Tools for PDE
Pseudodifferential Operators,
Paradifferential Operators,
and Layer Potentials

Michael E. Taylor
ABSTRACT. This book develops three related tools that are useful in the analysis of partial differential equations, arising from the classical study of singular integral operators: pseudodifferential operators, paradifferential operators, and layer potentials.

A theme running throughout the work is the treatment of PDE in the presence of relatively little regularity. In the first chapter we study classes of pseudodifferential operators whose symbols have a limited degree of regularity. In the second chapter we show how paradifferential operators yield sharp estimates on various nonlinear operators on function spaces. In Chapter 3 we apply this material to an assortment of results in PDE, including regularity results for elliptic PDE with rough coefficients, planar fluid flows on rough domains, estimates on Riemannian manifolds given weak bounds on the Ricci tensor, div-curl estimates, and results on propagation of singularities for wave equations with rough coefficients. Chapter 4 studies the method of layer potentials on Lipschitz domains, concentrating on applications to boundary problems for elliptic PDE with variable coefficients.

Preface ix

Chapter 1. Pseudodifferential Operators with Mildly Regular Symbols 1
  §1. Spaces of continuous functions 3
  §2. Operator estimates on $L^p$, $h^1$, and bmo 17
  §3. Symbol classes and symbol smoothing 31
  §4. Operator estimates on Sobolev-like spaces 37
  §5. Operator estimates on spaces $C^{(\lambda)}$ 44
  §6. Products 54
  §7. Commutator estimates 58
  §8. Operators with Sobolev coefficients 61
  §9. Operators with double symbols 63
  §10. The CRW commutator estimate 75
  §11. Operators with vmo coefficients 78
  §12. Estimates on a class of Besov spaces 82
  §13. Operators with coefficients in a function algebra 86
  §14. Some BKM-type estimates 88
  §15. Variations on an estimate of Tumanov 92
  §16. Estimates on Morrey-type spaces 94

Chapter 2. Paradifferential Operators and Nonlinear Estimates 101
  §1. A product estimate 105
  §2. A commutator estimate 106
  §3. Some handy estimates involving maximal functions 108
  §4. A composition estimate 110
  §5. More general composition estimate 112
  §6. Continuity of $u \mapsto f(u)$ on $H^{1,p}$ 113
  §7. Estimates on $F(u) - F(v)$ 116
  §8. A pseudodifferential operator estimate 118
  §9. Paradifferential operators on the spaces $C^{(\lambda)}$ 120
  §A. Paracomposition 125
  §B. Alinhac’s lemma 132

Chapter 3. Applications to PDE 135
  §1. Interior elliptic regularity 137
  §2. Some natural first-order operators 148
  §3. Estimates for the Dirichlet problem 155
  §4. Layer potentials on $C^{1,\omega}$ surfaces 159
§5. Parametrix estimates and trace asymptotics 173
§6. Euler flows on rough planar domains 178
§7. Persistence of solutions to semilinear wave equations 183
§8. Div-curl estimates 186
§9. Harmonic coordinates 194
§10. Riemannian manifolds with bounded Ricci tensor 202
§11. Propagation of singularities 205

Chapter 4. Layer Potentials on Lipschitz Surfaces 217
§1. Cauchy kernels on Lipschitz curves 218
§2. The method of rotations and extensions to higher dimensions 228
§3. The variable-coefficient case 230
§4. Boundary integral operators 235

Preface

Since the early part of the twentieth century, with the work of Fredholm, Hilbert, Riesz, et al., the use of singular integral operators has developed into a range of tools for the study of partial differential equations. This includes the use of single and double layer potentials on planar curves to treat classical boundary problems for the Laplace operator on a planar region and higher-dimensional extensions. It also includes the construction of parametries for elliptic PDE with variable coefficients. Fourier integral representations of these operators have provided many useful insights, though this method has not entirely supplanted the singular integral representation. When the use of the Fourier integral representation is emphasized, the operators are often referred to as pseudodifferential operators. Paradifferential operators form a singular class of pseudodifferential operators, particularly suited for applications to nonlinear PDE.

Treatments of pseudodifferential operators most frequently concentrate on operators with smooth coefficients, but there has been a good bit of work on operators with symbols of minimal smoothness, with applications to diverse problems in PDE, from nonlinear problems to problems in nonsmooth domains. In this monograph we discuss a number of facets of the operator calculi that have arisen from the study of pseudodifferential operators, paradifferential operators, and layer potentials, with particular attention to the study of nonsmooth structures.

In Chapter I we study pseudodifferential operators whose symbols have a limited degree of regularity. We consider various cases, including measures of regularity just barely better (or just barely worse) than merely continuous, measures either a little better or a little worse than Lipschitz, and others. Function spaces used to describe the degree of regularity of symbols include

\[ C^\omega, \quad C^{(\lambda)}, \quad L^\infty \cap \text{vmo}, \quad B_{p,1}^s. \]

Here \( C^\omega \) consists of functions with modulus of continuity \( \omega \). The space \( C^{(\lambda)} \), with \( \lambda(j) = \omega(2^{-j}) \), is defined in terms of estimates on a Littlewood-Paley decomposition of a function. These spaces coincide for Hölder-Zygmund classes of functions, but they diverge in other cases. The space \( \text{vmo} \) is the space of functions of vanishing mean oscillation, and \( B_{p,1}^s \) are certain Besov spaces. The interplay between some of these function spaces is itself a significant object of study in this chapter.

The class of paradifferential operators, introduced in [Bon], has had a substantial impact on nonlinear analysis. In Chapter II we make use of paradifferential operator calculus to establish various nonlinear estimates, some of which have previously been established from other points of view. My interest in organizing some of this material, particularly in \$\S\$1–5, was stimulated by correspondence with T. Kato.
Other material in Chapter II includes investigations of paradifferential operators on the new function spaces $C^{(\lambda)}$.

Chapter III gives a sample of applications of some of the results of Chapters I–II to topics in PDE. We treat some linear PDE with rough coefficients, including some natural differential operators arising on Riemannian manifolds with non-smooth metric tensors. We consider the method of layer potentials on domains that are not smooth (though not so rough as those considered in Chapter IV). We also treat a couple of topics in nonlinear PDE, including inviscid, incompressible fluid flow on rough planar domains and wave equations with quadratic nonlinearities. We also discuss various div-curl estimates, including a number of estimates of [CLMS]. Some of the work in this section, especially variable-coefficient results, grew out of correspondence with P. Auscher, following up on our work in [AT]. Other topics studied in Chapter III include the construction of harmonic coordinates on Riemannian manifolds with limited smoothness, regularity results for the metric tensor of a Riemannian manifold when one has estimates on the Ricci tensor, and propagation of singularities for PDE whose coefficients are more singular than $C^{1,1}$, but which still have well defined null bicharacteristics by virtue of Osgood's theorem.

Chapter IV deals with the method of layer potentials on Lipschitz domains. We establish the fundamental estimates of Cauchy integrals on Lipschitz curves of [Ca2] and [CMM] (via a method of [CJS]) and extensions to higher dimensions from [CDM]. We then discuss the Dirichlet problem for Laplace equations and variants on Lipschitz domains. We consider operators with variable coefficients, hence Lipschitz domains in Riemannian manifolds. Our treatment of this follows [MT], though here we restrict attention to the simpler case of smooth coefficients, whereas [MT] treats cases arising from $C^1$ metric tensors. This extends earlier work of [Ve] and others on the flat Laplacian on Lipschitz domains in Euclidean space.

Prerequisites for this work include an acquaintance with basic results on pseudodifferential operators and some methods from harmonic analysis, including the Littlewood-Paley theory. Sufficient material on these prerequisites could be obtained from either [T2] or Chapters 7 and 13 of [T5]. Indeed, this present work can be viewed as a companion to [T2].

List of Symbols

Various function spaces and other objects occur in this monograph, labeled by the following special symbols. We give the chapter and formula number where each one is introduced.

\[ A^{r}_{0} S^{m}_{1,\delta} \quad \text{I (3.34)} \]
\[ BMO \quad \text{I (2.83)} \]
\[ bmo \quad \text{I (2.84)} \]
\[ BS^{m}_{1,1} \quad \text{I (2.72), (3.37)} \]
\[ B^{\psi}_{m,1} \quad \text{I (3.36)} \]
\[ B^{p}_{s,1} \quad \text{I (0.14)} \]
\[ B^{p}_{s,q} \quad \text{I (12.1)} \]
\[ C^{(\lambda)} \quad \text{I (0.2), (1.4)} \]
\[ C^{(\lambda)} S^{m}_{1,0} \quad \text{I (2.45)} \]
\[ C^{(\lambda)} S^{\psi}_{1,1} \quad \text{I (5.75)} \]
\[ C^{\omega} \quad \text{I (0.1)} \]
\[ C^{[\omega]} \quad \text{I (0.3), (1.61)} \]
\[ C^{(\omega)} \quad \text{I (0.4), (1.64)} \]
\[ C^{r} \quad \text{I (1.21)} \]
\[ C^{r, (\lambda)} \quad \text{I (5.57)} \]
\[ C^{r}_{s} S^{m}_{1,0} \quad \text{I (4.40)} \]
\[ D_{TF} \quad \text{III (2.1)} \]
\[ H^{\alpha,p} \quad \text{I (4.3)} \]
\[ H^{s,1} \quad \text{I (4.51)} \]
\[ H^{s,\infty} \quad \text{I (4.51)} \]
\[ H^{1} (\mathbb{R}^{n}) \quad \text{I (2.60)} \]
\[ h^{1} (\mathbb{R}^{n}) \quad \text{I (2.62)} \]
\[ (L^{\infty} \cap \text{vmo}) S^{m}_{cl} \quad \text{I (11.5)} \]
\[ M^{p}(\mathbb{R}^{n}) \quad \text{I (16.1)} \]
\[ M^{p,\omega}(\mathbb{R}^{n}) \quad \text{I (16.3)} \]
\[ \Phi^{m} S^{m}_{1,0} \quad \text{I (9.2)} \]
\[ R(f, u) \quad \text{I (3.48)} \]
\[ S^{m}_{1,0,\delta} \quad \text{I (0.9)} \]
\[ T_{f} \quad \text{I (3.46); II (0.18)} \]
\[ X S^{m}_{1,0} \quad \text{I (0.8), (2.44)} \]
\[ X S^{m}_{1,\kappa} \quad \text{I (2.52)} \]
\[ X S^{m}_{1,\kappa} \quad \text{I (3.18)} \]
