Contents

Preface	vii
Chapter 1. Introduction	1
1.1. Introductory Remarks on Supersymmetry	1
1.2. Classical Mechanics and the Electromagnetic and Gravitational Fields	2
1.3. Principles of Quantum Mechanics	9
1.4. Symmetries and Projective Unitary Representations	17
1.5. Poincaré Symmetry and Particle Classification	23
1.6. Vector Bundles and Wave Equations: The Maxwell, Dirac, and Weyl Equations	37
1.7. Bosons and Fermions	48
1.8. Supersymmetry as the Symmetry of a \mathbf{Z}_2 -Graded Geometry	51
1.9. References	52
Chapter 2. The Concept of a Supermanifold	59
2.1. Geometry of Physical Space	59
2.2. Riemann's Inaugural Talk	63
2.3. Einstein and the Geometry of Spacetime	66
2.4. Mathematical Evolution of the Concept of Space and Its Symmetries	67
2.5. Geometry and Algebra	72
2.6. A Brief Look Ahead	76
2.7. References	79
Chapter 3. Super Linear Algebra	83
3.1. The Category of Super Vector Spaces	83
3.2. The Super Poincaré Algebra of Gol'fand-Likhtman and Volkov-Akulov	90
3.3. Conformal Spacetime	95
3.4. The Superconformal Algebra of Wess and Zumino	108
3.5. Modules over a Supercommutative Superalgebra	113
3.6. The Berezinian (Superdeterminant)	116
3.7. The Categorical Point of View	119
3.8. References	124
Chapter 4. Elementary Theory of Supermanifolds	127
4.1. The Category of Ringed Spaces	127

4.2. Supermanifolds	130
4.3. Morphisms	138
4.4. Differential Calculus	143
4.5. Functor of Points	150
4.6. Integration on Supermanifolds	152
4.7. Submanifolds: Theorem of Frobenius	157
4.8. References	167
Chapter 5. Clifford Algebras, Spin Groups, and Spin Representations	169
5.1. Prologue	169
5.2. Cartan's Theorem on Reflections in Orthogonal Groups	174
5.3. Clifford Algebras and Their Representations	178
5.4. Spin Groups and Spin Representations	192
5.5. Spin Representations as Clifford Modules	203
5.6. References	208
Chapter 6. Fine Structure of Spin Modules	211
6.1. Introduction	211
6.2. The Central Simple Superalgebras	212
6.3. The Super Brauer Group of a Field	222
6.4. Real Clifford Modules	227
6.5. Invariant Forms	236
6.6. Morphisms from Spin Modules to Vectors and Exterior Tensors	250
6.7. The Minkowski Signature and Extended Supersymmetry	256
6.8. Image of the Real Spin Group in the Complex Spin Module	262
6.9. References	272
Chapter 7. Superspacetimes and Super Poincaré Groups	273
7.1. Super Lie Groups and Their Super Lie Algebras	273
7.2. The Poincaré-Birkhoff-Witt Theorem	279
7.3. The Classical Series of Super Lie Algebras and Groups	289
7.4. Superspacetimes	294
7.5. Super Poincaré Groups	299
7.6. References	299

Preface

These notes are essentially the contents of a minicourse I gave at the Courant Institute in the fall of 2002. I have expanded the lectures by discussing spinors at greater length and by including treatments of integration theory and the local Frobenius theorem, but otherwise have not altered the plan of the course. My aim was and is to give an introduction to some of the mathematical aspects of supersymmetry with occasional physical motivation. I do not discuss supergravity.

Not much is original in these notes. I have drawn freely and heavily from the beautiful exposition of P. Deligne and J. Morgan, which is part of the AMS volumes on quantum field theory and strings for mathematicians, and from the books and articles of D. S. Freed and D. A. Leites, all of which and more are referred to in the introduction.

I have profited greatly from the lectures that Professor S. Ferrara gave at UCLA as well as from many extended conversations with him, both at UCLA and at CERN, where I spent a month in 2001. He introduced me to this part of mathematical physics and was a guide and participant on a seminar on supersymmetry that I ran in UCLA in 2000 with Rita Fioresi. I am deeply grateful to him for his unflinching patience and courtesy. I also gave a course in UCLA and a miniworkshop on supersymmetry in 2000 in Genoa, Italy, in the Istituto Nazionale di Fisica Nucleare. I am very grateful to Professors E. Beltrametti and G. Cassinelli, who arranged that visit; to Paolo Aniello, who made notes of my UCLA course; to Ernesto De Vito and Alberto Levrero, whose enthusiasm and energy made the Genoa workshop so memorable; and finally to Lauren Caston, who participated in the Courant course with great energy and enthusiasm. I also wish to thank Alessandro Toigo and Claudio Carmeli of INFN, Genoa, who worked through the entire manuscript and furnished me with a list of errors and misprints in the original version of the notes, and whose infectious enthusiasm lifted my spirits in the last stages of this work. I am very grateful to Julie Honig for her help during all stages of this work. Last, but not least, I wish to record my special thanks to Paul Monsour and Reeva Goldsmith whose tremendous effort in preparing and editing the manuscript has made this book enormously better than what it was when I sent it to them.

The course in the Courant Institute was given at the suggestion of Professor S. R. S. Varadhan. My visit came at a time of mourning and tragedy for him in the aftermath of the 9/11 catastrophe, and I do not know how he found the time and energy to take care of all of us. It was a very special time for us and for him, and in my mind this course and these notes will always appear as a small effort on my part to alleviate the pain and grief by thinking about some beautiful things that are far bigger than ourselves.

Supersymmetry for Mathematicians: An Introduction

V. S. VARADARAJAN

Supersymmetry has been the object of study by theoretical physicists since the early 1970's. In recent years it has attracted the interest of mathematicians because of its novelty, and because of significance, both in mathematics and physics, of the main issues it raises.

This book presents the foundations of supersymmetry to the mathematically minded reader in a cogent and self-contained manner. It begins with a brief introduction to the physical foundations of the theory, especially the classification of relativistic particles and their wave equations, such as the equations of Dirac and Weyl. It then continues the development of the theory of supermanifolds stressing the analogy with the Grothendieck theory of schemes. All the super linear algebra needed for the book is developed here and the basic theorems are established: differential and integral calculus in supermanifolds, Frobenius theorem, foundations of the theory of super Lie groups, and so on. A special feature of the book is the treatment in depth of the theory of spinors in all dimensions and signatures, which is the basis of all developments of supergeometry both in physics and mathematics, especially in quantum field theory and supergravity.
