| Preface                                     | xiii |
| Introduction                                | xv   |
| Lecture 1. Basic Notions                    | 1    |
| §1. Algebraic sets                          | 1    |
| §2. Krull dimension of a ring               | 3    |
| §3. Dimension of an algebraic set           | 6    |
| §4. An extended example                     | 9    |
| §5. Tangent spaces and regular rings        | 10   |
| §6. Dimension of a module                   | 12   |
| Lecture 2. Cohomology                       | 15   |
| §1. Sheaves                                 | 16   |
| §2. Čech cohomology                         | 18   |
| §3. Calculus versus topology                | 23   |
| §4. Čech cohomology and derived functors    | 26   |
| Lecture 3. Resolutions and Derived Functors | 29   |
| §1. Free, projective, and flat modules      | 29   |
| §2. Complexes                               | 32   |
| §3. Resolutions                             | 34   |
| §4. Derived functors                        | 36   |
| Lecture 4. Limits                           | 41   |
| §1. An example from topology                | 41   |

---

|   |     |
|---|-----|
| §2. Direct limits   | 42  |
| §3. The category of diagrams                                | 44  |
| §4. Exactness   | 45  |
| §5. Diagrams over diagrams                                  | 48  |
| §6. Filtered posets   | 49  |
| §7. Diagrams over the pushout poset                         | 52  |
| §8. Inverse limits  | 53  |
| Lecture 5. Gradings, Filtrations, and Gröbner Bases         | 55  |
| §1. Filtrations and associated graded rings                 | 55  |
| §2. Hilbert polynomials                                     | 57  |
| §3. Monomial orders and initial forms                       | 59  |
| §4. Weight vectors and flat families                        | 61  |
| §5. Buchberger's algorithm                                  | 62  |
| §6. Gröbner bases and syzygies                              | 65  |
| Lecture 6. Complexes from a Sequence of Ring Elements       | 67  |
| §1. The Koszul complex                                      | 67  |
| §2. Regular sequences and depth: a first look               | 69  |
| §3. Back to the Koszul complex                              | 70  |
| §4. The Čech complex  | 73  |
| Lecture 7. Local Cohomology                                 | 77  |
| §1. The torsion functor                                     | 77  |
| §2. Direct limit of Ext modules                             | 80  |
| §3. Direct limit of Koszul cohomology                       | 81  |
| §4. Return of the Čech complex                              | 84  |
| Lecture 8. Auslander-Buchsbaum Formula and Global Dimension | 87  |
| §1. Regular sequences and depth redux                       | 87  |
| §2. Global dimension  | 89  |
| §3. Auslander-Buchsbaum formula                             | 91  |
| §4. Regular local rings                                     | 92  |
| §5. Complete local rings                                    | 96  |
| Lecture 9. Depth and Cohomological Dimension                | 97  |
| §1. Depth   | 97  |
| §2. Cohomological dimension                                 | 100 |

---

|  |     |
|--|-----|
| §3. Arithmetic rank                                      | 101 |
| Lecture 10. Cohen-Macaulay Rings                         | 105 |
| §1. Noether normalization                                | 106 |
| §2. Intersection multiplicities                          | 108 |
| §3. Invariant theory                                     | 110 |
| §4. Local cohomology                                     | 115 |
| Lecture 11. Gorenstein Rings                             | 117 |
| §1. Bass numbers   | 118 |
| §2. Recognizing Gorenstein rings                         | 120 |
| §3. Injective resolutions of Gorenstein rings            | 123 |
| §4. Local duality  | 123 |
| §5. Canonical modules                                    | 126 |
| Lecture 12. Connections with Sheaf Cohomology            | 131 |
| §1. Sheaf theory   | 131 |
| §2. Flasque sheaves                                      | 137 |
| §3. Local cohomology and sheaf cohomology                | 139 |
| Lecture 13. Projective Varieties                         | 141 |
| §1. Graded local cohomology                              | 141 |
| §2. Sheaves on projective varieties                      | 142 |
| §3. Global sections and cohomology                       | 144 |
| Lecture 14. The Hartshorne-Lichtenbaum Vanishing Theorem | 147 |
| Lecture 15. Connectedness                                | 153 |
| §1. Mayer-Vietoris sequence                              | 153 |
| §2. Punctured spectra                                    | 154 |
| Lecture 16. Polyhedral Applications                      | 159 |
| §1. Polytopes and faces                                  | 159 |
| §2. Upper bound theorem                                  | 161 |
| §3. The $h$ -vector of a simplicial complex              | 163 |
| §4. Stanley-Reisner rings                                | 164 |
| §5. Local cohomology of Stanley-Reisner rings            | 166 |
| §6. Proof of the upper bound theorem                     | 168 |
| Lecture 17. $D$ -modules                                 | 171 |

---

|   |     |
|---|-----|
| §1. Rings of differential operators                     | 171 |
| §2. The Weyl algebra                                    | 173 |
| §3. Holonomic modules                                   | 176 |
| §4. Gröbner bases                                       | 177 |
| Lecture 18. Local Duality Revisited                     | 179 |
| §1. Poincaré duality                                    | 179 |
| §2. Grothendieck duality                                | 180 |
| §3. Local duality                                       | 181 |
| §4. Global canonical modules                            | 183 |
| Lecture 19. De Rham Cohomology                          | 191 |
| §1. The real case: de Rham's theorem                    | 192 |
| §2. Complex manifolds                                   | 195 |
| §3. The algebraic case                                  | 198 |
| §4. Local and de Rham cohomology                        | 200 |
| Lecture 20. Local Cohomology over Semigroup Rings       | 203 |
| §1. Semigroup rings                                     | 203 |
| §2. Cones from semigroups                               | 205 |
| §3. Maximal support: the Ishida complex                 | 207 |
| §4. Monomial support: $\mathbb{Z}^d$ -graded injectives | 211 |
| §5. Hartshorne's example                                | 213 |
| Lecture 21. The Frobenius Endomorphism                  | 217 |
| §1. Homological properties                              | 217 |
| §2. Frobenius action on local cohomology modules        | 221 |
| §3. A vanishing theorem                                 | 225 |
| Lecture 22. Curious Examples                            | 229 |
| §1. Dependence on characteristic                        | 229 |
| §2. Associated primes of local cohomology modules       | 233 |
| Lecture 23. Algorithmic Aspects of Local Cohomology     | 239 |
| §1. Holonomicity of localization                        | 239 |
| §2. Local cohomology as a $D$ -module                   | 241 |
| §3. Bernstein-Sato polynomials                          | 242 |
| §4. Computing with the Frobenius morphism               | 246 |
| Lecture 24. Holonomic Rank and Hypergeometric Systems   | 247 |

---

|  |     |
|--|-----|
| §1. GKZ $A$ -hypergeometric systems            | 247 |
| §2. Rank vs. volume                            | 250 |
| §3. Euler-Koszul homology                      | 251 |
| §4. Holonomic families                         | 254 |
| Appendix. Injective Modules and Matlis Duality | 257 |
| §1. Essential extensions                       | 257 |
| §2. Noetherian rings                           | 260 |
| §3. Artinian rings                             | 263 |
| §4. Matlis duality                             | 265 |
| Bibliography                                   | 269 |
| Index  | 277 |
