ABSTRACT. The Atiyah–Singer index theorem marked the beginning of a rapidly developing area, which can be characterized as applications of functional analysis and differential operators to the study of topological invariants of differentiable manifolds. In recent years, the list of available functional tools grew significantly, including, in particular, Banach algebras and noncommutative geometry. The authors describe some of the developments in this direction.

The book can be viewed as an introduction to the topic. It presents the modern introduction to the index theory for elliptic operators, cyclic cohomology, and noncommutative geometry. As an application, the authors describe the functional analysis approach to the proof of the Novikov conjecture on higher signatures.

The book can be used by graduate students and research mathematicians working in differential geometry, differential topology, and functional analysis.

## Preface

The theorem on the index of an elliptic operator proved by Atiyah and Singer at the beginning of the sixties has initiated a quickly developing field of research, which can be briefly described as the study of topological invariants of manifolds using methods of functional analysis and the theory of differential operators. Some classical results such as the Hodge theory of harmonic forms and the Riemann–Roch theorem in the Hirzebruch formulation have become part of it in a natural way.

In the subsequent three decades research in this area has led to a series of remarkable results. At the same time, the variety of functional methods used here has increased considerably. In particular, Banach algebras and noncommutative differential geometry were used intensively. The main part of the theory has acquired rather precise outlines; moreover, the variety of its external connections and applications expanded, including even some areas of mathematical physics.

The main goal of our book is to introduce the reader to some of these methods, and also to the concrete topological problems solved with their help. An exhaustive description of functional methods in the topology of manifolds would deal with a large number of mathematical theories and would take several volumes. The present work has more modest purposes: it is devoted only to an introduction to the subject and can serve as the first step leading to the study of original works and specialized monographs.

The limited volume of the book has forced us to exclude the presentation of a series of interesting problems. Some of them were entirely omitted others are only discussed briefly. Nevertheless, we hope that what remains is enough to give a connected picture of the subject, at least of its most important parts.

Now we briefly describe the contents of the book.

In the first chapter  $K$ -theory, in terms of which the basic index theorem will be formulated, is described. In Section 1.1 some necessary information from homology algebra is presented. In Section 1.2, Hilbert modules are defined. They play the role of Hilbert spaces, in particular, Sobolev spaces, in  $C^*$ -index theory. Further, the corresponding analogs of compact operators are introduced, and their basic properties are proved. Finally, a technical theorem about averaging by means of a compact Lie group  $G$  acting on the space of operators for a Hilbert module is proved. Most of the results of this section were obtained in the papers [134, 133, 92, 96, 69, 34], while the basic information is contained in [107, 78, 38]. Section 1.3 is devoted to equivariant  $K$ -theory, defined from a projective module over a unital  $C^*$ -algebra  $A$  and from the corresponding bundles. After recalling the basic information about Clifford algebras, we define  $K$ -groups following the ideas of [57] and derive their main properties. An important computational tool of equivariant  $K$ -theory is the use of spectral sequences. A description of  $K$ -groups via classifying spaces is

obtained. For this purpose the theory of Fredholm operators is developed, and an appropriate analog of the Kuiper theorem is applied. Finally, the theorem on the Thom isomorphism in our  $K$ -theory is proved. The papers [96, 134, 132, 135] were the principal source of our presentation. In the last section of this chapter, two approaches to  $KK$ -theory are described: the original approach of Kasparov [70] and the approach of Cuntz [27].

The second chapter is devoted to the proof of the equivariant index theorem for  $C^*$ -elliptic operators [135]. In the first section the necessary calculus of pseudo-differential operators over an algebra  $A$  and analytical index theory are developed. The proof of the theorem itself is contained in Section 2.2. In the last section, the proof of the classical Atiyah–Singer theorem is presented. It becomes a special case of the  $C^*$ -theorem (when  $A = \mathbb{C}$ ).

The third chapter is devoted to one of the central problems of differential topology: the description of all homotopy invariant rational Pontryagin classes of smooth non-simply-connected manifolds. The classification of smooth structures on a non-simply-connected manifold of given homotopy type created in the mid-sixties by S. P. Novikov and C. T. C. Wall has allowed us to prove that homotopy invariant rational Pontryagin numbers of a non-simply-connected manifold can be only rather special characteristic numbers, which are called higher signatures. In the papers [103, 104] S. P. Novikov conjectured the homotopy invariance of higher signatures. Among various approaches to the proof of this conjecture, the direction based on methods of functional analysis, finite-dimensional and infinite-dimensional representations of the fundamental group developed rather quickly. In a series of papers [88, 89, 90] A. S. Mishchenko created the theory of algebraic surgery and introduced an important homotopy invariant of non-simply-connected manifolds, known as the symmetric signature. This theory has become a necessary part of the most successful studies of the problem of higher signatures.

The first section of the third chapter contains the necessary information on the theory of characteristic classes of smooth manifolds. In the second section, higher signatures are introduced and the Novikov conjecture is formulated. The third section contains the necessary facts on Hermitian  $K$ -theory, the theory of algebraic Poincaré complexes, and Fredholm representations of algebras with involution. Central in the chapter is the fourth section, devoted to the proof of the generalized Hirzebruch formulas due to Mishchenko. In the fifth section, the Mishchenko theorem about the homotopy invariance of higher signatures is proved for fundamental groups with the following property: the classifying spaces of these groups are complete Riemannian manifolds with metric of nonpositive curvature. In the fourth and fifth sections we follow Mishchenko's paper [91]. In the sixth section the homotopy invariance of higher signatures is proved for fundamental groups isomorphic to discrete subgroups of linear algebraic groups over local locally compact fields [121, 122]. The seventh section of the chapter is devoted to the approach of G. G. Kasparov to the problem of higher signatures. We consider, in particular, another proof of the basic theorem in the fifth section, mainly following the presentation in [65]. In the final section, some applications of the Dirac operator to the problem of positive curvature of spinor manifolds are considered [113, 135].

In the first section of the fourth chapter the fundamentals of noncommutative differential geometry and the theory of homology with inner symmetries, including cyclic and dihedral homology, are presented. Here we principally follow [22, 80, 123]. In the second section this theory and the  $C^*$ -index theorem are

applied to constructing the theory of generalized Lefschetz numbers [136]. In the final section, applying the same results, we give a sketch of the proof by Connes and Moscovici [24] of the Novikov conjecture for a class of groups including the hyperbolic groups of Gromov.

Now a few words about topics not included in the book. First of all, these are various approaches to the proof of the index theorem. Our proof of the index theorem for equivariant  $C^*$ -elliptic operators follows the classical lines of the work of Atiyah and Singer.

The set of problems related to the approach based on the heat equation is not considered in the book. The detailed presentation of these problems can be found in [41, 111, 8].

It is possible to study one more proof, which uses methods of probability theory, given in the work of Bismut [9].

Some interesting generalizations of the index theorem to elliptic operators on noncompact manifolds have appeared in the last decade. They use either so-called bounded geometry or some new cohomology theories ( $L^2$  cohomology and “coarse cohomology”). It is possible to find the principal results obtained in this direction in [36, 35, 112, 47]. One more approach to noncompact theory of the index is based on the use of foliations with noncompact leaves [99, 22, 25].

There is a long list of literature devoted to generalizations of the index theorem to nonsmooth manifolds [129, 130, 128, 131, 117]. The works on the index for orbifolds and similar objects follow the same purpose (see the survey [140]).

The theory of the index is intensively developing now in the so-called algebraic direction, essentially using the formalism of cohomology theories of cyclic type obtained in a series of interesting papers of Cuntz and Quillen [29, 31, 30]. Their results have led Nistor to a new proof of the theorem of Connes–Moscovici [102]. Among the other results of this direction, let us emphasize the work of Nest and Tsygan on the algebraic index theorem (see [101] and the bibliography therein).

Our book essentially contains only an introduction to the  $KK$ -theory of Kasparov. A detailed exposition of this theory and its various applications can be found in [71, 120, 54]. Various aspects of  $K$ -theory and homology of Banach algebras is contained in [10, 50, 139]. Many parts of the theory presented here were developed in the context of real algebras [49].

Two volumes of the recently published transactions of the conference in Oberwolfach [37] can serve as an excellent survey, devoted to the modern state of the Novikov conjecture on higher signatures, in which, in particular, a rather complete bibliography on this problem is presented.

The preparation of the book was a difficult and long matter, and many specialists have helped us in this work. First of all we are indebted to our teacher, Professor A. S. Mishchenko, for making us familiar with functional methods in differential topology and stimulating our research in this field. We had a number of useful contacts on problems considered in the book with I. K. Babenko, V. V. Belokurov, Yu. G. Borisovich, L. G. Brown, J. Cuntz, A. T. Fomenko, T. Friedrich, E. A. Gorin, M. L. Gromov, A. Ya. Helemskii, A. A. Irmatov, J. Kaminker, M. Karoubi, G. G. Kasparov, V. M. Manuilov, A. V. Mikhalev, A. I. Nemytov, R. Nest, V. Nistor, M. M. Postnikov, A. Ranicki, J. Rosenberg, E. T. Shavgulidze, G. Skandalis, B. L. Tsygan, A. Vallette, I. A. Volodin, and S. Weinberger.

A significant part of the book is based on lectures of the second author at the University of Greifswald (Germany), where he enjoyed the hospitality of Professor J. Eichhorn with the support of the German Service of Academic Interchange (DAAD).

- Kasparov
  - compact operator in the sense of 11
  - definition of  $KK$ -groups 69
  - product 70
- Kronecker product 172
- Künneth formula 2
- Lefschetz number
  - of the first type 188
  - of the second type 195
  - of the type  $2l$  199
- local operator 79
- locally in  $CZ_r$  97
- manifold
  - $\pi$ -special 128
  - special 126
- Mishchenko
  - compact operator in the sense of 11
  - symmetric signature 135
- module
  - simplicial 3
    - homology of 3
    - morphism of 3
    - product of 4
- Morita equivalence (invariance) 162
- morphism
  - compact 46
  - direct 47
- number
  - Chern 122
  - Pontryagin 122
- operator
  - adjoint 7
  - cyclic 168
  - degeneracy 3
  - differential 79
    - elliptic 81
      - in partial derivatives 81
      - symbol of 80
      - universal 80
    - elliptic 100, 102
      - order of 102
    - face 3
    - $G$ - $A$ -Fredholm 36
      - index of 36
    - homotopy 71
    - local 79
    - of Calderon-Zygmund 95, 99
    - of exterior derivative 170
  - periodic vector 22
  - periodicity
    - homomorphism 169
      - of Bott 24
  - Poincaré duality in  $K$ -homology 157
  - Pontryagin
    - characteristic class 121
    - number 122
  - positive square root 5
  - product
    - $C^*$  free 71
    - Kasparov 70
    - Kronecker 172
    - reduced crossed 157
    - tensor
      - external 11
      - internal 11
      - of  $DG$  algebras 176
  - quasi-homomorphism 71
  - quasi-isomorphism 1
  - quasilocal map 97
  - reduced crossed product 157
  - Rellich chain 84
  - representation
    - Fredholm 131
  - Seeley algebra 100
  - sequence
    - Connes exact 170
    - multiplicative 125
  - signature 126
    - generalized 135
    - higher 128
    - Mishchenko symmetric 135
    - of an Hermitian form with respect to a representation 131
  - subcategory
    - ideal 47
  - subsymbol 187
  - support 97
  - symbol 95
    - elliptic 100
      - for Tits system 186
      - primitive 187
      - of order  $r$  96, 97, 99
  - symmetrization 19
  - Thom homomorphism 57, 58
  - transplantation 97
  - universal coefficients formula 2
  - Wall groups
    - even-dimensional 129
    - odd-dimensional 130
  - $\mathcal{P}(A)$  5
  - pairing
    - Chern-Connes 173

## Selected Titles in This Series

*(Continued from the front of this publication)*

- 156 **V. N. Shevchenko**, Qualitative topics in integer linear programming, 1997
- 155 **Yu. Safarov and D. Vassiliev**, The asymptotic distribution of eigenvalues of partial differential operators, 1997
- 154 **V. V. Prasolov and A. B. Sossinsky**, Knots, links, braids and 3-manifolds. An introduction to the new invariants in low-dimensional topology, 1997
- 153 **S. Kh. Aranson, G. R. Belitsky, and E. V. Zhuzhoma**, Introduction to the qualitative theory of dynamical systems on surfaces, 1996
- 152 **R. S. Ismagilov**, Representations of infinite-dimensional groups, 1996
- 151 **S. Yu. Slavyanov**, Asymptotic solutions of the one-dimensional Schrödinger equation, 1996
- 150 **B. Ya. Levin**, Lectures on entire functions, 1996
- 149 **Takashi Sakai**, Riemannian geometry, 1996
- 148 **Vladimir I. Piterbarg**, Asymptotic methods in the theory of Gaussian processes and fields, 1996
- 147 **S. G. Gindikin and L. R. Volevich**, Mixed problem for partial differential equations with quasihomogeneous principal part, 1996
- 146 **L. Ya. Adrianova**, Introduction to linear systems of differential equations, 1995
- 145 **A. N. Andrianov and V. G. Zhuravlev**, Modular forms and Hecke operators, 1995
- 144 **O. V. Troshkin**, Nontraditional methods in mathematical hydrodynamics, 1995
- 143 **V. A. Malyshev and R. A. Minlos**, Linear infinite-particle operators, 1995
- 142 **N. V. Krylov**, Introduction to the theory of diffusion processes, 1995
- 141 **A. A. Davydov**, Qualitative theory of control systems, 1994
- 140 **Aizik I. Volpert, Vitaly A. Volpert, and Vladimir A. Volpert**, Traveling wave solutions of parabolic systems, 1994
- 139 **I. V. Skrypnik**, Methods for analysis of nonlinear elliptic boundary value problems, 1994
- 138 **Yu. P. Razmyslov**, Identities of algebras and their representations, 1994
- 137 **F. I. Karpelevich and A. Ya. Kreinin**, Heavy traffic limits for multiphase queues, 1994
- 136 **Masayoshi Miyanishi**, Algebraic geometry, 1994
- 135 **Masaru Takeuchi**, Modern spherical functions, 1994
- 134 **V. V. Prasolov**, Problems and theorems in linear algebra, 1994
- 133 **P. I. Naumkin and I. A. Shishmarev**, Nonlinear nonlocal equations in the theory of waves, 1994
- 132 **Hajime Urakawa**, Calculus of variations and harmonic maps, 1993
- 131 **V. V. Sharko**, Functions on manifolds: Algebraic and topological aspects, 1993
- 130 **V. V. Vershinin**, Cobordisms and spectral sequences, 1993
- 129 **Mitsuo Morimoto**, An introduction to Sato's hyperfunctions, 1993
- 128 **V. P. Orevkov**, Complexity of proofs and their transformations in axiomatic theories, 1993
- 127 **F. L. Zak**, Tangents and secants of algebraic varieties, 1993
- 126 **M. L. Agranovskiĭ**, Invariant function spaces on homogeneous manifolds of Lie groups and applications, 1993
- 125 **Masayoshi Nagata**, Theory of commutative fields, 1993
- 124 **Masahisa Adachi**, Embeddings and immersions, 1993
- 123 **M. A. Akivis and B. A. Rosenfeld**, Élie Cartan (1869–1951), 1993
