Preface	ix
M. A. Lewis and J. Keener Introduction	1
James P. Keener Introduction to Dynamics of Biological Systems	7
1. Rates of reaction	9
2. Thresholds and bistability	14
3. Excitability	17
4. Summary	21
Bibliography	23
Mark A. Lewis, Thomas Hillen, and Frithjof Lutscher Spatial Dynamics in Ecology	25
1. Introduction	27
2. Deriving the model	28
2.1. Conservation law derivation	28
2.2. The Fokker-Planck equation	30
2.3. Fundamental solution to the diffusion equation	32
3. Population spread	34
4. Critical domain size problem	40
4.1. Classical problem	40
4.2. Critical domain size problem in a stream	42
Bibliography	45
J. M. Cushing Matrix Models and Population Dynamics	47
Introduction	49
Lecture 1. Matrix models	51
Lecture 2. Bifurcations	67
Lecture 3. Experimental case studies	81

Lecture 4. Periodically fluctuating environments	115
Lecture 5. Competitive interactions	135
Bibliography	147
David J. Earn	
Mathematical Epidemiology of Infectious Diseases	151
1. Introduction	153
2. Describing epidemics	154
2.1. Plague	154
2.2. Measles and other childhood diseases	155
2.3. Influenza	157
2.4. Statistical description of epidemic time series	157
2.5. Exercises	163
3. Modelling epidemics	163
3.1. Statistical modelling	163
3.2. Mechanistic modelling	166
3.3. Demographic stochasticity	170
3.4. Seasonal forcing	171
3.5. Exercises	174
4. Predicting epidemics	175
4.1. Exercises	181
5. Manipulating epidemics	182
6. Conclusions and take-home messages	183
Bibliography	183
Leon Glass	
Topological Approaches to Biological Dynamics	187
Lecture 1. Linear stability and the Poincaré–Hopf theorem applied to biology	191
Lecture 2. Discontinuous phase resetting	195
Lecture 3. Fixed points and the entrainment of biological oscillations	201
Lecture 4. Fixed points in phase maps with applications to development and spiral waves on spheres	205
Lecture 5. Unique stable limit cycles in model genetic networks	209
Lecture 6. Projects: Resetting and entraining biological oscillations	213
Bibliography	215

Helen Byrne	
Mathematical Modelling of Solid Tumour Growth: from Avascular to Vascular, via Angiogenesis	217
1. Introduction	219
2. Background biology	220
3. ODE models	222
3.1. Introduction	222
3.2. Growth of homogeneous solid tumours	223
3.3. Chemotherapy	224
3.4. Radiotherapy	229
3.5. Heterogeneous tumour growth	234
3.6. Discussion	236
3.7. Exercises	237
4. Avascular tumours: radially-symmetric growth	238
4.1. Introduction	238
4.2. Model development	239
4.3. Model analysis	242
4.4. Discussion	244
4.5. Exercises	245
5. Symmetry breaking and invasion	246
5.1. Introduction	246
5.2. The model equations	247
5.3. Radially-symmetric model solutions	248
5.4. Linear stability analysis	249
5.5. Discussion	251
5.6. Exercises	252
Appendix	253
6. Avascular tumours: multiphase models	254
6.1. Introduction	254
6.2. Model development	254
6.3. Model simplification	257
6.4. Discussion	259
7. Angiogenesis and vascular tumour growth	261
7.1. Introduction	261
7.2. Angiogenesis: model development	261
7.3. Angiogenesis: caricature model	262
7.4. Multiscale modelling of vascular tumour growth	265
7.5. Vascular tumour growth: numerical simulations and model predictions	269
7.6. Conclusions	270
7.7. Exercises	276
8. Summary and future directions	278
Bibliography	281

Paul C. Bressloff	
Lectures in Mathematical Neuroscience	289
Lecture 1. Single neuron models	293
1.1. Conductance-based models	293
1.2. Periodically forced neural oscillator	296
1.3. Integrate-and-fire models	303
Lecture 2. Synaptic and dendritic processing	315
2.1. Excitatory and inhibitory synapses	315
2.2. Kinetic model of a synapse	318
2.3. Dendritic filtering of synaptic inputs	322
2.4. Synaptic plasticity	325
Lecture 3. Firing rates, spike statistics and the neural code	337
3.1. The neural code	337
3.2. Spike statistics and the Poisson process	341
3.3. Stochastically driven IF neuron	344
3.4. Homogeneous population of IF neurons	348
Lecture 4. Network oscillations and synchrony	353
4.1. Phase reduction for synaptically coupled neural oscillators	354
4.2. Phase-locked solutions	357
4.3. Oscillations in large homogeneous networks	364
Lecture 5. Neural pattern formation	369
5.1. Reduction to rate models	369
5.2. Turing mechanism for cortical pattern formation	371
5.3. Persistent localized states	377
5.4. Traveling waves	383
Bibliography	391
