Preface	xv
Chapter 1. Vector spaces	1
§1.1. Preview	1
§1.2. The abstract definition of a vector space	2
§1.3. Some definitions	5
§1.4. Mappings	11
§1.5. Triangular matrices	13
§1.6. Block triangular matrices	16
§1.7. Schur complements	17
§1.8. Other matrix products	19
Chapter 2. Gaussian elimination	21
§2.1. Some preliminary observations	22
§2.2. Examples	24
§2.3. Upper echelon matrices	30
§2.4. The conservation of dimension	36
§2.5. Quotient spaces	38
§2.6. Conservation of dimension for matrices	38
§2.7. From U to A	40
§2.8. Square matrices	41
Chapter 3. Additional applications of Gaussian elimination	45
§3.1. Gaussian elimination redux	45

§3.2.	Properties of BA and AC	48
§3.3.	Extracting a basis	50
§3.4.	Computing the coefficients in a basis	51
§3.5.	The Gauss-Seidel method	52
§3.6.	Block Gaussian elimination	55
§3.7.	$\{0, 1, \infty\}$	56
§3.8.	Review	57
Chapter 4.	Eigenvalues and eigenvectors	61
§4.1.	Change of basis and similarity	62
§4.2.	Invariant subspaces	64
§4.3.	Existence of eigenvalues	64
§4.4.	Eigenvalues for matrices	66
§4.5.	Direct sums	69
§4.6.	Diagonalizable matrices	71
§4.7.	An algorithm for diagonalizing matrices	73
§4.8.	Computing eigenvalues at this point	74
§4.9.	Not all matrices are diagonalizable	76
§4.10.	The Jordan decomposition theorem	78
§4.11.	An instructive example	79
§4.12.	The binomial formula	82
§4.13.	More direct sum decompositions	82
§4.14.	Verification of Theorem 4.12	84
§4.15.	Bibliographical notes	87
Chapter 5.	Determinants	89
§5.1.	Functionals	89
§5.2.	Determinants	90
§5.3.	Useful rules for calculating determinants	93
§5.4.	Eigenvalues	97
§5.5.	Exploiting block structure	99
§5.6.	The Binet-Cauchy formula	102
§5.7.	Minors	104
§5.8.	Uses of determinants	108
§5.9.	Companion matrices	108
§5.10.	Circulants and Vandermonde matrices	109

Chapter 6. Calculating Jordan forms	111
§6.1. Overview	112
§6.2. Structure of the nullspaces \mathcal{N}_{B^j}	112
§6.3. Chains and cells	115
§6.4. Computing J	116
§6.5. An algorithm for U	117
§6.6. An example	120
§6.7. Another example	122
§6.8. Jordan decompositions for real matrices	126
§6.9. Companion and generalized Vandermonde matrices	128
Chapter 7. Normed linear spaces	133
§7.1. Four inequalities	133
§7.2. Normed linear spaces	138
§7.3. Equivalence of norms	140
§7.4. Norms of linear transformations	142
§7.5. Multiplicative norms	143
§7.6. Evaluating some operator norms	145
§7.7. Small perturbations	147
§7.8. Another estimate	149
§7.9. Bounded linear functionals	150
§7.10. Extensions of bounded linear functionals	152
§7.11. Banach spaces	155
Chapter 8. Inner product spaces and orthogonality	157
§8.1. Inner product spaces	157
§8.2. A characterization of inner product spaces	160
§8.3. Orthogonality	161
§8.4. Gram matrices	163
§8.5. Adjoints	163
§8.6. The Riesz representation theorem	166
§8.7. Normal, selfadjoint and unitary transformations	168
§8.8. Projections and direct sum decompositions	170
§8.9. Orthogonal projections	172
§8.10. Orthogonal expansions	174
§8.11. The Gram-Schmidt method	177

§8.12. Toeplitz and Hankel matrices	178
§8.13. Gaussian quadrature	180
§8.14. Bibliographical notes	183
Chapter 9. Symmetric, Hermitian and normal matrices	185
§9.1. Hermitian matrices are diagonalizable	186
§9.2. Commuting Hermitian matrices	188
§9.3. Real Hermitian matrices	190
§9.4. Projections and direct sums in \mathbb{F}^n	191
§9.5. Projections and rank	195
§9.6. Normal matrices	195
§9.7. Schur's theorem	198
§9.8. QR factorization	201
§9.9. Areas, volumes and determinants	202
§9.10. Bibliographical notes	206
Chapter 10. Singular values and related inequalities	207
§10.1. Singular value decompositions	207
§10.2. Complex symmetric matrices	212
§10.3. Approximate solutions of linear equations	213
§10.4. The Courant-Fischer theorem	215
§10.5. Inequalities for singular values	218
§10.6. Bibliographical notes	225
Chapter 11. Pseudoinverses	227
§11.1. Pseudoinverses	227
§11.2. The Moore-Penrose inverse	234
§11.3. Best approximation in terms of Moore-Penrose inverses	237
Chapter 12. Triangular factorization and positive definite matrices	239
§12.1. A detour on triangular factorization	240
§12.2. Definite and semidefinite matrices	242
§12.3. Characterizations of positive definite matrices	244
§12.4. An application of factorization	247
§12.5. Positive definite Toeplitz matrices	248
§12.6. Detour on block Toeplitz matrices	254
§12.7. A maximum entropy matrix completion problem	258
§12.8. Schur complements for semidefinite matrices	262

§12.9. Square roots	265
§12.10. Polar forms	267
§12.11. Matrix inequalities	268
§12.12. A minimal norm completion problem	271
§12.13. A description of all solutions to the minimal norm completion problem	273
§12.14. Bibliographical notes	274
Chapter 13. Difference equations and differential equations	275
§13.1. Systems of difference equations	276
§13.2. The exponential e^{tA}	277
§13.3. Systems of differential equations	279
§13.4. Uniqueness	281
§13.5. Isometric and isospectral flows	282
§13.6. Second-order differential systems	283
§13.7. Stability	284
§13.8. Nonhomogeneous differential systems	285
§13.9. Strategy for equations	285
§13.10. Second-order difference equations	286
§13.11. Higher order difference equations	289
§13.12. Ordinary differential equations	290
§13.13. Wronskians	293
§13.14. Variation of parameters	295
Chapter 14. Vector valued functions	297
§14.1. Mean value theorems	298
§14.2. Taylor's formula with remainder	299
§14.3. Application of Taylor's formula with remainder	300
§14.4. Mean value theorem for functions of several variables	301
§14.5. Mean value theorems for vector valued functions of several variables	301
§14.6. Newton's method	304
§14.7. A contractive fixed point theorem	306
§14.8. A refined contractive fixed point theorem	308
§14.9. Spectral radius	309
§14.10. The Brouwer fixed point theorem	313
§14.11. Bibliographical notes	316

Chapter 15. The implicit function theorem	317
§15.1. Preliminary discussion	317
§15.2. The main theorem	319
§15.3. A generalization of the implicit function theorem	324
§15.4. Continuous dependence of solutions	326
§15.5. The inverse function theorem	327
§15.6. Roots of polynomials	329
§15.7. An instructive example	329
§15.8. A more sophisticated approach	331
§15.9. Dynamical systems	333
§15.10. Lyapunov functions	335
§15.11. Bibliographical notes	336
Chapter 16. Extremal problems	337
§16.1. Classical extremal problems	337
§16.2. Extremal problems with constraints	341
§16.3. Examples	344
§16.4. Krylov subspaces	349
§16.5. The conjugate gradient method	349
§16.6. Dual extremal problems	354
§16.7. Bibliographical notes	356
Chapter 17. Matrix valued holomorphic functions	357
§17.1. Differentiation	357
§17.2. Contour integration	361
§17.3. Evaluating integrals by contour integration	365
§17.4. A short detour on Fourier analysis	370
§17.5. Contour integrals of matrix valued functions	372
§17.6. Continuous dependence of the eigenvalues	375
§17.7. More on small perturbations	377
§17.8. Spectral radius redux	378
§17.9. Fractional powers	381
Chapter 18. Matrix equations	383
§18.1. The equation $X - AXB = C$	383
§18.2. The Sylvester equation $AX - XB = C$	385
§18.3. Special classes of solutions	388

§18.4.	Riccati equations	390
§18.5.	Two lemmas	396
§18.6.	An LQR problem	398
§18.7.	Bibliographical notes	400
Chapter 19.	Realization theory	401
§19.1.	Minimal realizations	408
§19.2.	Stabilizable and detectable realizations	415
§19.3.	Reproducing kernel Hilbert spaces	416
§19.4.	de Branges spaces	418
§19.5.	R_α invariance	420
§19.6.	Factorization of $\Theta(\lambda)$	421
§19.7.	Bibliographical notes	425
Chapter 20.	Eigenvalue location problems	427
§20.1.	Interlacing	427
§20.2.	Sylvester's law of inertia	430
§20.3.	Congruence	431
§20.4.	Counting positive and negative eigenvalues	433
§20.5.	Exploiting continuity	437
§20.6.	Geršgorin disks	438
§20.7.	The spectral mapping principle	439
§20.8.	$AX = XB$	440
§20.9.	Inertia theorems	441
§20.10.	An eigenvalue assignment problem	443
§20.11.	Bibliographical notes	446
Chapter 21.	Zero location problems	447
§21.1.	Bezoutians	447
§21.2.	A derivation of the formula for H_f based on realization	452
§21.3.	The Barnett identity	453
§21.4.	The main theorem on Bezoutians	455
§21.5.	Resultants	457
§21.6.	Other directions	461
§21.7.	Bezoutians for real polynomials	463
§21.8.	Stable polynomials	464
§21.9.	Kharitonov's theorem	466

§21.10. Bibliographical notes	467
Chapter 22. Convexity	469
§22.1. Preliminaries	469
§22.2. Convex functions	471
§22.3. Convex sets in \mathbb{R}^n	473
§22.4. Separation theorems in \mathbb{R}^n	475
§22.5. Hyperplanes	477
§22.6. Support hyperplanes	479
§22.7. Convex hulls	480
§22.8. Extreme points	482
§22.9. Brouwer's theorem for compact convex sets	485
§22.10. The Minkowski functional	485
§22.11. The Gauss-Lucas theorem	488
§22.12. The numerical range	489
§22.13. Eigenvalues versus numerical range	491
§22.14. The Heinz inequality	492
§22.15. Bibliographical notes	494
Chapter 23. Matrices with nonnegative entries	495
§23.1. Perron-Frobenius theory	496
§23.2. Stochastic matrices	503
§23.3. Doubly stochastic matrices	504
§23.4. An inequality of Ky Fan	507
§23.5. The Schur-Horn convexity theorem	509
§23.6. Bibliographical notes	513
Appendix A. Some facts from analysis	515
§A.1. Convergence of sequences of points	515
§A.2. Convergence of sequences of functions	516
§A.3. Convergence of sums	516
§A.4. Sups and infs	517
§A.5. Topology	518
§A.6. Compact sets	518
§A.7. Normed linear spaces	518
Appendix B. More complex variables	521
§B.1. Power series	521

§B.2.	Isolated zeros	523
§B.3.	The maximum modulus principle	525
§B.4.	$\ln(1 - \lambda)$ when $ \lambda < 1$	525
§B.5.	Rouché's theorem	526
§B.6.	Liouville's theorem	528
§B.7.	Laurent expansions	528
§B.8.	Partial fraction expansions	529
