CONTENTS

Viscosity solutions on Lagrangian manifolds and connections with tunnelling operators
D. McCaffrey 221

Applications of the generated pseudo-analysis to nonlinear partial differential equations
Endre Pap 239

A generalization of the utility theory using a hybrid idempotent-probabilistic measure
Endre Pap 261

Amoebas: Their spines and their contours
MiKael Passare and August TsiKh 275

First steps in tropical geometry
Jürgen Richter-Gebert, Bernd Sturmfels, and Thorsten Theobald 289

On minimax and idempotent generalized weak solutions to the Hamilton-Jacobi equation
Ilya V. Roublev 319

Dequantisation: Semi-direct sums of idempotent semimodules
Edouard Wagneur 339

On (min, max, +)-inequalities
Jacob van der Woude and Geert Jan Olsder 353

Solution of some max-separable optimization problems with inequality constraints
Karel Zimmermann 363
Preface

Idempotent mathematics is a new branch of mathematical sciences, rapidly developing and gaining popularity over the last decade; it is also closely related to mathematical physics. The literature on the subject is vast and includes numerous books and an all but innumerable body of journal papers; a wide sample of references can be found in G. L. Litvinov’s introductory paper and other papers published in this volume.

An important stage of development of the subject was presented in the book *Idempotency* edited by J. Gunawardena (Publ. of the Newton Institute, Vol. 11, Cambridge University Press, Cambridge, 1998). This book arose out of the well-known workshop that was held in Bristol, England, in October 1994.

To snapshot modern idempotent mathematics at a new stage of its development, we have organized a workshop on *Idempotent Mathematics and Mathematical Physics* hosted by the Erwin Schrödinger Institute for Mathematical Physics in Vienna, Austria, in February 2003. The present volume provides an extended record of this meeting along with a number of invited contributions. We believe that the table of contents is self-explanatory.

It is a pleasure to thank the Erwin Schrödinger Institute for Mathematical Physics, American Mathematical Society and Russian Fund for Basic Research (grant 02–01–01062) for their important support. We are grateful to Sergei Gelfand and Christine Thivierge of the American Mathematical Society, to Peter Michor, Klaus Schmidt, and Maria Windhager of the Erwin Schrödinger Institute, as well as to all the officers of this Institute, and to a number of colleagues, especially to Andrei Sobolevskii of the Moscow State University, for their great help. We thank all the authors of this volume and members of our “idempotent/max-plus/tropical community” for their contributions, help, and useful contacts.

_G. L. Litvinov and V. P. Maslov_

_Moscow, December 2004_
Idempotent mathematics is a rapidly developing new branch of the mathematical sciences that is closely related to mathematical physics. The existing literature on the subject is vast and includes numerous books and journal papers.

A workshop was organized at the Erwin Schrödinger Institute for Mathematical Physics (Vienna) to give a snapshot of modern idempotent mathematics. This volume contains articles stemming from that event. Also included is an introductory paper by G. Litvinov and additional invited contributions.

The resulting volume presents a comprehensive overview of the state of the art. It is suitable for graduate students and researchers interested in idempotent mathematics and tropical mathematics.
