Contents

Preface	ix
Nonclassical shocks and the Cauchy problem: General conservation laws PAOLO BAITI, PHILIPPE G. LEFLOCH AND BENEDETTO PICCOLI	1
The Harnack inequality and non-divergence equations LUIS A. CAFFARELLI	27
Vanishing viscosity limit for initial-boundary value problems for conservation laws GUI-QIANG CHEN AND HERMANO FRID	35
On the prediction of large-scale dynamics using unresolved computations ALEXANDRE J. CHORIN, ANTON P. KAST, AND RAZ KUPFERMAN	53
Variational bounds in turbulent convection PETER CONSTANTIN	77
On the solvability of implicit nonlinear systems in the vectorial case BERNARD DACOROGNA AND PAOLO MARCELLINI	89
Genuinely nonlinear hyperbolic systems of two conservation laws CONSTANTINE M. DAFERMOS	115
Milne problem for strong force scaling IRENE M. GAMBA	127
Simple front tracking JAMES GLIMM, JOHN W. GROVE, X. L. LI, AND N. ZHAO	133
Formation of singularities in relativistic fluid dynamics and in spherically symmetric plasma dynamics YAN GUO AND A. SHADI TAHVILDAR-ZADEH	151
Asymptotic stability of plane diffusion waves for the 2- D quasilinear wave equation CORRADO LATTANZIO AND PIERANGELO MARCATI	163
L_1 stability for systems of hyperbolic conservation laws TAI-PING LIU AND TONG YANG	183
The geometry of the stream lines of steady states of the Navier-Stokes equations TIAN MA AND SHOUHONG WANG	193
On complex-valued solutions to a 2- D eikonal equation, Part One: Qualitative properties ROLANDO MAGNANINI AND GIORGIO TALENTI	203

On diffusion-induced grain-boundary motion UWE F. MAYER AND GIERI SIMONETT	231
Local estimates for solutions to singular and degenerate quasilinear parabolic equations MIKE O'LEARY	241
The geometry of Wulff crystal shapes and its relations with Riemann problems DANPING PENG, STANLEY OSHER, BARRY MERRIMAN, AND HONG-KAI ZHAO	251

Preface

This volume is a collection of refereed original research papers and expository articles and stems from the scientific program of the 1997-98 Nonlinear PDE Emphasis Year at Northwestern University, which was jointly sponsored by Northwestern University and the National Science Foundation. Most of the papers presented are from the distinguished mathematicians who spoke at the International Conference on Nonlinear Partial Differential Equations, March 21-24, 1998, Evanston, IL.

The book is a cross-section of the most significant recent advances and current trends and directions in nonlinear partial differential equations and related topics. Contributions range from modern approaches to the classical theory in elliptic and parabolic equations to nonlinear hyperbolic systems of conservation laws and their numerical treatment.

The general guiding idea in editing this volume has been twofold. On one hand, we have solicited the papers that contribute in a substantial way to the general analytical treatment of the theory of nonlinear partial differential equations. On the other hand, we have attempted to collect the contributions to computational methods and applications, originating from significant realistic mathematical models of natural phenomena, to seek synergistic links between theory and modeling and computation and to underscore current research trends in partial differential equations. The borderline between these two aspects of mathematical research is rather fuzzy. We have also selected a set of papers that would bridge them.

Examples of the first kind of contributions include new insights into the role of the Harnack inequality in the theory of fully nonlinear elliptic equations, new results on the local behavior of degenerate parabolic equations, a treatment of the complex eikonal equations, and the solvability of implicit degenerate elliptic systems and motion by curvature.

Included in this broad category also are the papers establishing the regularity, large-time behavior, and L^1 stability of entropy solutions, the analysis of non-classical shocks, and the convergence of the vanishing viscosity method for initial-boundary value problems for nonlinear hyperbolic systems of conservation laws, as well as the asymptotic stability of diffusion waves for the multidimensional nonlinear wave equations and the structural stability of steady-state solutions of the Navier-Stokes equations.

Contributions of the second kind range from numerical methods for predicting the large-scale dynamics and multidimensional simple front tracking algorithms to mathematical aspects of turbulent convection, geometry of crystal shapes, singularities in relativity and plasma dynamics, and high field kinetic semiconductor models.

This volume would not have been possible without the help and support of a number of people and institutions. First, we would like to thank the American Mathematical Society, especially, Edward G. Dunne (Editor of Book Program), Christine M. Thivierge (Acquisitions Assistant), Deborah Smith (Production Editor), and the technical support group for their prompt and professional assistance and their patience with our slow pace.

Karen Townsend deserves our special thanks for her assistance in the review process.

We are also grateful to the referees for their constructive criticisms and suggestions, and to Konstantina Trivisa and Mikhail Feldman for their invaluable help with the editorial work.

Finally, we wish to acknowledge the financial support of the National Science Foundation through grant DMS-9708261 and Northwestern University, more specially, the Department of Mathematics and the Office of the Vice President for Research of Northwestern University.

The purchaser of this volume is entitled to the online version of this book by the AMS. To gain access, follow the instructions given on the form found in the back of this volume.
