## PROJECTIONS OF THE PRIME-POWER ABELIAN GROUP OF ORDER $p^{m}$ AND TYPE $(m-1,1)$

ROSS A. BEAUMONT

1. Introduction. A function $f$ of the subgroups of the group $G$ upon the subgroups of the group $H$ is called a projectivity of $G$ upon $H(f(G)=H)$ if the following hold.
(1) For every subgroup $S$ of $G, f(S)$ is a subgroup of $H$.
(2) If $S^{\prime}$ is a subgroup of $H$, then there exists a subgroup $S$ of $G$ such that $f(S)=S^{\prime}$.
(3) If $S$ and $T$ are subgroups of $G, S \leqq T$ is a necessary and sufficient condition that $f(S) \leqq f(T)$.

The correspondence $f$ is a (1-1) correspondence which preserves the partial ordering of the set of subgroups of the group $G$.

Further, a projectivity $f$ is called index-preserving if $[T: S]$ $=[f(T): f(S)]$ for subgroups $S$ of cyclic subgroups $T$ of $G$; and $f$ is called strictly index-preserving if $[T: S]=[f(T): f(S)]$ for subgroups $S$ of subgroups $T$ of $G$.

If $G$ is the direct product of cyclic groups of order $p, p$ a prime number, R. Baer ${ }^{1}$ has given necessary and sufficient conditions that a group $H$ be a projection of $G$. In particular he has shown that if the projectivity of $G$ upon $H$ is index-preserving, then $G$ and $H$ are isomorphic. Thus in a study of the projections of the prime-power abelian group of order $p^{m}$ and type ( $m-1,1$ ), we need consider only the case $m>2$.

Rottlaender ${ }^{2}$ investigated the case $m=3$ and found necessary and sufficient conditions for the existence of a strictly index-preserving projectivity of the prime-power abelian group $G$ of order $p^{3}$ and type $(2,1)$ upon a group $H$.

In this note, Baer's general results are used to find the necessary and sufficient conditions for the existence of a projectivity of the prime-power abelian group $G$ of order $p^{m}$ and type ( $m-1,1$ ) upon a group $H$.
2. The necessary conditions. If $G$ is an abelian group of the type under consideration, $G=\left\{u_{1}\right\} \times\left\{u_{2}\right\}$ where $u_{1}$ is of order $p^{m-1}, m>2$,

[^0]and $u_{2}$ is of order $p$. If $f(G)=H$, it follows from known results ${ }^{3}$ that $f$ is index-preserving, and hence $H=\left\{f\left(\left\{u_{1}\right\}\right), f\left(\left\{u_{2}\right\}\right)\right\}$ where $f\left(\left\{u_{1}\right\}\right)$ $=\left\{u_{1}^{\prime}\right\}$ is a cyclic group of order $p^{m-1}, f\left(\left\{u_{2}\right\}\right)=\left\{u_{2}^{\prime}\right\}$ is a cyclic group of order $p$. Thus $H=\left\{u_{1}^{\prime}, u_{2}^{\prime}\right\}$ where $u_{1}^{\prime}$ and $u_{2}^{\prime}$ are independent generators of order $p^{m-1}$ and $p$, respectively.

If $K$ is any group, then $K^{p}$ is the set of all $p$ th powers of the elements of $K$, and $K^{p}$ is a characteristic subset of $K$.

Lemma 1. $f\left(G^{p}\right)=H^{p}$ is a characteristic subgroup of $H$.
Proof. $G^{p}=\left\{u_{1}^{p}\right\}$ and $f\left(G^{p}\right)=f\left(\left\{u_{1}^{p}\right\}\right)=f\left(\left\{u_{1}\right\}\right)^{p}=\left\{u_{1}^{p}\right\}$ since $f$ is index-preserving. $\left\{u_{1}^{p}\right\} \leqq H^{p}$. If $x$ is in $H^{p}, x=y^{p}$ where $y$ is in $H$. $f^{-1}(\{x\})=f^{-1}\left(\left\{y^{p}\right\}\right)=f^{-1}(\{y\})^{p}=\left\{u_{1}^{k} u_{2}^{n}\right\}^{p}=\left\{u_{1}^{k p}\right\} . f\left(\left\{u_{1}^{k p}\right\}\right)=f\left(\left\{u_{1}\right\}\right)^{k p}$ $=\left\{u_{1}^{\prime p}\right\}=\{x\}$. Hence $x=u_{1}^{\prime}{ }^{i k p}=\left(u_{1}^{\prime p}\right)^{i k}$ and $x$ is in $\left\{u_{1}^{\prime p}\right\}$. Thus $H^{p} \leqq\left\{u_{1}^{\prime p}\right\}$ so that we have shown that $f\left(G^{p}\right)=\left\{u_{1}^{\prime p}\right\}=H^{p}$. Since $H^{p}$ is a subgroup of $H$, it is a characteristic subgroup, and in particular normal.

Since $f(G)=H$ and $f\left(G^{p}\right)=H^{p}$, the index-preserving projectivity $f$ of $G$ upon $H$ induces an index-preserving projectivity of $G / G^{p}$ upon $H / H^{p} . G / G^{p}$ is the direct product of two cyclic groups of order $p$ and hence by the result ${ }^{4}$ mentioned above, $G / G^{p}$ and $H / H^{p}$ are isomorphic. Thus $H / H^{p}$ is abelian and $H^{p}$ contains the commutator subgroup of $H$. This implies

$$
\begin{equation*}
u_{2}^{\prime-1} u_{1}^{\prime} u_{2}^{\prime}=u_{1}^{\prime 1+j p} \tag{1}
\end{equation*}
$$

The following multiplication rules for elements in $H$ follow from (1)

$$
\begin{align*}
u_{2}^{\prime-1} u_{1}^{\prime h} u_{2}^{\prime} & =u_{1}^{\prime h(1+j p)},  \tag{2}\\
u_{1}^{\prime h} u_{2}^{\prime i} & =u_{2}^{\prime i} u_{1}^{\prime h(1+j p)^{i}},  \tag{3}\\
\left({\left.u_{2}^{\prime i} u_{1}^{\prime h}\right)^{k}}^{\prime \prime}\right. & =u_{2}^{\prime k i} u_{1}^{\prime h\left[1+(1+j p)^{i}+\cdots+(1+j p)^{(k-1) i]}\right.} \\
& =u_{2}^{\prime k i} u_{1}^{\prime h\left[(1+j p)^{k i}-1\right] /\left[(1+j p)^{i}-1\right]} . \tag{4}
\end{align*}
$$

It follows from (3) that the order of $H$ is $p^{m}$ so that we have proved the following theorem.

Theorem 1. If $G$ is the prime-power abelian group of order $p^{m}, m>2$, and type $(m-1,1)$ and if $f$ is a projectivity of $G$ upon a group $H$, then $H$ is a prime-power group of order $p^{m}$ generated by independent generators $u_{1}^{\prime}$ of order $p^{m-1}$ and $u_{2}^{\prime}$ of order $p$ such that $u_{2}^{\prime-1} u_{1}^{\prime} u_{2}^{\prime}=u_{1}^{\prime 1+j p}$.

If $p=2$, we derive the additional necessary condition.

[^1]Lemma 2. $j \equiv 0 \bmod 2$ so that $u_{2}^{\prime-1} u_{1}^{\prime} u_{2}^{\prime}=u_{1}^{\prime 1+4 w}$.
Proof. Since $f\left(\left\{u_{1}\right\}\right)=\left\{u_{1}^{\prime}\right\}$, it follows from Baer's results ${ }^{5}$ that there exists one and only one element $u^{\prime}$ in $H$ such that $f\left(\left\{u_{2}\right\}\right)=\left\{u^{\prime}\right\}$ and $f\left(\left\{u_{2} u_{1}\right\}\right)=\left\{u^{\prime} u_{1}^{\prime}\right\}$. Since $\left\{u^{\prime}\right\}=\left\{u_{2}^{\prime}\right\}, u^{\prime}=u_{2}^{\prime \rho}$ where $\rho$ is odd. $f\left(\left\{u_{2} u_{1}\right\}^{2}\right)=f\left(\left\{u_{2} u_{1}\right\}\right)^{2}$ since $f$ is index-preserving and we have

$$
\begin{aligned}
f\left(\left\{u_{2} u_{1}\right\}^{2}\right) & =f\left(\left\{u_{1}^{2}\right\}\right)=f\left(\left\{u_{1}\right\}\right)^{2}=\left\{u_{1}^{\prime 2}\right\}, \\
f\left(\left\{u_{2} u_{1}\right\}\right)^{2} & =\left\{\left(u^{\prime} u_{1}^{\prime}\right)^{2}\right\}=\left\{\left(u_{2}^{\prime \rho} u_{1}^{\prime}\right)^{2}\right\} \\
& =\left\{{u_{2}^{\prime 2 \rho} u_{1}^{\prime\left[(1+2 j)^{2 \rho-1] /\left[(1+2 j)^{\rho-1]}\right.}\right\}=\left\{u_{1}^{\prime(1+2) j^{\rho}+1}\right\} .}}^{\prime[ }\right\} .
\end{aligned}
$$

Thus $u_{1}^{\prime(1+2 j)^{\rho}+1}=u_{1}^{\prime 2 \gamma}$ where $\gamma$ is odd and we have

$$
\begin{aligned}
(1+2 j)^{\rho}+1 & \equiv 2 \gamma \bmod 2^{m-1} \\
2+2 \rho j+[\rho(\rho-1) / 2](2 j)^{2}+\cdots & \equiv 2 \gamma \bmod 2^{m-1} \\
1+\rho j+[\rho(\rho-1) / 2] 2 j^{2}+\cdots & \equiv \gamma \bmod 2^{m-2}
\end{aligned}
$$

and recall that $m>2$. Since $\gamma$ is odd, the left member of the congruence is odd which implies $\rho j$ is even. Since $\rho$ is odd, $j$ is even, which completes the proof of the lemma.
3. Construction of a projectivity for groups satisfying the necessary conditions. If $p$ is an odd prime and $H$ is a group satisfying the necessary conditions, then $H$ is either abelian or $H$ is the unique nonabelian group $\left\{U_{1}, U_{2}\right\}$ where $U_{1}$ and $U_{2}$ are subject to the sole defining relations ${ }^{6}$

$$
\begin{equation*}
U_{1}^{p^{m-1}}=U_{2}^{p}=1, \quad U_{2}^{-1} I T \cdot U_{2}=U_{1}^{1+p^{m-2}} \tag{5}
\end{equation*}
$$

If $H$ is abelian, then $G$ and $H$ are isomorphic and this isomorphism induces a projectivity of $G$ upon $H$.

If $H$ is non-abelian we will construct a projectivity of $G$ upon $H$ by establishing a correspondence between the cyclic subgroups and then extending this correspondence to a projectivity.

From (5) we find the following multiplication rule for elements of $H$

$$
\begin{equation*}
\left(U_{2}^{i} U_{1}^{h}\right)^{k}=U_{2}^{i k} U_{1}^{h\left[k+i k(k-1) p^{m-2} / 2\right]} \tag{6}
\end{equation*}
$$

Every element of $G$ has the unique form $u_{2}^{s} u_{1}^{r}$ where $0 \leqq s<p$, $0 \leqq r<p^{m-1}$. If $s>0$, there exists an integer $x$, uniquely determined

[^2]$\bmod p^{m-1}$, such that $s x \equiv 1 \bmod p^{m-1},(x, p)=1$. Then $u_{1}^{r}=\left(u_{1}^{r}\right)^{s x}=u_{1}^{r x}$ $=u_{1}^{t_{s}^{s}}$ where $r x=t$. $u_{2}^{s} u_{1}^{r}=u_{2}^{s} u_{1}^{t_{s}}$ and $\left\{u_{2}^{s} u_{1}^{r}\right\}=\left\{\left(u_{2} u_{1}^{t}\right)^{s}\right\}=\left\{u_{2} u_{1}^{t}\right\}$ where $t$ is uniquely determined $\bmod p^{m-1}$. We define the following correspondence of the cyclic subgroups of $G$ upon those of $H$
\[

$$
\begin{align*}
f\left(\left\{u_{2} u_{1}^{t}\right\}\right) & =\left\{U_{2} U_{1}^{t}\right\},  \tag{7}\\
f\left(\left\{u_{1}^{r}\right\}\right) & =\left\{U_{1}^{r}\right\} . \tag{8}
\end{align*}
$$
\]

The correspondence $f$ is a (1-1) correspondence of the set of cyclic subgroups of $G$ upon a subset of the set of cyclic subgroups of $H$. To show that $f$ is a (1-1) correspondence on the whole set of cyclic subgroups of $H$, it is only necessary to show that every cyclic subgroup of $H$ has the form $\left\{U_{2} U_{1}^{t}\right\}$ or $\left\{U_{1}^{r}\right\}$ where $t$ or $r$ is uniquely determined $\bmod p^{m-1}$, respectively.

Every element of $H$ has the unique form $U_{2}^{s} U_{1}^{r}$ where $0 \leqq s<p$, $0 \leqq r<p^{m-1}$. If $s>0$, there exists an integer $x$, uniquely determined $\bmod p^{m-1}$, such that $s x \equiv 1 \bmod p^{m-1},(x, p)=1$. Then

$$
\begin{aligned}
\left\{U_{2}^{s} U_{1}^{r}\right\} & =\left\{\left(U_{2}^{s} U_{1}^{r}\right)^{x}\right\} \\
& =\left\{U_{2}^{s x} U_{1}^{r\left[x+(s x(x-1) / 2) p^{m-2}\right]}\right\} \\
& =\left\{U_{2} U_{1}^{r\left[x+(s x(x-1) / 2) p^{m-2}\right]}\right\}
\end{aligned}
$$

where $r\left[x+(s x(x-1) / 2) p^{m-2}\right]$ is uniquely determined $\bmod p^{m-1}$.
The correspondence $f$ preserves the indices of the cyclic subgroups since

$$
f\left(\left\{u_{2} u_{1}^{t}\right\}^{p}\right)=f\left(\left\{u_{1}^{t p}\right\}\right)=\left\{U_{1}^{t p}\right\}
$$

by (8),

$$
f\left(\left\{u_{2} u_{1}^{t}\right\}\right)^{p}=\left\{U_{2} U_{1}^{t}\right\}^{p}=\left\{U_{1}^{t\left[p+(p(p-1) / 2) p^{m-2}\right]}\right\}=\left\{U_{1}^{t p}\right\}
$$

by (7) and (6).
Since the only non-cyclic subgroups of $H$ are those of the form $\left\{U_{1}^{p^{\lambda}}, U_{2}\right\}, 0 \leqq \lambda<m-1$, by extending $f$ so that

$$
\begin{equation*}
f\left(\left\{u_{1}^{p^{\lambda}}, u_{2}\right\}\right)=\left\{U_{1}^{p^{\lambda}}, U_{2}\right\} \tag{9}
\end{equation*}
$$

$f$ becomes an index-preserving projectivity of $G$ upon $H$.
Combining the above results with Theorem 1 we have this theorem.
Theorem 2. If $G$ is the prime-power abelian group of odd order $p^{m}$, $m>2$, and type $(m-1,1)$ then there exists a projectivity $f$ of $G$ upon a group $H$ if, and only if, either $H$ is isomorphic to $G$ or $H$ is the non-
abelian group $\left\{U_{1}, U_{2}\right\}$ where $U_{1}$ and $U_{2}$ are subject to the sole defining relations (5).

If $p=2$ it follows from Lemma 2 that if $m=3$, then $H$ is abelian and hence $G$ and $H$ are isomorphic groups. If $m>3$, it follows from Lemma 2 and from known results ${ }^{7}$ that $H$ is either abelian or the non-abelian group $\left\{U_{1}, U_{2}\right\}$ where $U_{1}$ and $U_{2}$ are subject to the sole defining relations

$$
\begin{equation*}
U_{1}^{2^{m-1}}=U_{2}^{2}=1, \quad U_{2} U_{1} U_{2}=U_{1}^{1+2^{m-2}} \tag{10}
\end{equation*}
$$

Since Baer has shown ${ }^{8}$ that there exists an index-preserving projectivity of $G$ upon this non-abelian group we have the following theorem.

Theorem 3. If $G$ is the prime-power abelian group of order $2^{m}, m>2$, and type $(m-1,1)$ then
(a) if $m=3$, there exists a projectivity $f$ of $G$ upon a group $H$ if and only if $G$ and $H$ are isomorphic groups;
(b) if $m>3$, there exists a projectivity $f$ of $G$ upon a group $H$ if, and only if, either $G$ and $H$ are isomorphic groups or $H$ is the non-abelian group $\left\{U_{1}, U_{2}\right\}$ where $U_{1}$ and $U_{2}$ are subject to the sole defining relations (10).
