lie groups. There the emphasis is on application to pseudo–riemannian geometry and pseudo–riemannian quotient manifolds, including of course the riemannian case. There has also been an enormous amount of work on spaces of functions on those quotients, but that is well beyond the scope of this book.

I thank Oliver Baues for his generous advice and updates concerning the revision of Chapter 3. Thanks also to Jonathan Wahl in connection with the change in the Remark on page 170. I was tempted to modernize the finite group theory in Chapter 6, but that could have made it inaccessible to many differential geometers, and I thank James Milgram and C. T. C. (Terry) Wall for convincing me not to do it. Finally, my thanks to Hillel Furstenberg, David Kazhdan and Toshiyuki Kobayashi for updates and references in the Appendix to Chapter 12.

In this new material, note that citations not in the 1986 “References” section are in “Additional References” just after.

As ever, special thanks are due to my wife Lois for her support while I was preparing this new edition.

_Berkeley, July 2010_  

_J. A. W._
NOTES TO THE READER

Sections are numbered within each chapter. Thus §3.2 is the second section of Chapter 3. Theorems, corollaries, formulae, etc., are numbered consecutively within each section, with chapter and section numbers given to facilitate cross reference. Thus Lemma 1.6.5 refers to the fifth numbered object of §1.6 and implies that it is a lemma; (2.4.12) refers to the twelfth numbered object in §2.4, which is a formula.

Numbers [n] in square brackets follow names and refer to the bibliography at the end of the book.

Chapter 3 is used in later chapters only in that Theorem 3.2.8 is needed in §10.1.

PART III (Chapters 4, 5, 6, and 7) is used in its sequel mainly by reference to the classification results of Chapter 7. This reference is made in Chapters 9 and 11. The only exception is that Theorems 6.1.11 and 6.3.1 are used in §11.2.

Chapter 6 is only used for its results (Theorems 6.1.11, 6.2.1, and 6.3.1), never for its methods—so the reader can feel free to skip the tedious argument of §6.2 if he is so inclined.

Chapters 1, 2, and 8 form a concise introduction to riemannian geometry and riemannian symmetric spaces.

Logical Interdependence of Chapters
CONTENTS

Prefaces . . vii, x

Notes to the Reader . . xi

PART I Riemannian Geometry . . . . 1

CHAPTER 1 Affine Differential Geometry . . . . . . 1
1.1 Differentiable manifolds . . . . 2
1.2 Vector fields . . . . . . 3
1.3 Differential forms . . . . . . 5
1.4 Maps . . . . . . 7
1.5 Lie groups . . . . . . 9
1.6 The frame bundle: parallelism and geodesics . . . . 14
1.7 Curvature, torsion and the structure equations . . . . 23
1.8 Covering spaces . . . . . . 31
1.9 The Cartan-Ambrose-Hicks Theorem . . . . 42

CHAPTER 2 Riemannian Curvature . . . . . . 45
2.1 The Levi-Civita connection . . . . . . 46
2.2 Sectional curvature . . . . . . 52
2.3 Isometries and curvature . . . . . . 57
2.4 Models for spaces of constant curvature . . . . 62
2.5 The 2-dimensional space forms . . . . . . 74
2.6 Finite rotation groups . . . . . . 83
2.7 Homogeneous space forms . . . . . . 88
2.8 Appendix: The metric space structure of a riemannian manifold . . . . . . 91

PART II The Euclidean Space Form Problem . . . . . . 97

CHAPTER 3 Flat Riemannian Manifolds . . . . . . 98
3.1 Discontinuous groups on euclidean space . . . . . . 98
3.2 The Bieberbach Theorems on crystallographic groups . . . . . . 100
3.3 Application to euclidean space forms . . . . . . 105
3.4 Questions of holonomy . . . . . . 107
3.5 Three dimensional euclidean space forms . . . . . . 111
3.6 Three attacks on the classification problem for flat compact manifolds . . . . . . 124
3.7 Flat homogeneous pseudo-riemannian manifolds . . . . . . 131
PART III  The Spherical Space Form Problem . . . 137
CHAPTER 4  Representations of Finite Groups . . . 138
4.1 Basic definitions . . . . . . . . . . . . . . . 138
4.2 The Frobenius-Schur relations . . . . . . 139
4.3 Frobenius reciprocity and the group algebra . 141
4.4 Divisibility . . . . . . . . . . . . . . . . . 145
4.5 Tensor products and dual representations . . . 147
4.6 Two lemmas on representations over algebraically
    non-closed fields . . . . . . . . . . . . . . . 150
4.7 Unitary and orthogonal representations . . . 151

CHAPTER 5  Vincent’s Work on the Spherical Space Form
            Problem . . . . . . . . . . . . . . . . . 154
5.1 Vincent’s program . . . . . . . . . . . . . . . 154
5.2 Preliminaries on $p$-groups . . . . . . . . . . . . 156
5.3 Necessary conditions on fixed point free groups . 159
5.4 Classification of the simplest type of fixed point
    free groups . . . . . . . . . . . . . . . . . 162
5.5 Representations of finite groups in which every
    Sylow subgroup is cyclic . . . . . . . . . . . . 165
5.6 A partial solution to the spherical space form
    problem . . . . . . . . . . . . . . . . . . . . . 171

CHAPTER 6  The Classification of Fixed Point Free Groups . 172
6.1 Zassenhaus’ work on solvable groups with cyclic
    odd Sylow subgroups . . . . . . . . . . . . . . . 173
6.2 The binary icosahedral group . . . . . . . . . . . 181
6.3 Non-solvable fixed point free groups . . . . . . 195

CHAPTER 7  The Solution to the Spherical Space Form
            Problem . . . . . . . . . . . . . . . . . 198
7.1 Representations of binary polyhedral groups . . . 198
7.2 Fixed point free complex representations . . . . . 203
7.3 The action of automorphisms on representations . . 211
7.4 The classification of spherical space forms . . . . . 218
7.5 Spherical space forms of low dimension . . . . . . 224
7.6 Clifford translations . . . . . . . . . . . . . . . 227

PART IV  Space Form Problems on Symmetric Spaces . 231
CHAPTER 8  Riemannian Symmetric Spaces . . . . . . . 231
8.1 Lie formulation of locally symmetric spaces . . . 232
8.2 Structure of orthogonal involutive Lie algebras . . 234
8.3 Globally symmetric spaces and orthogonal involu-
    tive Lie algebras . . . . . . . . . . . . . . . . 240
8.4 Curvature . . . . . . . . . . . . . . . . . . . . . 245
8.5 Cohomology ........................................... 247
8.6 Cartan subalgebras, rank and maximal tori .......... 252
8.7 Hermitian symmetric spaces .......................... 257
8.8 The full group of isometries ........................... 263
8.9 Extended Schl"afli-Dynkin diagrams ................. 264
8.10 Subgroups of maximal rank ......................... 275
8.11 The classification of symmetric spaces .......... 286
8.12 Two point homogeneous spaces ..................... 293
8.13 Appendix: Manifolds with irreducible linear isotropy group ... 300

CHAPTER 9 Space Forms of Irreducible Symmetric Spaces ........................................... 303
9.1 Feasibility of space form problems .................. 304
9.2 Grassmann manifolds as symmetric spaces ........... 306
9.3 Grassmann manifolds of even dimension ............. 307
9.4 Grassmann manifolds of odd dimension ............. 314
9.5 Symmetric spaces of positive characteristic ....... 319
9.6 An isolated manifold ................................... 325

CHAPTER 10 Locally Symmetric Spaces of Non-negative Curvature ...................................... 328
10.1 The structure theorems ................................ 329
10.2 Application of the structure theorems .............. 333

PART V Space Form Problems on Indefinite Metric Manifolds ........................................... 337

CHAPTER 11 Spaces of Constant Curvature .................. 337
11.1 The classification of finite space forms ............ 338
11.2 The geometry of pseudo-spherical space forms .... 341
11.3 Homogeneous finite space forms ..................... 347
11.4 The lattice space forms ................................ 354
11.5 A wild Lorentz signature ............................. 366
11.6 The classification for homogeneous manifolds of constant curvature ........ 370

CHAPTER 12 Locally Isotropic Manifolds ............................ 374
12.1 Reductive Lie groups .................................. 374
12.2 Examples of locally isotropic manifolds .......... 380
12.3 Structure of locally isotropic spaces ............... 385
12.4 A partial classification of complete locally isotropic manifolds ........ 389
Appendix to Chapter 12 .................................. 396
