1. Introduction

We consider the motion of the interface separating an inviscid, incompressible, irrotational fluid from a region of zero density in three-dimensional space; we assume that the fluid region is below the vacuum, the fluid is under the influence of gravity and the surface tension is zero. Assume that the density of mass of the fluid is one, the gravitational field is \((0, 0, -1)\), the free interface is \(\Sigma(t)\) at time \(t \geq 0\), and the fluid occupies the region \(\Omega(t)\). The motion of the fluid is described by

\[
\begin{align*}
  v_t + v \cdot \nabla v &= -(0, 0, 1) - \nabla p & \text{on } \Omega(t), \ t \geq 0 & \text{(Euler’s equation),} \\
  \text{div } v &= 0 & \text{on } \Omega(t), \ t \geq 0 & \text{(incompressible),} \\
  \text{curl } v &= 0, & \text{on } \Omega(t), \ t \geq 0 & \text{(irrotational),}
\end{align*}
\]

where \(v = (v_1, v_2, v_3)\) is the fluid velocity, \(p\) is the fluid pressure. Since we neglect the surface tension, the pressure is zero on the interface. So on the interface:

\[
\begin{align*}
  p &= 0, & \text{on } \Sigma(t), \\
  (1, v) &= \text{tangent to the free surface } (t, \Sigma(t)).
\end{align*}
\]

We want to find solutions of system (1.1)-(1.5), taking prescribed initial data, such that for every fixed \(t \geq 0\), \(\Sigma(t)\) approaches the \(xy\)-plane at infinity, and \(|v(x, y, z; t)| \to 0\), \(|v_3(x, y, z; t)| \to 0\), as \(|(x, y, z)| \to \infty\). Since the fluid is assumed irrotational, incompressible, we can reduce the study of the entire motion to the motion of the free surface.

The above model is a 3-D water wave model. It is generally known that when surface tension is neglected, the motion of the interface between an inviscid fluid and vacuum under the influence of gravity can be subject to Taylor instability [8], [22]. In a previous work [24], we studied the 2-dimensional water wave model; we showed that for a 2-D water wave, the sign condition relating to Taylor instability always holds for nonself-intersecting interface, that is, the motion of the interface is not subject to Taylor instability. We showed further that the 2-D full nonlinear water wave problem is uniquely solvable in Sobolev spaces, locally in time, for any initially nonself-intersecting interface. Earlier works on the well-posedness in Sobolev spaces of the 2-D water wave problem include Nalimov [18], Yosihara [25], and Walter Craig [6], where the main results concern the well-posedness of the
motion of free surface when it is a small perturbation of the still water. Shinbrot [19] and Kano and Nishida [12] obtained the local existence and uniqueness in time for both the 2-D and 3-D water wave problems with analytic data. T. Beale, T. Hou and Lowengrub [1] formulated the Taylor sign condition for an arbitrary solution and showed that when surface tension is neglected, the linearization of the 2-D full water wave equation about a presumed solution is well-posed provided the exact solution satisfies the Taylor sign condition. Recently, T. Hou, Z. Teng and P. Zhang [11] formulated the 3-D Taylor sign condition and extended the results in [1] to three-dimensional space. However a result on the well-posedness in Sobolev spaces of the full nonlinear 3-D water wave problem is still missing.

In this paper, we establish the well-posedness in Sobolev spaces of the full nonlinear 3-D water wave problem. We show that the results we obtained for the 2-D water wave also hold for 3-D, that is, the motion of the 3-D water wave is not subject to Taylor instability and the full 3-D water wave problem is well-posed in Sobolev spaces for any nonself-intersecting initial interface. The main difficulty is that in three-dimensional space, there is no such equivalence as the Riemann mapping, which we used in 2-D to “flatten out” the water wave and carry out the calculations; complex analysis does not apply to 3-D either. In this paper, we will show that Clifford analysis is an effective tool for the 3-D water wave problem, and we do not need Riemann Mapping to carry out the calculation and obtain well-posedness results.

The 3-D Taylor sign condition [11] is the following. Let $\xi = (x(\alpha, \beta, t), y(\alpha, \beta, t), z(\alpha, \beta, t))$, where $-\infty < \alpha, \beta < \infty$, be the parameterization of the interface $\Sigma(t)$ by Lagrangian coordinates $(\alpha, \beta)$, that is, $\xi_t(\alpha, \beta, t) = v(\xi(\alpha, \beta, t), t)$ is the velocity and $\xi_{tt}(\alpha, \beta, t)$ is the acceleration of the particle occupying the position $\xi(\alpha, \beta, t)$ at time $t$. Let $\mathbf{n}$ be the unit normal vector of the interface $\Sigma(t)$ pointing out of the water region. The sign condition requires that the quantity

$$ a = \xi_{tt} \cdot \mathbf{n} - (0, 0, -1) \cdot \mathbf{n} \geq c_0 > 0, $$

for some positive constant $c_0$ at each point on the interface. In order to understand our result on 2-D Taylor sign condition, Russ Caflisch and Tom Hou suggested the following physically more insightful approach. They pointed out that the quantity $a = \xi_{tt} \cdot \mathbf{n} - (0, 0, -1) \cdot \mathbf{n} = -\nabla p \cdot \mathbf{n}$, therefore $a > 0$ is somewhat equivalent to the fact that $p > 0$ inside the water region, and such a fact can be shown as long as the maximum principle applies. We find that indeed, the pressure $p$ is superharmonic in the water region $\Omega(t)$. We therefore are able to show that for the 3-D water wave, the quantity $a$ is also pointwisely greater than a positive constant depending only on the geometry of the interface, as long as the interface is nonself-intersecting. A detailed proof will be given in §4. This proof also applies to 2-D, it is physically more transparent than our original proof in [24]. The rest of the paper is devoted to showing that this fact implies well-posedness of the full nonlinear 3-D water wave problem. Clifford analysis is our main analysis tool. Using Clifford algebra, we can rewrite the system (1.1)-(1.5) into a system on the free surface, which can be easily reduced to a quasilinear system. The advantage of our new approach is that it works for all dimensions $n \geq 2$. This approach is however largely inspired by our previous work [24].
In the next section, we give a brief introduction to Clifford analysis; in §3, we introduce notations used in this paper and develop some identities; in §4, we formulate the system (1.1)-(1.5) into an equivalent system on the free surface and give a detailed proof for the fact that condition (1) always holds for non-self-intersecting free surfaces of 3-D water waves; in §5, we reduce the full water wave system into a quasilinear system and, at the end of this section, we specify the initial data of the original water wave system, and convert it into initial data for the quasilinear system; in §6, we show that the quasilinear system is well-posed in certain classes of Sobolev spaces; and in §7, we prove that the solution of the quasilinear system satisfies the original nonlinear water wave equations, provided the initial data satisfy the compatibility condition given at the end of §5. We then conclude the well-posedness result for the full nonlinear 3-D water wave problem.

§2. Clifford analysis

In this section, we review a few basic notions and facts about Clifford analysis and potential theory that will be used in this paper. We refer the reader to [2], [10] and [15] for more on the subject of Clifford analysis.

Clifford numbers. Let $V_n$ be an $n$-dimensional real linear vector space with basis

$$\{e_1, e_2, \ldots, e_n\}.$$ 

A Clifford algebra $C(V_n)$ is a unitary, associative algebra over the reals, generated by $V_n$, under the product rule:

$$e_j^2 = -1, \quad j = 1, 2, \ldots, n; \quad e_i e_j = -e_j e_i, \quad i \neq j.$$ 

An element $\sigma \in C(V_n)$ has a representation of the form

$$\sigma = \sum \sigma_I e_I, \quad \sigma_I \in \mathbb{R},$$

where the summation is over all ordered $j$-tuples $I = \{h_1, \ldots, h_j\}, \ 0 \leq j \leq n, \ 1 \leq h_1 < \cdots < h_j \leq n, \text{ and } e_I = e_{h_1} \ldots e_{h_j}$, with convention $e_0 = 1; \ \{\sigma_I\}$ are called components of $\sigma$; in particular, $\sigma_0$ is called the real part of $\sigma$ and is denoted by $\Re \sigma$. The length of $\sigma$ is $|\sigma| = (\sum \sigma_I^2)^{1/2}$. $C(V_2)$ is generally known as the algebra of quaternions. In the following, when we write $\sigma = \sum \sigma_I e_I$ or $\sigma = \sum \sigma_i e_i$, we always assume that $\sigma_I$ or $\sigma_i$ are real numbers. An element $\sigma = \sum \sigma_I e_I \in C(V_n)$ is called a $p$-vector if the summation is over ordered $p$-tuples $I$ only. The conjugate of a 1-vector $\xi = \sum^n_1 \xi_i e_i$ is defined as $\bar{\xi} = \sum^n_1 \xi_i \bar{e}_i$, where $\bar{e}_i = -e_i, \ i = 1, \ldots, n$. Given 1-vectors $\xi = \sum^n_1 \xi_i e_i$ and $\eta = \sum^n_1 \eta_i e_i$, their product $\xi \eta$ is the sum of the negative of their ‘inner product’ and ‘outer product’:

$$\xi \eta = -\xi \cdot \eta + \xi \wedge \eta,$$

where $\xi \cdot \eta = \sum^n_1 \xi_i \eta_i$ and $\xi \wedge \eta = \frac{1}{2}(\xi \eta - \eta \xi)$. The inner product $\xi \cdot \eta$ is a scalar, and the outer product $\xi \wedge \eta$ is a 2-vector. Notice that when $n = 3$, the components of $\xi \wedge \eta$ are the same as that of the cross product $\xi \times \eta$, when $\xi$ and $\eta$ are regarded as vectors in 3-space. We will identify the notations $\xi \wedge \eta$ and $\xi \times \eta$ in the following sections when we study 3-D water waves.
Clifford analyticity. We begin with some notations. Let $f$ be a function defined on $R^d$. We denote by $\partial^k f$ the $k$-th order partial derivative $\partial_{x_1} \cdots \partial_{x_d} f$, where $k = k_1 + \cdots + k_d$. We say $f \in C^j(R^d)$ if $f$ is $j$-times continuously differentiable, and all the $k$-th order derivatives $\partial^k f$, $k = 0, 1, \ldots, j$, satisfy $\sup_{x \in R^d} |\partial^k f(x)| < \infty$; if the function $f$ is $C(V_n)$-valued, we write $f \in C^j(R^d, C(V_n))$ or $f \in C^j(R^d)$. If $f$ is defined and continuous on a manifold $M$, we write $f \in C(M)$; we write $f \in C(M, C(V_n))$ or $f \in C(M)$ if $f$ is $C(V_n)$-valued. For $M \subset R^n$, we say $f \in C_0(M)$ if $f \in C(M)$ and $f$ is compactly supported.

Let $\Omega \subset R^n$ be a domain. We denote by $\overline{\Omega}$ the closure of $\Omega$, and by $\Omega^c$ the complement of $\Omega$. Assume $\Sigma$ is the boundary of $\Omega$. We say $\Omega$ is a Lipschitz domain with Lipschitz constant less than or equal to $M$, if

1. for each $\xi \in \Sigma$, there is a ball or a half-space $E \ni \xi$, a coordinate system $x' = (x_1, \ldots, x_{n-1}), x_n$, with origin at $\xi$, and a function $\phi : R^{n-1} \rightarrow R$ such that $\phi(0) = 0$,

$$|\phi(x') - \phi(y')| \leq M|x' - y'|,$$

and $\Omega \cap E = \{x = (x', x_n) : x_n > \phi(x')\} \cap E$;

2. $\Sigma$ can be covered by finitely many $E'$s from the above collection.

If for each $\xi \in \Sigma$, the function $\phi$ can be chosen in $C^j(R^{n-1})$, we say $\Omega$ is a $C^j$ domain. For a $C^j$ domain $\Omega$, $j \geq 1$, we say $f \in C^1(\Sigma)$ if $f$ is $1$-time continuously differentiable; we say $f \in C^1(\Omega)$ if $f \in C^1(\Sigma)$ and $f$ is compactly supported. Let $B_r(0)$ be the ball centered at the origin with radius $r$. For an unbounded domain $\Omega$, we say $\Sigma$ approaches plane $x_n = 0$ at infinity, if there is a sufficiently large $R$, such that outside $B_R(0)$, $\Sigma$ is a graph $(x', \phi(x'))$ and $\lim_{|x'| \rightarrow \infty} \phi(x') = 0$.

There are a few different but equivalent ways to define Clifford analyticity. We use the one given in [10].

Let $W$ be a domain in $R^n$, $D = \sum_1^n e_i \partial_{x_i}$, and $\overline{D} = \sum_1^n t_i \partial_{x_i}$. A function $f \in C(W, C(V_n))$ is said to be Clifford analytic on $W$ if $\nabla f = 0$ everywhere on $W$. Since $\overline{D}D = D\overline{D} = \Delta_n$, where $\Delta_n$ is the Laplacian, the real components of a Clifford analytic function are necessarily harmonic; on the other hand, if $\phi$ is a harmonic function on $W$, then $D\phi$ and $\overline{D}\phi (= -\overline{D}\phi)$ are Clifford analytic functions.

For a 1-vector-valued function $f = \sum_1^n f_i e_i$, we have $\nabla f = -\text{div} f + \text{curl} f$, so $f = \sum_1^n f_i e_i$ is Clifford analytic if and only if

$$\text{div} f = 0 \quad \text{and} \quad \text{curl} f = 0.$$  

It is clear that when $n = 2$, Clifford analyticity for 1-vector-valued functions is equivalent to complex (anti)analyticity.

Let $\Gamma_n$ be the fundamental solution for $\Delta$ in $R^n$:

$$\Gamma_2(\xi) = \frac{1}{2\pi} \log |\xi|, \quad \Gamma_n(\xi) = \frac{1}{\omega_n (2 - n)} |\xi|^{-(n-2)}, \quad n > 2,$$

where $\omega_n$ is the surface area of the unit sphere in $R^n$, and let

$$K(\xi) = 2\overline{D}\Gamma(\xi) = \frac{2}{\omega_n |\xi|^n}, \quad \xi \neq 0.$$  

Assume that $\Omega$ is a bounded $C^2$ domain in $W$ with boundary $\Sigma$. For each $\xi \in \Sigma$, let $n(\xi) = \sum_1^n n_i e_i$ be the unit outer normal to $\Sigma$, and let $dS$ be the surface measure of $\Sigma$. We have the following Cauchy Integral Theorem.
Theorem 2.1 (see [10, Chapter 2], (3.20)Corollary). If \( f \) is a Clifford analytic function on \( W \), then
\[
(2.6) \quad f(\eta) = \frac{1}{\omega_n} \int_{\Sigma} \frac{\xi - \eta}{|\xi - \eta|^n} n(\xi) f(\xi) \, dS(\xi),
\]
for each \( \eta \) in the interior of \( \Omega \).

Let \( f \) be a \( C(V_n) \)-valued function on \( \Sigma \). We introduce the Hilbert transform of \( f \) on \( \Sigma \):
\[
(2.7) \quad H^\Sigma f(\xi) = \frac{2}{\omega_n} \text{p.v.} \int_{\Sigma} \frac{\xi' - \xi}{|\xi' - \xi|^n} n(\xi') f(\xi') \, dS(\xi'), \quad \text{for} \quad \xi \in \Sigma,
\]
where \( \text{p.v.} f \) denotes the principal value of the integral.

Theorem 2.2 (see [10, Chapter 2], (7.1)Theorem). Assume that \( f \in C^1(\Sigma, C(V_n)) \). Then the Cauchy integral
\[
(2.8) \quad Cf(\eta) = \frac{1}{\omega_n} \int_{\Sigma} \frac{\xi - \eta}{|\xi - \eta|^n} n(\xi) f(\xi) \, dS(\xi), \quad \eta \in \Omega,
\]
is Clifford analytic on \( \Omega \), and continues on \( \Omega \). Moreover
\[
(2.9) \quad Cf(\xi) = \frac{1}{2} f(\xi) + \frac{1}{2} H^\Sigma f(\xi), \quad \text{for} \quad \xi \in \Sigma.
\]

Theorem 2.3 (see [10, Chapter 2], (7.21)Corollary). Assume that \( f \in C(\overline{\Sigma}, C(V_n)) \). \( f \) is Clifford analytic on \( \Omega \) if and only if
\[
(2.10) \quad f(\xi) = H^\Sigma f(\xi), \quad \text{for} \quad \xi \in \Sigma.
\]

Remark 1. For an unbounded \( C^2 \) domain \( \Omega \), Theorems 2.1, 2.2 and 2.3 hold under the further assumption that \( f \) decay at infinity.

Remark 2. Assume further that \( \Sigma \) approaches plane \( x_n = 0 \) at infinity. Then \( H^\Sigma 1 = \text{p.v.} \int_{\Sigma} K(\xi' - \xi)n(\xi') \, dS(\xi') = 0 \) for \( \xi \in \Sigma \). This is an easy consequence of (3.22) in [10, Chapter 2].

We introduce a few further notations and results. Assume \( \Omega \) is a \( C^2 \) domain in \( R^n \) with boundary \( \Sigma \) and outer unit normal \( n \). The so-called double layered potential operator \( K \) is defined for the scalar-valued function \( f \) on \( \Sigma \) by
\[
(2.11) \quad Kf(\xi) = \frac{2}{\omega_n} \text{p.v.} \int_{\Sigma} \frac{\xi' - \xi \cdot n(\xi')}{|\xi' - \xi|^n} f(\xi') \, dS(\xi'), \quad \text{for} \quad \xi \in \Sigma,
\]
and the single layered potential operator \( S \) is defined by
\[
(2.12) \quad Sf(\eta) = \frac{1}{\omega_n(2-n)} \int_{\Sigma} \frac{1}{|\eta - \xi|^n} f(\xi) \, dS(\xi), \quad \text{for} \quad \eta \in R^n.
\]
We know from a straightforward calculation that
\[
(2.13) \quad \overline{\partial}Sf = C(nf).
\]
Let \( L^2(\Sigma, dS) \) be the \( L^2 \) space on \( \Sigma \) with respect to surface measure \( dS \). We denote by \( K^* \) the adjoint of \( K \) in \( L^2(\Sigma, dS) \), that is,
\[
(2.14) \quad K^* f(\xi) = \frac{2}{\omega_n} \text{p.v.} \int_{\Sigma} \frac{(\xi' - \xi) \cdot n(\xi)}{|\xi' - \xi|^n} f(\xi') \, dS(\xi'), \quad \text{for} \quad \xi \in \Sigma.
\]
The following result is due to Verchota [23]; see also [13], [14].
**Theorem 2.4** ([23], [13], [14]). Assume that $\Omega$ and $\Omega^c$ are unbounded, connected Lipschitz domains, and $\Sigma$ approaches plane $x_n = 0$ at infinity. Then $I \pm K : L^2(\Sigma, dS) \to L^2(\Sigma, dS)$ and their adjoints $I \pm K^* : L^2(\Sigma, dS) \to L^2(\Sigma, dS)$ are invertible.

**Remark.** The invertibility result given by Verchota in [23] is for bounded Lipschitz domains, and by Kenig in [13, Theorem 2.1.5] is for bounded domains where the boundary is a single Lipschitz graph. Notice that the key elements in their proof are the Rellich identity [23, Lemma 2.2], [13, Lemma 2.1.8] and a continuity method [13, Lemma 2.1.7]. For the type of domain in Theorem 2.4, Rellich identity [23, Lemma 2.2] holds under the assumption that $u \in C^\infty(\Omega)$, $\Delta u = 0$ in $\Omega$, and $u(\eta) = O(|\eta|^{2-n})$, $\nabla u(\eta) = O(|\eta|^{-n})$ at $\infty$. Notice that for any $f \in C^0_0(\Sigma)$, $u = Sf$ satisfies these assumptions on both $\Omega$ and $\Omega^c$. The proof in [23], [13] can be modified to give Theorem 2.4.

The following results are consequences of Theorem 2.4 and Coifman-McIntosh-Meyer [4]. Let $\Omega$ be as in Theorem 2.4, and let $N(u)$ be a nontangential maximal function of $u$ on $\Omega$.

**Theorem 2.5** ([23], [13], [14]). Let $\Omega$ be as in Theorem 2.4. There is a unique solution $u$ of the Dirichlet problem

\begin{align*}
\Delta u &= 0 \quad \text{in } \Omega, \\
u &= f \in L^2(\Sigma, dS)
\end{align*}

such that $N(u) \in L^2(\Sigma, dS)$, where the boundary values are taken nontangentially a.e. Moreover, the solution $u$ has the form

\begin{equation}
(2.15) \quad u(\eta) = \frac{2}{\omega_n} \int_\Sigma \frac{(\xi - \eta) \cdot n(\xi)}{|\xi - \eta|^n} (I + K)^{-1} f(\xi) dS(\xi), \quad \eta \in \Omega.
\end{equation}

**Remark.** We can also solve the Dirichlet problem (D) by Kelvin transform (see [7, page 147]). That is, we first solve the Dirichlet problem on the bounded domain $\hat{\Omega}$

\begin{align*}
\Delta \hat{u} &= 0 \quad \text{in } \hat{\Omega}, \\
\hat{u} &= \hat{f} \quad \text{on } \partial \hat{\Omega},
\end{align*}

where $\hat{\Omega} = \{\eta : \frac{\eta}{|\eta|^2} \in \Omega\}$ (w.l.o.g. we assume $0 \notin \overline{\Omega}$) and $\hat{f}(\xi) = |\xi|^{2-n} f(\xi/|\xi|^2)$. We then take

\begin{equation}
(2.16) \quad u(\eta) = |\eta|^{2-n} \hat{u}(\eta/|\eta|^2), \quad \eta \in \Omega.
\end{equation}

The function $u$ in (2.16) is a solution of (D). Assume that $\Omega$ is a $C^2$ domain, and $\Sigma$ is given by the graph $(x', \phi(x'))$ outside a sufficiently large ball, with $\lim_{x' \to -\infty} \phi(x') = 0$, $\lim_{x' \to \infty} \nabla \phi(x')$, and $\lim_{x' \to \infty} \nabla \phi(x')$ exists and is finite. For $f \in C^0_0(\Sigma)$, a solution given by (2.16) clearly satisfies $u(\eta) = o(|\eta|^{2-n})$ and $\nabla u(\eta) = o(|\eta|^{-n})$, as $|\eta| \to \infty$. It is easy to check that the solution $u$ in (2.16) is the same as the one in (2.15) if $f \in C^0(\Sigma)$, and more generally, if $f \in C(\Sigma)$ and $f$ decay as fast as $o(|\eta|^{2-n})$ at infinity.
Theorem 2.6 ([23], [13], [14]). Let Ω be as in Theorem 2.4. There is a unique solution u of the Neumann problem
\[ \Delta u = 0 \quad \text{in } \Omega, \]
\[ \frac{\partial u}{\partial n} = f \in L^2(\Sigma, dS) \]
such that \( N(\nabla u) \in L^2(\Sigma, dS) \), where the boundary values are taken nontangentially a.e. Moreover, the solution u has the form
\[ u(\eta) = \frac{2}{\omega_n(n-2)} \int_{\Sigma} \frac{1}{|\xi - \eta|^{n-2}} (-I + \mathcal{K}^*)^{-1} f(\xi) \, dS(\xi), \quad \eta \in \Omega. \]

In the next section, we will introduce more notations and develop some identities.

§3. General notations and basic identities

We make further preparations in this section. Since we are only concerned with the 3-D water wave, we present this section in the 3-D context.

For the 3-D water wave, we use Clifford algebra \( \mathcal{C}(V_3) \). We regard points (vectors) \( \xi = (x, y, z) \in \mathbb{R}^3 \) and their corresponding Clifford 1-vectors \( \xi = xe_1 + ye_2 + ze_3 \) as equivalent, the same notation \( \xi \) can either be a point or its corresponding 1-vector in different contexts: for example, for vectors \( \xi \) and \( \eta \), the multiplication \( \xi \eta \) is obtained through Clifford multiplication by regarding \( \xi, \eta \) as their Clifford 1-vector counterparts; for Clifford 1-vectors \( \xi, \eta \) and \( \zeta \), \( \xi(\eta \times \zeta) \) is obtained by first regarding \( \eta \) and \( \zeta \) as vectors and calculating the cross product \( \eta \times \zeta \), then rewriting \( \eta \times \zeta \) as it’s corresponding Clifford 1-vector and calculating the Clifford multiplication between \( \xi \) and \( \eta \times \zeta \). This also applies to 1-vectors of operators such as \( D = \partial_x e_1 + \partial_y e_2 + \partial_z e_3 \), of which \( \nabla = (\partial_x, \partial_y, \partial_z) \) is the vector counterpart.

We give some additional notations of functional spaces. We use \( \mathcal{S}(\mathbb{R}^d) \) to indicate the Schwartz class of functions on \( \mathbb{R}^d \), i.e. those functions which are infinitely differentiable, and rapidly decay at infinity. \( \mathcal{S}'(\mathbb{R}^d) \) is the distribution space on \( \mathbb{R}^d \). \( L_p(\mathbb{R}^d) \) is the \( L_p \) space on \( \mathbb{R}^d \) with norm \( \|u\|_{L_p} = (\int |u(x)|^p \, dx)^{1/p} \). We use \( H^s(\mathbb{R}^d) \), \(-\infty < s < \infty \), to indicate Sobolev space which consists of \( u \in \mathcal{S}'(\mathbb{R}^d) \) such that \((1 + |\xi|^2)^s \hat{u}(\xi) \in L^2(\mathbb{R}^d)\), and the Sobolev norm of \( u \in H^s(\mathbb{R}^d) \) is
\[ \|u\|_s = \left( \int (1 + |\xi|^2)^2 |\hat{u}(\xi)|^2 \, d\xi \right)^{1/2}. \]

\( H^s(\mathbb{R}^d; \mathcal{C}(V_3)) \) is the space of \( \mathcal{C}(V_3) \)-valued \( u \) such that each component \( u_I \) of \( u \) is in \( H^s(\mathbb{R}^d) \); the norm of \( u \in H^s(\mathbb{R}^d; \mathcal{C}(V_3)) \) is given by \( \|u\|_s = \sum_I \|u_I\|_s^{(2)} \). We put \( \|u\| = \|u\|_0 \) for \( u \in H^0(\mathbb{R}^d) = L^2(\mathbb{R}^d) \) or \( u \in H^0(\mathbb{R}^d; \mathcal{C}(V_3)) \). For any function space \( \mathcal{A} \), we say \( u = u(\cdot, t) \in C^j([0, T], \mathcal{A}) \) if the mapping \( t \in [0, T] \rightarrow u(\cdot, t) \) is \( j \)-times continuously differentiable from \([0, T]\) to \( \mathcal{A} \), and we write \( u(t) = u(\cdot, t) \) for fixed \( t \). For \( f = f(\alpha, \beta, t) \), we use \( \partial_t f \) or \( f_t \) to denote the partial derivative w.r.t. \( t \), \( \partial_\alpha f \) or \( f_\alpha \) to denote the derivative w.r.t. \( \alpha \), and \( \partial_k^f \) to denote the \( k \)-th order partial derivative \( \partial_k^f \partial_\alpha^k f \), where \( k = k_1 + k_2 \). For operators \( A, B, [A, B] = AB - BA \) is the commutator. A pseudo-differential operator \( P(D) \) is defined by, for \( u \in \mathcal{S}(\mathbb{R}^d) \),
\[ P(D)u = (2\pi)^{-d} \int P(\xi)\hat{u}(\xi)e^{ix\xi} \, d\xi. \]

For each fixed \( t \in [0, T] \), assume \( \xi = \xi(\alpha, \beta, t) = x(\alpha, \beta, t)e_1 + y(\alpha, \beta, t)e_2 + z(\alpha, \beta, t)e_3 \), \(-\infty < \alpha, \beta < \infty \), describes a surface \( \Sigma(t) \), which divides space \( \mathbb{R}^3 \) into two unbounded, simply connected, lower and upper \( C^2 \) domains \( \Omega(t) \) and \( \Omega(t)^c \).
Assume further that \( \xi \in C^1([0, T], C^2(R^2, C(V_0))) \), \( \xi_\alpha \times \xi_\beta \not= 0 \) and \( n = \frac{\xi_\alpha \times \xi_\beta}{|\xi_\alpha \times \xi_\beta|} \) gives the outer unit normal of \( \Omega(t) \). We define the Hilbert transform on \( \Sigma(t) \) of \( f = f(\alpha, \beta, t) \) by

\[
H_{\Sigma(t)} f(\alpha, \beta, t) = H^{\Sigma(t)} F(\xi(\alpha, \beta, t), t),
\]

where \( F = F(\xi, t) \) is the function on \( \Sigma(t) \) such that \( f(\alpha, \beta, t) = F(\xi(\alpha, \beta, t), t) \). That is,

\[
(3.1) \quad H_{\Sigma(t)} f(\alpha, \beta, t) = H^{\Sigma(t)} F(\xi(\alpha, \beta, t), t) = \frac{2}{\omega_3} \text{p.v.} \int_{\Sigma(t)} \frac{\xi' - \xi(\alpha, \beta, t)}{|\xi' - \xi(\alpha, \beta, t)|^2} n(\xi') F(\xi', t) \, dS(\xi') = \text{p.v.} \int \int K(\xi'(\alpha', \beta', t) - \xi(\alpha, \beta, t)) \left( \xi_{\alpha'}' \times \xi_{\beta'}' \right) f(\alpha', \beta', t) \, d\alpha' d\beta'.
\]

In a brief form, we write (3.1) as

\[
H_{\Sigma(t)} f = \text{p.v.} \int \int K(\xi' - \xi) \left( \xi_{\alpha'}' \times \xi_{\beta'}' \right) f' \, d\alpha' d\beta',
\]

where \( \xi, \xi', \xi_{\alpha'}, \xi_{\beta'} \) and \( f' \) stand for \( \xi(\alpha, \beta, t), \xi(\alpha', \beta', t), \partial_{\alpha'} \xi(\alpha', \beta', t), \partial_{\beta'} \xi(\alpha', \beta', t) \) and \( f(\alpha', \beta', t) \) respectively. Similarly, \( \xi' \) and \( \xi \) will be used later as the brief forms of \( \partial_{\alpha} \xi(\alpha', \beta', t) \) and \( \partial_{\beta} \xi(\alpha, \beta, t) \). We define the single, double layered potentials \( S, K \) and the adjoint \( K^* \) on \( f = f(\alpha, \beta, t) \) similarly as \( S f = S F \circ \xi, K f = K F \circ \xi \) and \( K^* f = K^* F \circ \xi \). We have the following identities.

**Lemma 3.1.** Let \( f = f(\alpha, \beta, t) \in C([0, T], \mathcal{S}(R^2)) \). Then

\[
(3.2) \quad [\partial_1, H_{\Sigma(t)}] f = \text{p.v.} \int \int K(\xi' - \xi) \left( (\xi_\alpha - \xi_\alpha') \times (\xi_{\alpha'}' f_{\alpha'} - \xi_{\alpha'}' f_{\beta'}) \right) \, d\alpha' d\beta',
\]

and

\[
[\partial_\alpha, H_{\Sigma(t)}] f = \text{p.v.} \int \int K(\xi' - \xi) \left( (\xi_{\alpha'} - \xi_{\alpha'}') \times (\xi_{\beta'}' f_{\alpha'} - \xi_{\beta'}' f_{\beta'}) \right) \, d\alpha' d\beta',
\]

\[
(3.3) \quad [\partial_\beta, H_{\Sigma(t)}] f = \text{p.v.} \int \int K(\xi' - \xi) \left( (\xi_{\beta'} - \xi_{\beta'}') \times (\xi_{\alpha'}' f_{\alpha'}' - \xi_{\alpha'}' f_{\beta'}) \right) \, d\alpha' d\beta'.
\]

**Proof.** We prove (3.2) only. (3.3) can be obtained similarly.

We first calculate the quantity

\[
- (\eta \cdot \nabla) K (\xi_{\alpha'}' \times \xi_{\beta'}) + (\xi_{\alpha'}' \cdot \nabla) K (\eta \times \xi_{\beta'}) + (\xi_{\beta'}' \cdot \nabla) K (\xi_{\alpha'}' \times \eta),
\]

where \( \eta \) is a (Clifford 1)-vector. Assume \( K = K_1 e_1 + K_2 e_2 + K_3 e_3 \), where \( K_i, i = 1, 2, 3 \), are components of \( K \). For \( i = 1, 2, 3 \), we have, in vector form, that

\[
- (\eta \cdot \nabla K_i)(\xi_{\alpha'}' \times \xi_{\beta'}) + (\xi_{\alpha'}' \cdot \nabla K_i) \eta \times \xi_{\beta'} + (\xi_{\beta'}' \cdot \nabla K_i) \xi_{\alpha'} \times \eta
\]

\[
= - (\eta \cdot \nabla K_i)(\xi_{\alpha'}' \times \xi_{\beta'}) + \eta \times ( (\xi_{\alpha'}' \cdot \nabla K_i) \xi_{\beta'} - (\xi_{\beta'}' \cdot \nabla K_i) \xi_{\alpha'} )
\]

\[
= - (\eta \cdot \nabla K_i)(\xi_{\alpha'}' \times \xi_{\beta'}) + \eta \times ( (\xi_{\alpha'}' \times \xi_{\beta'}) \times \nabla K_i
\]

\[
= - (\eta \cdot (\xi_{\alpha'}' \times \xi_{\beta'}')) \nabla K_i.
\]
The Clifford algebra version of (3.4) is

\[-(\eta \cdot \nabla K_i)\xi'_{\alpha'} \times \xi'_{\beta'} + (\xi'_{\alpha'} \cdot \nabla K_i) \eta \times \xi'_{\beta'} + (\xi'_{\beta'} \cdot \nabla K_i) \xi'_{\alpha'} \times \eta\]

\[= -(\eta \cdot (\xi'_{\alpha'} \times \xi'_{\beta'}))DK_i.\]

Since $K = \overline{D} \Gamma$, where $\Gamma$ is the fundamental solution for Laplacian $\Delta$, we have $\sum_1^3 e_iDK_i(\xi) = 0$ for $\xi \neq 0$. Therefore

\[\begin{align*}
- (\eta \cdot \nabla K(\xi)) (\xi'_{\alpha'} \times \xi'_{\beta'}) + (\xi'_{\alpha'} \cdot \nabla K(\xi)) (\eta \times \xi'_{\beta'}) + (\xi'_{\beta'} \cdot \nabla K(\xi)) (\xi'_{\alpha'} \times \eta) \\
= \sum_1^3 e_i\left\{-(\eta \cdot \nabla K_i(\xi)) (\xi'_{\alpha'} \times \xi'_{\beta'}) + (\xi'_{\alpha'} \cdot \nabla K_i(\xi)) (\eta \times \xi'_{\beta'})ight\}
\end{align*}\]

\[(3.5)\]

\[\begin{align*}
= -(\eta \cdot (\xi'_{\alpha'} \times \xi'_{\beta'})) \sum_1^3 e_iDK_i(\xi) = 0, \quad \text{for } \xi \neq 0.
\end{align*}\]

Now let’s prove (3.2). By definition, we have

\[(3.6)\]

\[\begin{align*}
[\partial_t, H_{\Sigma(t)}]f &= \partial_t(H_{\Sigma(t)}f) - H_{\Sigma(t)}(\partial_t f) \\
&= \text{p.v.} \int \partial_t(K(\xi' - \xi)) (\xi'_{\alpha'} \times \xi'_{\beta'})(f' - f(\alpha, \beta, t)) d\alpha' d\beta' \\
&= \text{p.v.} \int \partial_t(K(\xi' - \xi)) (\xi'_{\alpha'} \times \xi'_{\beta'})(f' - f(\alpha, \beta, t)) d\alpha' d\beta' \\
&\quad + \text{p.v.} \int K(\xi' - \xi)(\xi'_{\alpha'} \times \xi'_{\beta'} + \xi'_{\alpha'} \times \xi'_{\beta'})(f' - f(\alpha, \beta, t)) d\alpha' d\beta'.
\end{align*}\]

Notice that

\[\partial_t(K(\xi' - \xi)) = (((\xi'_{\alpha'} - \xi_t) \cdot \nabla) K(\xi' - \xi), \quad \partial_{\alpha'} K(\xi' - \xi) = (\xi'_{\alpha'} \cdot \nabla) K(\xi' - \xi)\]

and

\[\partial_{\beta'} K(\xi' - \xi) = (\xi'_{\beta'} \cdot \nabla) K(\xi' - \xi).\]

In (3.5) we take $\eta = \xi'_{\alpha'} - \xi_t$ and apply to (3.6). We get

\[(3.7)\]

\[\begin{align*}
[\partial_t, H_{\Sigma(t)}]f &= \text{p.v.} \int \left\{\partial_{\alpha'} K((\xi'_{\alpha'} - \xi_t) \times \xi'_{\beta'}) \\
&\quad + \partial_{\beta'} K((\xi'_{\alpha'} - \xi_t) \times (\xi'_{\beta'} - \xi_t))\right\}(f' - f) d\alpha' d\beta' \\
&\quad + \text{p.v.} \int K(\xi' - \xi)(\xi'_{\alpha'} \times \xi'_{\beta'} + \xi'_{\alpha'} \times \xi'_{\beta'})(f' - f(\alpha, \beta, t)) d\alpha' d\beta'.
\end{align*}\]
Applying integration by parts to the first term on the right hand side of (3.7), we obtain

\[(3.8)\]

\[
\langle \partial_t, H_{\Sigma(t)} \rangle f = - \text{p.v.} \int K(\xi' - \xi) \left( (\xi'_\alpha - \xi_\alpha) \times (\xi'\beta + \xi_\beta) + (\xi'_\alpha - \xi_\alpha) f' \right) \, d\alpha' d\beta'
\]

\[
- \text{p.v.} \int K(\xi' - \xi) \left( (\xi'_\alpha - \xi_\alpha) \times (\xi'\beta + \xi_\beta) \right) (f' - f(\alpha, \beta, t)) \, d\alpha' d\beta'
\]

\[
+ \text{p.v.} \int K(\xi' - \xi) \left( (\xi'_\alpha - \xi_\alpha) \times (\xi'\beta + \xi_\beta) \right) (f' - f(\alpha, \beta, t)) \, d\alpha' d\beta'
\]

\[
= \text{p.v.} \int K(\xi' - \xi) \left( (\xi'_i - \xi_i) \times (\xi'_{i'} - \xi_{i'}) f_{i'} \right) \, d\alpha' d\beta'.
\]

This gives (3.2).

Let \( f = f(\alpha, \beta, t) \) be a scalar-valued function in \( C([0, T], \mathfrak{S}(R^2)) \), and let

\( F(\xi(\alpha, \beta, t), t) = f(\alpha, \beta, t) \). Let \( f^h = f^h(\eta, t) \), \( \eta \in \Omega(t) \), be the harmonic extension of \( F = F(\xi, t) \) on \( \Omega(t) \) given by Theorem 2.5. We denote by \( \nabla_\xi f \) the restriction of \( \nabla f^h \) on \( \Sigma(t) \); that is,

\[(3.9)\]

\[
\nabla_\xi f(\alpha, \beta, t) = \nabla f^h(\xi(\alpha, \beta, t), t),
\]

and similarly \( \mathcal{D}_\xi f(\alpha, \beta, t) = \mathcal{D} f^h(\xi(\alpha, \beta, t), t) \), \( \partial_\alpha f(\alpha, \beta, t) = \partial_\alpha f^h(\xi(\alpha, \beta, t), t) \), etc. We call \( \nabla_\xi f \) the space variable gradient of \( f \), to distinguish from the usual gradient \( \nabla f = (f_\alpha, f_\beta) \). We define the normal derivative of \( f \) by

\[(3.10)\]

\[
\nabla_n f(\alpha, \beta, t) = \nabla_\xi f(\alpha, \beta, t) = \frac{\partial f^h}{\partial n}(\xi(\alpha, \beta, t), t)
\]

and we denote by \( \nabla_T f \) the quantity

\[(3.11)\]

\[
\nabla_T f(\alpha, \beta, t) = \nabla_\xi f(\alpha, \beta, t) \times \nabla f(\alpha, \beta, t).
\]

\( \nabla_n f \) is generally known as the Dirichlet-Neumann operator. We get by definition that

\[
\nabla_\xi f = -\nabla f(\xi) \cdot \nabla_\xi f = -\nabla f(\xi)(-\nabla f(\xi) \cdot \nabla_\xi f + \nabla_\xi f) = \nabla f(\xi) \nabla_n f - \nabla f(\xi) \nabla_T f,
\]

and

\[
\nabla_T f = \nabla_\xi f \times \nabla_\xi f = \frac{1}{|\xi_\alpha \times \xi_\beta|} (\xi_\alpha \times \xi_\beta) \times \nabla_\xi f
\]

\[
= \frac{1}{|\xi_\alpha \times \xi_\beta|} (\xi_\beta (\xi_\alpha \cdot \nabla f^h(\xi)) - \xi_\alpha (\xi_\beta \cdot \nabla f^h(\xi)))
\]

\[
= \frac{1}{|\xi_\alpha \times \xi_\beta|} (\xi_\beta \partial_\alpha f - \xi_\alpha \partial_\beta f) = T_1 \partial_\alpha f - T_2 \partial_\beta f,
\]

where \( T_1 = \frac{1}{|\xi_\alpha \times \xi_\beta|} \xi_\beta, \quad T_2 = \frac{1}{|\xi_\alpha \times \xi_\beta|} \xi_\alpha. \)

Since \( f^h \) is harmonic on \( \Omega \), \( \mathcal{D} f^h \) is Clifford analytic. So by Theorem 2.3, \( \mathcal{D}_\xi f = H_{\Sigma(t)} \mathcal{D}_\xi f \), consequently

\[
\nabla f(\xi) \mathcal{D}_\xi f = \nabla f(\xi) H_{\Sigma(t)} \mathcal{D}_\xi f = \nabla f(\xi) \text{p.v.} \int K(\xi' - \xi) (\xi'_\alpha \times \xi'_{i'}) \mathcal{D}_\xi f' \, d\alpha' d\beta'.
\]
and

\[ \nabla_n f = -\Re(n(\xi) D_\xi f) \]

\[ = -\text{p.v.} \int \left( n(\xi) \cdot K(\xi' - \xi) \left( (\xi'_{\alpha'} \times \xi'_{\beta'}) \cdot \nabla f' \right) \right) d\alpha' d\beta' \]

\[ + \text{p.v.} \int \left( n(\xi) \times K(\xi' - \xi) \cdot (\xi'_{\alpha'} \times \xi'_{\beta'}) \times \nabla f' \right) d\alpha' d\beta' \]

\[ = -K^*(\nabla_n f) + \text{p.v.} \int \left( n(\xi) \times K(\xi' - \xi) \cdot (\xi'_{\alpha'} \partial_{\alpha'} f' - \xi'_{\beta'} \partial_{\beta'} f') \right) d\alpha' d\beta', \]

therefore

\[ (I + K^*)(\nabla_n f) = \text{p.v.} \int \left( n(\xi) \times K(\xi' - \xi) \cdot (\xi'_{\alpha'} \partial_{\alpha'} f' - \xi'_{\beta'} \partial_{\beta'} f') \right) d\alpha' d\beta'. \]

On the other hand, we know from Theorem 2.6 that \( f^h = 2S(-I + K^*)^{-1}\nabla_n f \), so from (2.13) and Theorem 2.2, \( D f^h = -2C(n(-I + K^*)^{-1}\nabla_n f) \) is continuous on \( \Omega(t) \) and

\[ D_\xi f = -(I + H_{\Sigma(t)})(n(-I + K^*)^{-1}\nabla_n f). \]

We introduce one more notation in this section. We define

\[ H^*_2 = nH_{\Sigma} n. \]

A simple calculation shows that for a real scalar-valued function \( f \), \( \Re(H^*_2 f) = K^* f \).

We calculate the commutators \([\partial_\alpha, \nabla_n], [\partial_\alpha, \nabla_n] \) and \([\partial_\beta, \nabla_n] \) in the following lemma.

**Lemma 3.2.** For \( f \in C([0, T], \mathcal{S}(R^2)) \), we have

\[ (I + K^*)([\partial_\alpha, \nabla_n] f) \]

\[ = \Re \left( -n_{\alpha} H_{\Sigma(t)}(D_\xi f) - n[\partial_\alpha, H_{\Sigma(t)}](D_\xi f) + nH_{\Sigma(t)}(n\nabla_\xi f) \right) \]

\[ + \int_{\Sigma(t)} n(\xi) \times K(\xi' - \xi) \cdot \left( \partial_{\alpha'} \left( \frac{1}{|\xi'_{\alpha'} \times \xi'_{\beta'}|} \xi_{\alpha'} \right) f_{\alpha'} - \partial_{\beta'} \left( \frac{1}{|\xi'_{\alpha'} \times \xi'_{\beta'}|} \xi_{\alpha'} \right) f_{\beta'} \right) dS(\xi') \]

and

\[ (I + K^*)([\partial_\beta, \nabla_n] f) \]

\[ = \Re \left( -n_{\alpha} H_{\Sigma(t)}(D_\xi f) - n[\partial_\alpha, H_{\Sigma(t)}](D_\xi f) + nH_{\Sigma(t)}(n\nabla_\xi f) \right) \]

\[ + \int_{\Sigma(t)} n(\xi) \times K(\xi' - \xi) \cdot \left( \partial_{\alpha'} \left( \frac{1}{|\xi'_{\alpha'} \times \xi'_{\beta'}|} \xi_{\alpha'} \right) f_{\alpha'} - \partial_{\beta'} \left( \frac{1}{|\xi'_{\alpha'} \times \xi'_{\beta'}|} \xi_{\alpha'} \right) f_{\beta'} \right) dS(\xi'), \]

where \( n_{\alpha} \) and \( n_{\alpha} \) are partial derivatives of \( n \) w.r.t. \( t \) and \( \alpha \) respectively. A similar identity also holds for \([\partial_\beta, \nabla_n] f \).

**Proof.** We only derive (3.16). (3.17) can be proved similarly.

By definition, we have that

\[ nD_\xi f = nH_{\Sigma(t)}(D_\xi f) = -H^*_2(\nabla_\xi f) \quad \text{and} \]

\[ nD_\xi f_t = nH_{\Sigma(t)}(D_\xi f_t) = -H^*_2(nD_\xi f_t). \]
Therefore
\begin{equation}
(3.18) \quad \partial_t(\mathbf{n}D_tf) - \mathbf{n}D_tf_t = -\partial_t \left( H_{\Sigma(t)}^*(\mathbf{n}D_tf) \right) + H_{\Sigma(t)}^*(\mathbf{n}D_tf_t)
= -[\partial_t, H_{\Sigma(t)}^*(\mathbf{n}D_tf) - H_{\Sigma(t)}^*(\partial_t(\mathbf{n}D_tf) - \mathbf{n}D_tf_t)].
\end{equation}

We know
\begin{equation}
(3.19) \quad \partial_t(\mathbf{n}D_tf) - \mathbf{n}D_tf_t
= -\partial_t(\mathbf{n} \cdot D_tf) - \mathbf{n} \cdot D_tf_t + \partial_t(\mathbf{n} \times D_tf) - \mathbf{n} \times D_tf_t
= -\partial_t(\nabla \mathbf{n}f - (\nabla \mathbf{n}f_t))
+ \partial_t(\frac{1}{|\xi_\alpha \times \xi_\beta|} (\xi_\beta f_\alpha - \xi_\alpha f_\beta)) - \frac{1}{|\xi_\alpha \times \xi_\beta|} (\xi_\beta f_\alpha - \xi_\alpha f_\beta)
\tag{3.12}
\end{equation}

by (3.12)

and
\begin{equation}
(3.20) \quad [\partial_t, H_{\Sigma(t)}^*] = \mathbf{n}_t H_{\Sigma(t)}^* \mathbf{n} + \mathbf{n}[\partial_t, H_{\Sigma(t)}^*] \mathbf{n} + \mathbf{n} H_{\Sigma(t)}^* \mathbf{n}_t.
\end{equation}

Taking real parts in both sides of (3.18), we get
\[-[\partial_t, \nabla \mathbf{n}]f = -\Re([\partial_t, H_{\Sigma(t)}^*(\mathbf{n}D_tf)] + K^*([\partial_t, \nabla \mathbf{n}]f)
- \int_{\Sigma(t)} \mathbf{n}(\xi) \times \mathbf{K}(\xi' - \xi) \cdot (\partial_t(\frac{1}{|\xi'_\alpha' \times \xi'_\beta'|} \xi'_\beta') f_{\alpha'} - \partial_t(\frac{1}{|\xi'_\alpha' \times \xi'_\beta'|} \xi'_\alpha') f_{\beta'}) dS(\xi').
\]

Therefore
\begin{equation}
(3.21) \quad (I + K^*)(\partial_t, \nabla \mathbf{n}]f)
= \Re \left( -\mathbf{n}_t H_{\Sigma(t)}^*(D_tf) - \mathbf{n}[\partial_t, H_{\Sigma(t)}^*(D_tf)] + \mathbf{n} H_{\Sigma(t)}^*(\mathbf{n}_t \mathbf{n}D_tf) \right)
+ \int_{\Sigma(t)} \mathbf{n}(\xi) \times \mathbf{K}(\xi' - \xi) \cdot (\partial_t(\frac{1}{|\xi'_\alpha' \times \xi'_\beta'|} \xi'_\beta') f_{\alpha'} - \partial_t(\frac{1}{|\xi'_\alpha' \times \xi'_\beta'|} \xi'_\alpha') f_{\beta'}) dS(\xi').
\end{equation}

This proves (3.16). \qed

§4. THE EQUATION OF FREE SURFACES AND A KEY LEMMA

We are now ready to study system (1.1)-(1.5). We plan to take a similar approach as the 2-D water wave (see [24], also [6], [18], [25]), that is, we first convert (1.1)-(1.5) into a system on the free surfaces. We then reduce this system to a quasilinear system and solve the quasilinear system, and show that the solution of the quasilinear system is also a solution of the system on the interface.

In this section, we convert system (1.1)-(1.5) into a system on the free surfaces and show that the sign condition (1) always hold for the nonself-intersecting 3-D water wave. As we will see, the sign condition (1) is the key that guarantees well-posedness of the quasilinear system in Sobolev spaces.

At time \( t \), let \( \Omega(t) \) be the water region and let \( \Sigma(t) \) be the interface. Suppose \( \Sigma(t) \) is described by \( \xi(\alpha, \beta, t) = x(\alpha, \beta, t)e_1 + y(\alpha, \beta, t)e_2 + z(\alpha, \beta, t)e_3 \), \(-\infty < \alpha, \beta < \infty \), where \( (\alpha, \beta) \) is the Lagrangian coordinates, i.e.
\begin{equation}
(4.1) \quad \xi_t(\alpha, \beta, t) = v(\xi(\alpha, \beta, t), t),
\end{equation}
and suppose the unit normal $n = \frac{\xi_\alpha \times \xi_\beta}{|\xi_\alpha \times \xi_\beta|}$ points out of $\Omega(t)$. From (1.1), we have on the interface, $\xi_{tt} = v_t + v \cdot \nabla v = - (0, 0, 1) - \nabla p$. On the other hand, (1.4) implies that $\nabla p$ is parallel to $n$. Therefore, $\xi_{tt} + e_3 = - \nabla p = a n$ (each term in this equation is regarded as a Clifford 1-vector), where

$$a = (\xi_{tt} + e_3) \cdot n = - \nabla p \cdot n = - \frac{\partial p}{\partial n}.$$  

From (1.2), (1.3), we know that the $C(V_3)$-valued velocity $v(\xi, t) = v_1(\xi, t) e_1 + v_2(\xi, t) e_2 + v_3(\xi, t) e_3$ is Clifford analytic on $\Omega(t)$, so it’s value on $\Sigma(t)$: $v(\xi(\alpha, \beta, t), t) = \xi(\alpha, \beta, t)$ satisfies (2.10). The initial value problem for system (1.1)-(1.5) is then reduced to the following problem:

$$\xi_{tt} + e_3 = a n,$$

(3)

$$\xi_t = H_{\Sigma(t)} \xi_t,$$

(4)

$$\xi(\alpha, \beta, 0) = \xi_0(\alpha, \beta), \quad \xi_t(\alpha, \beta, 0) = \xi_1(\alpha, \beta),$$

(5)

where $\xi = \xi_0(\alpha, \beta)$ describes the initial surface $\Sigma(0)$ and $\xi_1$ satisfies $\xi_1 = H_{\Sigma(0)} \xi_1$. We will establish the existence and uniqueness of solutions of system (4.3)-(4.5), under the condition that for every $t \geq 0$, $z(\alpha, \beta, t) \to 0$, $\xi_t(\alpha, \beta, t) \to 0$, as $|\alpha| + |\beta| \to \infty$.

Given a classical solution of (4.3)-(4.5), we can recover the fluid velocity in the whole region $\Omega(t)$ for every fixed time $t$ by solving the Laplace equation:

$$\Delta v = 0 \quad \text{on } \Omega(t),$$

$$v = \xi_t \quad \text{on } \Sigma(t).$$

For the 2-D water wave, we showed that the sign condition (1) always holds for nonself-intersecting interfaces, and (1) was also the key to guaranteeing the well-posedness of the 2-D water wave problem [24]. This suggests that the sign condition (1) will be important and can also be true for the 3-D water wave. So before we proceed further, we study the quantity $a$ defined in (4.2).

Let $\Omega(t)$ be the water region, $\Sigma(t)$ the interface of waterwave at time $t$, and suppose $\Sigma(t)$ is described by $\xi = \xi(\alpha, \beta, t)$, where $\alpha, \beta$ is the Lagrangian parameter, with $\xi_\alpha \times \xi_\beta$ an outward normal of $\Omega(t)$. We assume that at some time $t_0$, $\Omega(t_0)$ and $\Omega(t_0)^c$ are unbounded, simply connected $C^2$ domains, and there are constants $c_0 > 0$, $\mu > 0$, and vectors $e_\alpha$, $e_\beta$, such that

1. $|\xi(\alpha, \beta, t_0) - \xi(\alpha', \beta', t_0)| \geq C_0(|\alpha - \alpha'| + |\beta - \beta'|)$, for $-\infty < \alpha, \beta < \infty$;
2. $\xi_\alpha(\cdot, t_0) - e_\alpha, \xi_\beta(\cdot, t_0) - e_\beta \in H^{s+1/2}(R^2, C(V_3))$, $\xi_\alpha(\cdot, t_0) \in H^{s+1/2}(R^2, C(V_3))$, $\xi_{tt}(\cdot, t_0) \in H^s(R^2, C(V_3))$; and $e_\alpha \times e_\beta = e_3$, for some $s > 5/2$;
3. $|\xi_\alpha(\cdot, t_0) \times \xi_\beta(\cdot, t_0)| \geq \mu$.

We want to prove that the quantity $a = - \frac{\partial p}{\partial n} \geq 2c_0 > 0$ pointwisely on $\Sigma(t_0)$ for some constant $c_0 > 0$.

Apply $\text{div}$ to both sides of (1.1): $v_t + v \cdot \nabla v = - \nabla (z + p)$, and use (1.2), (1.3). We get

$$\text{div}(v \cdot \nabla v) = |\nabla v|^2 = - \Delta (p + z),$$

where $|\nabla v|^2 = |\nabla v_1|^2 + |\nabla v_2|^2 + |\nabla v_3|^2$. Let $p + z$ be the solution in $\Omega(t_0)$ guaranteed by Theorem 2.5 (notice that $p + z - \frac{1}{2} |v|^2$ is harmonic in $\Omega(t_0)$). For any $h \in C^1_0(\Sigma(t_0))$, $h \geq 0$, let $w$ be the harmonic extension of $h$ on $\Omega(t_0)$ given by Theorem
Since the maximal principle, we know there exists a constant \( c \) such that \( w(\eta) = o(|\eta|^{-1}) \), \( \nabla w(\eta) = o(|\eta|^{-2}) \) as \( |\eta| \to \infty \). Applying Green's second identity to \( w \) and \( p + z \) (see [9]), we get

\[
\int_{\Sigma(t_0)} \left( (p + z) \frac{\partial w}{\partial n} - w \frac{\partial (p + z)}{\partial n} \right) dS = \int_{\Omega(t_0)} w |\nabla v|^2 dV.
\]

Since \( p = 0 \) on \( \Sigma(t_0) \) (1.4), we have

\[
(4.6) \quad \int_{\Sigma(t_0)} w(- \frac{\partial p}{\partial n}) dS = \int_{\Sigma(t_0)} (w \frac{\partial z}{\partial n} - z \frac{\partial w}{\partial n}) dS + \int_{\Omega(t_0)} w |\nabla v|^2 dV.
\]

Let's now calculate the right hand side of (4.6). Assume \( \Sigma_b : z = b \) is a plane contained in \( \Omega(t_0) \), with upward unit normal \( n_b = (0,0,1) \). We apply Green's second identity again to \( w \) and \( z \) on the strip region between surfaces \( \Sigma(t_0) \) and \( \Sigma_b \). Since \( w \) and \( z \) are harmonic, we have

\[
\int_{\Sigma(t_0)} \left( w \frac{\partial z}{\partial n} - z \frac{\partial w}{\partial n} \right) dS = \lim_{R \to \infty} \int_{\Sigma(t_0) \cap B(0,R)} (w \frac{\partial z}{\partial n} - z \frac{\partial w}{\partial n}) dS
\]

\[
= \int_{\Sigma_b} w \frac{\partial z}{\partial n} dS - b \int_{\Sigma_b} \frac{\partial w}{\partial n_b} dS
\]

\[
= \int_{\Sigma} w dS,
\]

where \( \int_{\Sigma_b} \frac{\partial w}{\partial n_b} dS = 0 \) is obtained from Green's identity, the assumption that \( \nabla w(\eta) = o(|\eta|^{-2}) \) as \( |\eta| \to \infty \) and an approximation argument. Therefore

\[
(4.7) \quad \int_{\Sigma(t_0)} w(- \frac{\partial p}{\partial n}) dS = \int_{\Sigma_b} w dS + \int_{\Omega(t_0)} w |\nabla v|^2 dV
\]

\[
\geq \int_{\Sigma} w dS.
\]

Let \( G = G(\eta, \xi) \) be the (Dirichlet) Green's function for \( \Omega(t_0) \). We know from Green's representation formula that

\[
w(\eta) = \int_{\Sigma(t_0)} h(\xi) \frac{\partial G(\eta, \xi)}{\partial n(\xi)} dS(\xi) \quad \text{for } \eta \in \Omega(t_0).
\]

Therefore (4.7) implies that

\[
\int_{\Sigma(t_0)} h(\xi)(- \frac{\partial p}{\partial n}(\xi)) dS(\xi) \geq \int_{\Sigma_b} w(\eta) dS(\eta)
\]

\[
= \int_{\Sigma(t_0)} h(\xi)(\int_{\Sigma_b} \frac{\partial G(\eta, \xi)}{\partial n(\xi)} dS(\eta)) dS(\xi).
\]

Since \( h \in C_0^1(\Sigma(t_0)) \), \( h \geq 0 \) is arbitrary, we conclude

\[
a = - \frac{\partial p}{\partial n}(\xi) \geq \int_{\Sigma_b} \frac{\partial G(\eta, \xi)}{\partial n(\xi)} dS(\eta).
\]

From the maximal principle, we know there exists a constant \( c_0 > 0 \), such that

\[
\int_{\Sigma_b} \frac{\partial G(\eta, \xi)}{\partial n(\xi)} dS(\eta) \geq 2c_0, \quad \text{for all } \xi \in \Sigma(t_0).
\]

**Remark.** Green's identities are justified on unbounded domains here because of the decay properties and the \( L^2 \) integrability of our functions involved.
Lemma 4.1. Assume that at time $t_0$, the water region $\Omega(t_0)$ is an unbounded $C^2$ domain, $\Omega(t_0)$ and $\Omega(t_0)^c$ are simply connected, and $\Sigma(t_0)$ satisfies assumptions 1. 2. 3. above. Then

$$a = -\frac{\partial p}{\partial n}(\xi) \geq \int_{\Sigma_b} \frac{\partial G(\eta, \xi)}{\partial n(\xi)} dS(\eta) \geq 2c_0 > 0,$$

for all $\xi \in \Sigma(t_0)$, where $\Sigma_b : z = b$ is a plane contained in $\Omega(t_0)$, and $c_0 > 0$ is a constant depending only on $\Sigma(t_0)$.

As an immediate consequence of Lemma 4.1 and (4.3), we have

$$a = |\xi_{tt} + e_3|.$$

Remark 1. Our original proof for the 2-D sign condition [24] doesn’t apply here, since it uses the Riemann mapping. As we mentioned in §1, the idea of expressing $a$ as $-\frac{\partial p}{\partial n}$ and using the maximal principle is from R. Caflisch and T. Hou. The result of Lemma 4.1 shows that for any solutions of the water wave problem, it is necessary that the pressure is positive inside the water region. This is consistent with the physical requirement that pressure is nonnegative.

Remark 2. The prove of Lemma 4.1 is also valid for the 2-D water wave and Lemma 4.1 in the 2-D context coincides with Lemma 3.1 in [24]. In 2-D, the function $\int_{\Sigma_b} \frac{\partial G(\eta, \xi)}{\partial n(\xi)} dS(\eta)$ is the same as the function $h_\alpha$ in Lemma 3.1 of [24].

System (4.3)-(4.5) is still a nonlinear, nonlocal system. A standard method for solving such a system is to reduce it to a quasilinear system and solve the quasilinear system. We will do this in the next sections.

§5. Reduction to a Quasilinear System

In this section, we reduce (4.3)-(4.5) to a quasilinear system. Recall the velocity $v = \xi_t$ on $\Sigma(t)$ and $v$ is Clifford analytic on $\Omega(t)$. Therefore $\partial_x v$, $\partial_y v$, $\partial_z v$ are also Clifford analytic on the same region. Using the notation in (3.9), we have

$$\partial_x \xi_t = H_{\Sigma(t)}(\partial_x \xi_t), \quad \partial_y \xi_t = H_{\Sigma(t)}(\partial_y \xi_t), \quad \partial_z \xi_t = H_{\Sigma(t)}(\partial_z \xi_t).$$

Now let’s reduce the system (4.3)-(4.4). We use the same notations as in the previous section. Letting $N = \xi_\alpha \times \xi_\beta$, (4.3) becomes

$$\xi_{tt} + e_3 = \frac{a}{|N|} N.$$

Taking the derivative with respect to $t$ on both sides of (5.2), we get

$$\xi_{ttt} = \frac{a}{|N|} N_t + \left( \frac{a}{|N|} \right)_t N.$$
We first calculate \( \frac{a}{|N|} N_t \). Let \( N = (N_1, N_2, N_3) \), and \( i = (1, 0, 0) \), \( j = (0, 1, 0) \), \( k = (0, 0, 1) \). In terms of vector calculus, we have

\[
N_t = \xi_{t\alpha} \times \xi_{t\beta} + \xi_{t\alpha} \times \xi_{t\beta}
\]

\[
= (\xi_{t\alpha} \cdot \nabla)v \times \xi_{t\beta} + \xi_{t\alpha} \times (\xi_{t\beta} \cdot \nabla)v
\]

\[
= i \times ((\xi_{t\alpha} \cdot \nabla)v_1)\xi_{t\beta} - (\xi_{t\beta} \cdot \nabla v_1)\xi_{t\alpha}
\]

\[
+ j \times ((\xi_{t\alpha} \cdot \nabla)v_2)\xi_{t\beta} - (\xi_{t\beta} \cdot \nabla v_2)\xi_{t\alpha}
\]

\[
+ k \times ((\xi_{t\alpha} \cdot \nabla)v_3)\xi_{t\beta} - (\xi_{t\beta} \cdot \nabla v_3)\xi_{t\alpha}
\]

\[
= i \times ((\xi_{t\alpha} \times \xi_{t\beta}) \cdot \nabla v_1) + j \times ((\xi_{t\alpha} \times \xi_{t\beta}) \cdot \nabla v_2) + k \times ((\xi_{t\alpha} \times \xi_{t\beta}) \cdot \nabla v_3)
\]

\[
= (i \cdot \nabla v_1 + j \cdot \nabla v_2 + k \cdot \nabla v_3)(\xi_{t\alpha} \times \xi_{t\beta})
\]

\[
= -N_1 \partial_x v - N_2 \partial_y v - N_3 \partial_z v
\]

\[
= -(N \cdot \nabla) v = -(N \cdot \nabla) v = -|N| \nabla \xi_t;
\]

Here we used the fact that \( i \cdot \nabla v_1 + j \cdot \nabla v_2 + k \cdot \nabla v_3 = \partial_x v + \partial_y v + \partial_z v = \text{div} v = 0 \)

Therefore

\[
\frac{a}{|N|} N_t = -a \nabla \xi_t.
\]

To calculate the term \( \left( \frac{a}{|N|} \right)_t N \), we use the relation

\[
\left( \frac{a}{|N|} \right)_t N = \xi_{tt} - \frac{a}{|N|} N_t.
\]

Taking the derivative twice with respect to \( t \) on both sides of (4.4): \( \xi_t = H_{\Sigma(t)} \xi_t \), we get

\[
\xi_{tt} = \partial_t^2 (H_{\Sigma(t)} \xi_t) = \partial_t (H_{\Sigma(t)} \xi_t + [\partial_t, H_{\Sigma(t)}] \xi_t)
\]

\[
= H_{\Sigma(t)} \xi_{ttt} + [\partial_t, H_{\Sigma(t)}] \xi_{tt} + \partial_t ([\partial_t, H_{\Sigma(t)}] \xi_t);
\]

then

\[
(5.7) \quad \xi_{ttt} - H_{\Sigma(t)} \xi_{ttt} = [\partial_t, H_{\Sigma(t)}] \xi_{tt} + \partial_t ([\partial_t, H_{\Sigma(t)}] \xi_t).
\]

On the other hand, we have from (5.4), (5.2) and (5.1) that

\[
-\frac{a}{|N|} N_t = \left( \frac{a}{|N|} \right) N \cdot \nabla \xi_t = (\xi_t + k \cdot \nabla \xi) \xi_t
\]

\[
= x_{tt} \partial_x \xi_t + y_{tt} \partial_y \xi_t + (z_{tt} + 1) \partial_z \xi_t
\]

\[
= x_{tt} H_{\Sigma(t)}(\partial_x \xi_t) + y_{tt} H_{\Sigma(t)}(\partial_y \xi_t) + (z_{tt} + 1) H_{\Sigma(t)}(\partial_z \xi_t),
\]

therefore

\[
-\frac{a}{|N|} N_t = -H_{\Sigma(t)}(\xi_t + k \cdot \nabla \xi) \xi_t
\]

\[
\]

\[
= x_{tt} H_{\Sigma(t)}(\partial_x \xi_t) + y_{tt} H_{\Sigma(t)}(\partial_y \xi_t) + (z_{tt} + 1) H_{\Sigma(t)}(\partial_z \xi_t)
\]

\[
- H_{\Sigma(t)}(x_{tt} \partial_x \xi_t + y_{tt} \partial_y \xi_t + (z_{tt} + 1) \partial_z \xi_t)
\]

\[
= [x_{tt}, H_{\Sigma(t)}](\partial_x \xi_t) + [y_{tt}, H_{\Sigma(t)}](\partial_y \xi_t) + [z_{tt}, H_{\Sigma(t)}](\partial_z \xi_t).
\]
Adding (5.8) to (5.7), we obtain
\[
\left(\frac{a}{|N|}\right)_t N - H_{\Sigma(t)}\left(\left(\frac{a}{|N|}\right)_t N\right)
= \xi_{ttt} - H_{\Sigma(t)}\xi_{tt} - \frac{a}{|N|}N_t - H_{\Sigma(t)}(-\frac{a}{|N|}N_t)
\]
\[
= \left[\partial_t, H_{\Sigma(t)}\right]\xi_{tt} + \partial_t \left(\left[\partial_t, H_{\Sigma(t)}\right]\xi_t\right)
+ [xt_{tt}, H_{\Sigma(t)}]\partial_x\xi_t + [yt_{tt}, H_{\Sigma(t)}]\partial_y\xi_t + [zt_{tt}, H_{\Sigma(t)}]\partial_z\xi_t.
\]
We want to single out \(\left(\frac{a}{|N|}\right)_t N\). Notice that \(n\left(\frac{a}{|N|}\right)_t N = -n\left(\frac{a}{|N|}\right)_t |N|\) is a real-valued function, and \(nH_{\Sigma(t)} = -H_{\Sigma(t)}^*n\); we multiply by \(-n\) at the left to both sides of (5.9), then take the real part. We get on the left hand side
\[
\Re\{-n\left(\frac{a}{|N|}\right)_t N - H_{\Sigma(t)}\left(\left(\frac{a}{|N|}\right)_t N\right)\}
= \left(\frac{a}{|N|}\right)_t |N| + \Re\{H_{\Sigma(t)}^*\left(\left(\frac{a}{|N|}\right)_t |N|\right)\}
= \left(\frac{a}{|N|}\right)_t |N| + K^*\left(\left(\frac{a}{|N|}\right)_t |N|\right)
= (I + K^*)\left(\left(\frac{a}{|N|}\right)_t |N|\right),
\]
therefore
\[
(I + K^*)\left(\frac{a}{|N|}\right)_t |N| = -\Re\{n\left[\partial_t, H_{\Sigma(t)}\right]\xi_{tt} + \partial_t \left(\left[\partial_t, H_{\Sigma(t)}\right]\xi_t\right)
+ [xt_{tt}, H_{\Sigma(t)}]\partial_x\xi_t + [yt_{tt}, H_{\Sigma(t)}]\partial_y\xi_t + [zt_{tt}, H_{\Sigma(t)}]\partial_z\xi_t\}.
\]
Consequently,
\[
\left(\frac{a}{|N|}\right)_t N = \left(\frac{a}{|N|}\right)_t |N| n = -n(I + K^*)^{-1}(\Re\{nf(\xi, \xi_t, \xi_{tt})\})
\]
where
\[
f(\xi, \xi_t, \xi_{tt}) = |\partial_t, H_{\Sigma(t)}\xi_{tt} + \partial_t \left(\left[\partial_t, H_{\Sigma(t)}\right]\xi_t\right)
+ [xt_{tt}, H_{\Sigma(t)}]\partial_x\xi_t + [yt_{tt}, H_{\Sigma(t)}]\partial_y\xi_t + [zt_{tt}, H_{\Sigma(t)}]\partial_z\xi_t.
\]
Placing the highest order terms to the left, we get from (5.2), (5.5), (5.11) the following equation:
\[
\xi_{ttt} + a \nabla_n \xi_t = -n(I + K^*)^{-1}(\Re\{nf(\xi, \xi_t, \xi_{tt})\}),
\]
where \(a = |\xi_t + e_3|, n = \frac{\xi_t + e_3}{|\xi_t + e_3|}, \) and \(f(\xi, \xi_t, \xi_{tt})\) is as given in (5.12). Now let's calculate \(f(\xi, \xi_t, \xi_{tt})\). Recall that we have calculated the commutator \([\partial_t, H_{\Sigma(t)}]f\) in Lemma 3.1 for the scalar-valued function \(f\). Applying \((\partial_t)\) to each component of \(\xi_{tt}\) then multiplying \(e_j\) to the right and adding them up, we obtain
\[
[\partial_t, H_{\Sigma(t)}]\xi_{tt} = p.v. \int K(\xi' - \xi) \left\{((\xi_t - \xi') \times \xi_{tt}) \xi_{ttt}\right\} da'd\beta',
\]
where \(\xi = |\xi_t + e_3|, \) and \(f(\xi, \xi_t, \xi_{tt})\) is as given in (5.12). Now let's calculate \(f(\xi, \xi_t, \xi_{tt})\). Recall that we have calculated the commutator \([\partial_t, H_{\Sigma(t)}]f\) in Lemma 3.1 for the scalar-valued function \(f\). Applying \((\partial_t)\) to each component of \(\xi_{tt}\) then multiplying \(e_j\) to the right and adding them up, we obtain
\[ [\partial_t, H_{\Sigma(t)}] \xi_t = p.v. \int\int K(\xi' - \xi) \{((\xi_t - \xi'_t) \times \xi'_l) \xi'_l \} \, d\alpha' \, d\beta'; \]

(5.15)

\[ \text{then} \]

\[ \partial_t ([\partial_t, H_{\Sigma(t)}] \xi_t) \]

\[ = p.v. \int\int K(\xi' - \xi) \{((\xi_t - \xi'_t) \times \xi'_l) \xi'_l - ((\xi_t - \xi'_t) \times \xi'_t) \xi'_t \} \, d\alpha' \, d\beta'; \]

(5.16)

\[ + p.v. \int\int K(\xi' - \xi) \{((\xi_t - \xi'_t) \times \xi'_l) \xi'_l - ((\xi_t - \xi'_t) \times \xi'_t) \xi'_t \} \, d\alpha' \, d\beta'; \]

\[ + p.v. \int\int K(\xi' - \xi) \{((\xi_t - \xi'_t) \times \xi'_l) \xi'_l - ((\xi_t - \xi'_t) \times \xi'_t) \xi'_t \} \, d\alpha' \, d\beta'; \]

\[ + p.v. \int\int \partial_t \{ K(\xi' - \xi) \} \{((\xi_t - \xi'_t) \times \xi'_l) \xi'_l - ((\xi_t - \xi'_t) \times \xi'_t) \xi'_t \} \, d\alpha' \, d\beta'. \]

We want to further reduce the last term in (5.16). Since for any vector \( \eta \),

\[ (\eta \times \xi) \xi = (\eta \times \xi)(\eta \cdot \nabla \xi) \xi = (\eta \times (\xi \cdot \nabla \xi)) \xi = (\eta \cdot (\xi \times \nabla \xi)) \xi, \]

(5.17)

where in the last equality we used the fact that \( \nu \) is Clifford analytic on \( \Omega(t) \), that is, \( \partial_\xi \xi = \partial_\nu(\xi) = 0 \), we get, using (5.17) and (3.5), and integration by parts, that

\[ p.v. \int\int \partial_t \{ K(\xi' - \xi) \} \{((\xi_t - \xi'_t) \times \xi'_l) \xi'_l - ((\xi_t - \xi'_t) \times \xi'_t) \xi'_t \} \, d\alpha' \, d\beta'; \]

(5.18)

\[ = p.v. \int\int \{\partial_\alpha' K ((\xi'_l - \xi_t) \times \xi'_t) + \partial_\beta' K ((\xi'_l - \xi_t) \times \xi'_t)\} \{((\xi_t - \xi'_t) \cdot \nabla \xi) \xi'_t \} \, d\alpha' \, d\beta'; \]

\[ = -p.v. \int\int \{\partial_\alpha' K ((\xi'_l - \xi_t) \times \xi'_t) + \partial_\beta' K ((\xi'_l - \xi_t) \times \xi'_t)\} \{((\xi_t - \xi'_t) \cdot \nabla \xi) \xi'_t \} \, d\alpha' \, d\beta'; \]

\[ - p.v. \int\int K(\xi' - \xi) (\xi'_l - \xi_t) \xi'_l \times (\xi_t - \xi'_t) \{((\xi_t - \xi'_t) \cdot \nabla \xi) \xi'_t \} \, d\alpha' \, d\beta'; \]

\[ + p.v. \int\int K(\xi' - \xi) (\xi'_l - \xi_t) \xi'_l \cdot (\xi_t - \xi'_t) \{((\xi_t - \xi'_t) \cdot \nabla \xi) \xi'_t \} \, d\alpha' \, d\beta'; \]

\[ - p.v. \int\int K(\xi' - \xi) (\xi'_l - \xi_t) \xi'_l \cdot (\xi_t - \xi'_t) \{((\xi_t - \xi'_t) \cdot \nabla \xi) \xi'_t \} \, d\alpha' \, d\beta'. \]
We also have from (5.17) that

\begin{equation}
(5.19)
[z_{tt}, H_{\Sigma(t)}](\partial_x \xi_t) + [y_{tt}, H_{\Sigma(t)}](\partial_y \xi_t) + [z_{tt}, H_{\Sigma(t)}](\partial_z \xi_t)
= p.v. \int K(\xi' - \xi) (\xi_{\alpha'} \times \xi_{\beta'}) ((\xi_{tt} - \xi_{tt}') \cdot \nabla \xi') \xi'_t d\alpha' d\beta'
= p.v. \int K(\xi' - \xi) \{((\xi_{tt} - \xi_{tt}') \times \xi_{\alpha'})\xi'_{t\alpha'} - ((\xi_{tt} - \xi_{tt}') \times \xi_{\alpha'})\xi'_{t\beta'}\} d\alpha' d\beta'.
\end{equation}

Therefore

\begin{equation}
(5.20)
f(\xi, \xi_t, \xi_{tt})
= 2 p.v. \int K(\xi' - \xi) \{((\xi_{tt} - \xi_{tt}') \times \xi_{\alpha'})\xi'_{t\alpha'} - ((\xi_{tt} - \xi_{tt}') \times \xi_{\alpha'})\xi'_{t\beta'}\} d\alpha' d\beta'
+ \text{p.v.} \int K(\xi' - \xi) \{((\xi_t - \xi_t') \times \xi_{t\beta'})\xi'_{t\alpha'} - ((\xi_t - \xi_t') \times \xi_{t\alpha'})\xi'_{t\beta'}\} d\alpha' d\beta'
+ 2 \text{p.v.} \int K(\xi' - \xi) \{((\xi_t - \xi_t') \times \xi_{t\beta'})\xi'_{t\alpha'} - ((\xi_t - \xi_t') \times \xi_{t\alpha'})\xi'_{t\beta'}\} d\alpha' d\beta'
- \text{p.v.} \int K(\xi' - \xi) (\xi_t' - \xi_t) \times \xi_{t\beta'} \{(\xi_t - \xi_t') \cdot \partial_{\alpha'} \nabla \xi'\} \xi_t' d\alpha' d\beta'
- \text{p.v.} \int K(\xi' - \xi) \{(\xi_t' - \xi_t) \times \xi_{t\beta'} (\xi_{t\alpha'} \cdot \nabla \xi')\xi_t'
+ \xi_{t\alpha'} (\xi_t' - \xi_t) (\xi_{t\beta'} \cdot \nabla \xi')\xi_t'\} d\alpha' d\beta'
- \text{p.v.} \int K(\xi' - \xi) \{(\xi_{t\alpha'} \times \xi_{t\beta'}) + (\xi_{t\alpha'} \times \xi_{t\beta'})\} \{(\xi_t - \xi_t') \cdot \nabla \xi'\} \xi_t' d\alpha' d\beta'.
\end{equation}

So we convert (4.3)-(4.4) into the following quasilinear equation: Suppose \( \xi = \xi(\alpha, \beta; t) \) is a solution of (4.3)-(4.4). Let \( u = \xi_t \). Then \( u \) is necessarily a solution of the quasilinear equation

\begin{equation}
(5.21)
u_{tt} + a \nabla_n u = -\nabla(I + \widetilde{K}^*)^{-1}(\Re \{\nabla f(\xi, u, u_t)\}),
\end{equation}

where

\[ a = |u_t + e_3|, \quad \nabla = \frac{u_t + e_3}{|u_t + e_3|}, \]

\[ \xi(\alpha, \beta, t) = \xi(\alpha, \beta, 0) + \int_0^t u(\alpha, \beta, s) \, ds, \quad \xi = \frac{1}{2}(u + H_{\Sigma(t)} u), \]
(5.22) \[ f(\xi, u, u_t) = 2 \text{p.v.} \int K(\xi' - \xi) \left\{ ((u_t - u'_t) \times \xi_{t'}) \delta_{\alpha'} - ((u_t - u'_t) \times \xi'_{t'}) \delta_{t'} \right\} \, d\alpha'd\beta' + \text{p.v.} \int K(\xi' - \xi) \left\{ ((u - u') \times u'_{\alpha'}) \delta_{\alpha'} - ((u - u') \times u'_{t'}) \delta_{t'} \right\} \, d\alpha'd\beta' + 2 \text{p.v.} \int K(\xi' - \xi) \left\{ ((u - u') \times \xi'_{t'}) \delta_{t'} - ((u - u') \times \xi'_{\alpha'}) \delta_{\alpha'} \right\} \, d\alpha'd\beta' + \text{p.v.} \int K(\xi' - \xi) \left\{ (u - u') \times \xi_{\alpha'} \cdot \partial_{\alpha'} \nabla_{\xi'} \right\} \delta_{t'} \, d\alpha'd\beta' + \text{p.v.} \int K(\xi' - \xi) \left\{ (u - u') \times \partial_{\alpha'} \nabla_{\xi'} \right\} \delta_{\alpha'} \, d\alpha'd\beta', \]

Here \( \nabla_u u \) is the normal derivative of \( u \), \( \nabla_{\xi'} \) is the space variable gradient of \( u \) and \( H_{\Sigma(t)} \) is the Hilbert transform of \( u \) with respect to the surface \( \Sigma(t) : \xi = \xi(\alpha, \beta, t) \) defined in (5.22) and the lower region \( \Omega(t) \) bounded by \( \Sigma(t) \). For the real-valued function \( g \),

(5.23) \[ \tilde{K}^* g = \mathcal{R} \{ \hat{n} H_{\Sigma(t)}(\hat{n} g) \}. \]

Notice that a solution \( u \) of (5.21)-(5.23) is not obviously analytic, and does not obviously give \( \hat{n} = n \). In \( \S 7 \), we will show that a solution of (5.21)-(5.23) with proper initial data is analytic and gives rise to a solution of (4.3)-(4.4).

**Initial data.** We need to transform the initial data (4.5) into an initial data for (5.21)-(5.23). We will do so by first finding a formula expressing \( a \), consequently expressing \( \xi_{tt} \), as a function of \( \xi_t \) and \( \xi \). Since \( \xi_{tt} + e_3 = a \cdot n \), we have

\[ a = -n(\xi_{tt} + e_3), \]

therefore

(5.24) \[ a - n \cdot e_3 = -n \xi_{tt} - n \times e_3. \]

Now taking the derivative with respect to \( t \) on both sides of (4.4), we get \( \xi_{tt} = \partial_t (H_{\Sigma(t)} \xi_t) = H_{\Sigma(t)} \xi_{tt} + [\partial_t, H_{\Sigma(t)}] \xi_t \), therefore

\[ \xi_{tt} - H_{\Sigma(t)} \xi_{tt} = [\partial_t, H_{\Sigma(t)}] \xi_t. \]

Consequently

\[ n \xi_{tt} + H_{\Sigma(t)}^*(n \xi_{tt}) = n \xi_{tt} - n H_{\Sigma(t)} \xi_{tt} = n [\partial_t, H_{\Sigma(t)}] \xi_t. \]

From (5.24) and the fact that \( a - n \cdot e_3 \) is a real-valued function, we have

\[ (I + K^*)(a - n \cdot e_3) = -\mathcal{R} \{ (I + H_{\Sigma(t)}^*) (n \xi_{tt} + n \times e_3) \} = -\mathcal{R} \{ n [\partial_t, H_{\Sigma(t)}] \xi_t + H_{\Sigma(t)}^*(n \times e_3) \} \]

so

(5.25) \[ a = n \cdot e_3 - (I + K^*)^{-1} \mathcal{R} \{ n [\partial_t, H_{\Sigma(t)}] \xi_t + H_{\Sigma(t)}^*(n \times e_3) \} \]
where \([\partial_t, H_{\Sigma(t)}] \xi_t\) is as given in (5.15). Since \(\xi_{tt} + e_3 = \mathbf{n}\), we have

\[
(5.26) \quad \xi_{tt} = -e_3 + (\mathbf{n} \cdot e_3) \mathbf{n} - \mathbf{n}(I + \mathcal{K}^*)^{-1}(\mathbb{R}\{\mathbf{n} [\partial_t, H_{\Sigma(t)}] \xi_t + H_{\Sigma(t)}^* (\mathbf{n} \times e_3)\}).
\]

We can now determine the initial data of (5.21)-(5.23). Assume that the initial surface \(\Sigma(0)\) divides \(\mathbb{R}^3\) into two simply connected, unbounded \(C^2\) domains, \(\Sigma(0)\) approaches the \(xy\)-plane at infinity, and assume water occupies the lower domain \(\Omega(0)\). Without loss of generality, we choose the parameterization of \(\Sigma(0)\) such that \(\xi_{0,\alpha} \times \xi_{0,\beta}\) is an outer normal of \(\Omega(0)\),

\[
(5.27) \quad |\xi_{0,\alpha} \times \xi_{0,\beta}| \geq 2\mu, \quad -\infty < \alpha, \beta < \infty,
\]

for some constant \(\mu > 0\), and for some unit vectors \(e_{\alpha}, e_{\beta}\), with \(e_{\alpha} \times e_{\beta} = e_3\), \(\xi_{0,\alpha} - e_{\alpha} \to 0, \xi_{0,\beta} - e_{\beta} \to 0\) as \(|\alpha| + |\beta| \to \infty\). For this parameterization, we know that there is a constant \(C_0 > 0\), such that

\[
(5.28) \quad |\xi_{0,\alpha,\beta} - \xi_{0,\alpha',\beta'}| \geq 2C_0(|\alpha - \alpha'| + |\beta - \beta'|), \quad \text{for} \quad -\infty < \alpha, \beta < \infty.
\]

Let

\[
(4.5') \quad \xi(\alpha, \beta, 0) = \xi_0(\alpha, \beta), \quad \xi_t(\alpha, \beta, 0) = \xi_1(\alpha, \beta)
\]

be the initial data for (4.3)-(4.4), where \(\xi_1\) satisfies \(\xi_1 = H_{\Sigma(0)} \xi_1\). We take the corresponding initial data for (5.21)-(5.23)

\[
(5.29) \quad u(\alpha, \beta, 0) = u_0(\alpha, \beta), \quad u_t(\alpha, \beta, 0) = u_1(\alpha, \beta)
\]

such that \(u_0 = \xi_1\), and

\[
(5.30) \quad u_1 = -e_3 + (\mathbf{n}_0 \cdot e_3) \mathbf{n}_0 - \mathbf{n}_0 (I + \mathcal{K}^*)^{-1}(\mathbb{R}\{\mathbf{n}_0 [\partial_t, H_{\Sigma(0)}] u_0 + H_{\Sigma(0)}^* (\mathbf{n}_0 \times e_3)\})
\]

where \(\mathbf{n}_0\) is the outer unit normal of \(\Omega(0)\), \(\mathcal{K}^*\) is the adjoint of the double layer potential defined by \(\Sigma(0)\) and lower region \(\Omega(0)\), and

\[
[\partial_t, H_{\Sigma(0)}] u_0 = p.v. \int \int K(\xi' - \xi) \{(u_0 - u_0') \times \xi_{0,\alpha,\beta} u_0' \times \xi_{0,\alpha,\beta}'
\]

\[
- (u_0 - u_0') \times \xi_{0,\alpha,\beta}' u_0' \}\ d\alpha' d\beta'.
\]

We know \(\mathbf{n}_0 = \frac{u_1 + e_3}{|u_1 + e_3|}\). If \(\Sigma(0)\) further satisfies the assumption 2. of Lemma 4.1, we have that

\[
(5.31) \quad a_0 = |u_1 + e_3| \geq 2c_0
\]

for some positive constant \(c_0\).

In the next section, we will study the well-posedness of the quasilinear system (5.21)-(5.23), with initial data (5.29) satisfying (5.27), (5.28), (4.5'), (5.30) and (5.31).

§6. Well-posedness of the Quasilinear System

In this section, we show that the quasilinear system (5.21)-(5.23), (5.29) is uniquely solvable in certain Sobolev spaces. Our approach is standard. That is we first solve the linear system defined on a given collection of surfaces \(\Sigma(t), t \in [0, T]\), and then use iteration to solve the quasilinear system. Solutions of both the linear and quasilinear systems are obtained by proper energy estimates, iteration and the fixed point theorem. This approach is very much the same as in the 2-D case; see
Lemma 6.1 (Sobolev embedding \cite{10}).

Lemma 6.2. Let $0 \leq \tau < 1$, let $m$ be an integer $\geq 1$, and let $s \geq 1$. For $a, u \in \mathcal{S}(R^2)$, we have

\begin{enumerate}
  \item $\|a, D^m(1 + |D|)u\| \leq k_0(\|a\|_m + |u| + \|u\|_m + \|u\|_m + \|a\|_{q+1}).$
  \item $\|a, (1 + |D|)^s u\| \leq k_0(\|a\|_s + |u| + \|u\|_{s-1} + |a|_{q+1}).$
  \item $\|a, (1 + |D|)u\| \leq k_0\|a\|_{1+q}.$
  \item $\|a, |D|^{1/2}D^{1/2}u\| \leq k_0\|a\|_{1+q}.$
\end{enumerate}

where $k_0$ is a constant independent of $a$ and $u$.

Lemma 6.2 can be proved easily by using Fourier analysis. We omit the proof. The following deep result was obtained by Coifman, McIntosh and Meyer \cite{4} for $n = 2$, and Coifman, David and Meyer \cite{5} for general $n$.

Theorem 6.3 (\cite{4}, \cite{5}, see also \cite{13}). Let $\theta : R^k \rightarrow R$ be even and $C^\infty$, and let $A : R^{n-1} \rightarrow R$, $B : R^{n-1} \rightarrow R^k$ be Lipschitz and

$$K(z, x) = \frac{A(z) - A(x)}{|z - x|^n} \theta \left[ \frac{|B(z) - B(x)|}{|z - x|} \right].$$
Then the operator
\[ Tf(z) = \text{p.v.} \int K(z, x) g(x) \, dx \]
is bounded from \( L_2(R^{n-1}) \) to \( L_2(R^{n-1}) \), with
\[ \|Tf\| \leq C\|f\| \]
where \( C = C(M, \theta, n) \), and \( \| \nabla A\|_{\infty} \leq M, \| \nabla B\|_{\infty} \leq M \).

**Lemma 6.4.** Let \( t \in [0, T] \) be fixed. For \( u \in \mathcal{S}(R^2) \), \( a \in H^{p_1}(R^2) \), \( b \in H^{p_2}(R^2) \), we have
a. \( H_{\Sigma(t)} \) is bounded from \( H^r(R^2) \) to \( H^r(R^2) \), for \( 0 \leq r \leq s + 1/2 \), with
\[ \|H_{\Sigma(t)} u\|_r \leq k_{r,1} \|u\|_r, \]
b. \( \|a H_{\Sigma(t)} u\|_r \leq k_{r,1} \|a\|_{\text{max}\{r,1+q\}} \|u\|_{r-1} \), for \( 1 \leq r \leq \min\{p_1, s+1/2\} \),
c. \( \|\|a, b, H_{\Sigma(t)}\|_r \leq k_{r,1} \|a\|_{\text{max}\{r,1+q\}} \|b\|_{\text{max}\{r,1+q\}} \|u\|_{r-2} \), for \( 2 \leq r \leq \min\{p_1, p_2, s+1/2\} \),
d. \((\pm I + \mathcal{K}_* )^{-1} \) and \((\pm I + \mathcal{K}_+ )^{-1} \) are bounded from \( H^{r-1}(R^2) \) to \( H^{r-1}(R^2) \), for \( 1 \leq r \leq s + 1/2 \), with
\[ \|(\pm I + \mathcal{K}_* )^{-1} u\|_{r-1} \leq k_{r,2} \|u\|_{r-1} \text{ and } \|(\pm I + \mathcal{K}_+ )^{-1} u\|_{r-1} \leq k_{r,2} \|u\|_{r-1}, \]
where \( k_{r,1} = k_{r,1}(C_0, \mu, M(r)) \), \( k_{r,2} = k_{r,2}(C_0, \mu, M(r), M_1) \) are constants,
\[ \|\xi_\alpha - e_\alpha\|_{\text{max}\{r-1,1+q\}} + \|\xi_\beta - e_\beta\|_{\text{max}\{r-1,1+q\}} \leq M(r), \text{ } \|(\pm I + \mathcal{K}_* )^{-1}\| \leq M_1, \]
\[ \|(\pm I + \mathcal{K}_+ )^{-1}\| \text{ is the operator norm of } (\pm I + \mathcal{K}_+ )^{-1} \text{ from } L_2(R^2) \text{ to } L_2(R^2). \]

**Remark.** If for some fixed \( t \), we assume further that \( m(t) - e_3 = \frac{\xi_\alpha(t) \times \xi_\beta(t)}{|\xi_\alpha(t) \times \xi_\beta(t)|} e_3 \in H^s(R^2, C(V_3)) \), then \((\pm I + \mathcal{K}_+ )^{-1}\) is also bounded from \( H^s(R^2) \) to \( H^s(R^2) \), where \( \mathcal{K}_+ \) is the adjoint of the double layered potential \( \mathcal{K}(t) \) defined on \( \Sigma(t) \).

**Proof of a.** We first prove \( a. \) for \( r \) integers, where \( r = 0, 1, \ldots, [s+1/2], \) \([s+1/2] \) is the largest integer \( \leq s + 1/2 \). We prove by induction.

When \( r = 0, \) \( a. \) follows directly from Theorem 6.3 by taking \( \theta \) even, \( \theta \in C^\infty \), and \( \theta(\eta) = \frac{1}{|\eta|^3} \) on \( |\eta| \geq C_0, B(\alpha, \beta) = \xi(\alpha, \beta, t) \) and \( A = A(\alpha, \beta) \) the components of \( \xi(\alpha, \beta, t) \).

When \( r = 1, \) since
\[ (6.1) \quad \partial H_{\Sigma(t)} u = [\partial, H_{\Sigma(t)}] u + H_{\Sigma(t)} \partial u \]
and from (3.3),
\[ (6.2) \quad [\partial, H_{\Sigma(t)}] u = \text{p.v.} \iint K(\xi' - \xi) (\partial \xi - \partial' \xi') \times (\xi'_\beta' u'_{\alpha'} - \xi'_\alpha' u'_{\beta'}) \, d\alpha' d\beta' \]
\[ = \text{p.v.} \iint K(\xi' - \xi) (\xi'_\alpha' \times \xi'_\beta') \times (\xi'_\beta' u'_{\alpha'} - \xi'_\alpha' u'_{\beta'}) \, d\alpha' d\beta' \]
\[ = \sum_i [a_i, H_{\Sigma(t)}] \mathcal{D}_i u = \sum_i (a_i H_{\Sigma(t)} \mathcal{D}_i u - H_{\Sigma(t)} (a_i \mathcal{D}_i u)) \]
where \( a_i \) are components of \( \partial \xi \), that is, \( \partial \xi = \sum a_i e_i \), \( \mathcal{D}_i u = -\frac{\xi_\alpha \times \xi_\beta}{|\xi_\alpha \times \xi_\beta|^2} e_i \times (\xi_\beta u_\alpha - \xi_\alpha u_\beta) \), we have

\[
(6.3) \quad \partial H_{\Sigma(t)} u = \sum_i (a_i H_{\Sigma(t)} \mathcal{D}_i u - H_{\Sigma(t)}(a_i \mathcal{D}_i u)) + H_{\Sigma(t)} \partial u,
\]

therefore

\[
\| H_{\Sigma(t)} u \|_1 \leq k_{1,1} \| u \|_1,
\]

where \( k_{1,1} \) depends on \( \| \partial \xi \|_\infty, C_0, \mu \).

When \( r = 2 \), we have from (6.3)

\[
\partial^2 H_{\Sigma(t)} u = \sum_i \{ \partial(a_i H_{\Sigma(t)} \mathcal{D}_i u) - \partial(H_{\Sigma(t)}(a_i \mathcal{D}_i u)) \} + \partial H_{\Sigma(t)} \partial u,
\]

therefore \( \| H_{\Sigma(t)} u \|_2 \leq k_{2,1} \| u \|_2 \), where \( k_{2,1} \) depends on \( \| \partial^2 \xi \|_\infty + \| \partial \xi \|_\infty, C_0, \mu \). By interpolation, we have that \( a. \) holds for all \( 0 \leq r \leq 2 \).

Now for \( m \geq 3 \), assume that \( H_{\Sigma(t)} \) is bounded from \( H^{m-1}(R^2) \) to \( H^{m-1}(R^2) \), where \( 2 \leq m - 1 < [s + 1/2] \). From (6.3),

\[
\partial^m H_{\Sigma(t)} u = \sum_i \{ \partial^{m-1}(a_i H_{\Sigma(t)} \mathcal{D}_i u) - \partial^{m-1}(H_{\Sigma(t)}(a_i \mathcal{D}_i u)) \} + \partial^{m-1} H_{\Sigma(t)} \partial u.
\]

Therefore by the induction hypothesis and Lemma 6.2 a., we get

\[
\| \partial^m H_{\Sigma(t)} u \| \leq k_m' \| u \|_m
\]

where \( k_m' \) is a constant depending on \( \| a_i - c_i \|_{m'}, C_0, \) and \( \mu; a_i - c_i \) are components of \( \xi_\alpha - e_\alpha \) or \( \xi_\beta - e_\beta \), \( m' = \max\{ m - 1, 1 + q \} \). In other words, \( k_m' \) is a constant depending on \( \| \xi_\alpha - e_\alpha \|_{m'}, \| \xi_\beta - e_\beta \|_{m'}, C_0, \) and \( \mu \). Using the induction hypothesis again, we obtain that

\[
\| H_{\Sigma(t)} u \|_m \leq k_{m,1} \| u \|_m
\]

where \( k_{m,1} = k_{m,1}(M(m), C_0, \mu) \), and \( \| \xi_\alpha - e_\alpha \|_{m'} + \| \xi_\beta - e_\beta \|_{m'} \leq M(m) \). This proves \( a. \) for \( r \) integers, where \( 0 \leq r \leq [s + 1/2] \), consequently for all \( 0 \leq r \leq [s + 1/2] \) by interpolation.

Now let’s prove \( a. \) for all \( 0 \leq r \leq s + 1/2 \). Let \( 0 < \tau < 1 \). From (6.3), we also have that

\[
\partial^m (1 + |D|)^\tau H_{\Sigma(t)} u = \sum_i \{ \partial^{m-1}(1 + |D|)^\tau (a_i H_{\Sigma(t)} \mathcal{D}_i u)
\]

\[
- \partial^{m-1}(1 + |D|)^\tau (H_{\Sigma(t)}(a_i \mathcal{D}_i u)) \}
\]

\[
+ \partial^{m-1}(1 + |D|)^\tau H_{\Sigma(t)} \partial u.
\]

Since \( a. \) holds for \( r = \tau \), we conclude from a similar induction argument that \( a. \) holds for \( r = 1 + \tau, \ldots, l + \tau \), where \( l = [s + 1/2] \), if \( 0 < \tau \leq s + 1/2 - [s + 1/2] \), and \( l = [s + 1/2] - 1 \), if \( s + 1/2 - [s + 1/2] < \tau < 1 \). Therefore \( a. \) holds for all \( 0 \leq r \leq s + 1/2 \).

**Proof of b.** We only give a detailed proof of \( b. \) for \( r \) integers. For noninteger \( r \), the proof can be carried out using interpolation and induction, as we did for \( a. \)

Since

\[
\partial(a, H_{\Sigma(t)}) u = (\partial a) H_{\Sigma(t)} u + p.v. \int (a - a') \partial K(\xi' - \xi)(\xi'_\alpha x \xi'_\beta) u' d\alpha' d\beta',
\]
and p.v. \( \int (a - a')\partial K(\xi' - \xi)((\xi_\alpha', \xi_\beta') u') da' da'' \) has the type of kernel as in Theorem 6.3, and since \([a, H_{\Sigma(t)}]\) is bounded from \(L_2(R^2)\) to \(L_2(R^2)\), we know that \(b\) holds for \(r = 1\).

Assume that \(b\) holds for \(r = m - 1\), where \(1 \leq m - 1 < \min\{p_1, s + 1/2\}\). Since

\[
\partial^m [a, H_{\Sigma(t)}] u = [\partial^m, a] H_{\Sigma(t)} u + [a, \partial^m H_{\Sigma(t)}] u
\]

(6.4)

and from (6.2),

\[
[a, \partial^m H_{\Sigma(t)}] u = a \partial^m [\partial, H_{\Sigma(t)}] u + m \partial^m - 1 [\partial, H_{\Sigma(t)}] (au)
\]

where \(a_i - e_i \in H^{s-1/2}(R^2)\) are components of \(\xi_\alpha - e_\alpha\) or \(\xi_\beta - e_\beta\), and since

\[
[a, \partial^m H_{\Sigma(t)}] \partial u = \partial^m [a, H_{\Sigma(t)}] \partial u - [\partial^m, a] H_{\Sigma(t)} \partial u,
\]

we have first by taking \(m = 2\) that \(b\) holds for \(r = 2\), therefore for all \(1 \leq r \leq 2\) by interpolation. For general \(m\), we get from the induction hypothesis, Lemma 6.2. and Lemma 6.4. a. that

\[
\| [\partial^m, a] H_{\Sigma(t)} u \| \leq k''_m \| a \|_{\max\{1 + q, m\}} \| u \|_{m - 1},
\]

where \(k''_m\) depends on \(\xi_\alpha - e_\alpha\|^{m'}\), \(\xi_\beta - e_\beta\|^{m'}, C_0\) and \(\mu, m' = \max\{1 + q, m - 1\}\). Using the induction hypothesis again, we obtain

\[
\| [a, H_{\Sigma(t)}] u \|_m \leq k_{m, 1} \| u \|_{m - 1},
\]

where \(k_{m, 1} = k_{m, 1}(M(m), C_0, \mu)\), and \(\| \xi_\alpha - e_\alpha\|^{m'} + \| \xi_\beta - e_\beta\|^{m'} \leq M(m)\). This proves \(b\) for integer \(r\).

Proof of \(c.\) and \(d.\) \(c.\) \(d.\) are proved in the same way as we did for \(a.\) and \(b.\) That is, we first prove by induction for \(r\) integers, then by interpolation and induction for all \(2 \leq r \leq \min\{p_1, p_2, s + 1/2\}\) for \(c.\) and all \(1 \leq r \leq s + 1/2\) for \(d.\) The induction argument for \(c.\) is carried out using identities

\[
\partial^m [a, [b, H_{\Sigma(t)}]] u = [\partial^m, a] [b, H_{\Sigma(t)}] u + [a, \partial^m [\partial, [b, H_{\Sigma(t)}]] u
\]

+ \([a, \partial^m [\partial, [b, H_{\Sigma(t)}]] \partial u - \partial^m [b, H_{\Sigma(t)}] ((\partial a) u),
\]

\[
[\partial, [b, H_{\Sigma(t)}]] u = [\partial b, H_{\Sigma(t)}] u + [b, \partial H_{\Sigma(t)}] u
\]

\[
= [\partial b, H_{\Sigma(t)}] u + \sum_i [b, [a_i, H_{\Sigma(t)}]] \partial u
\]

\[
= [\partial b, H_{\Sigma(t)}] u + \sum_i ([b, [a_i, H_{\Sigma(t)}]] \partial u - [a_i, H_{\Sigma(t)}] \partial u, b] u
\]

and

\[
[a, \partial^m [b, H_{\Sigma(t)}]] \partial u = \partial^m [a, [b, H_{\Sigma(t)}]] \partial u - [\partial^m, a] [b, H_{\Sigma(t)}] \partial u,
\]
Theorem 6.3 and Lemma 6.4 b. The induction argument for \( d \) with regard to \((\pm I + K^*)^{-1}\) is carried out using Theorem 2.4, identities

\[
\partial^m(\pm I + K^*)^{-1} = \partial^{m-1}[\partial, (\pm I + K^*)^{-1}] + \partial^{m-1}(\pm I + K^*)^{-1} \partial
\]

(6.5)

\[
= -\partial^{m-1}(\pm I + K^*)^{-1}[\partial, K^*](\pm I + K^*)^{-1} + \partial^{m-1}(\pm I + K^*)^{-1} \partial
\]

and (6.2), and Lemma 6.4 a. b. It is similar for \((\pm I + K)^{-1}\).

As an immediate consequence of Lemma 6.4, (3.13) and (3.14), we have the following

**Corollary 6.5.** Let \( u \in \mathcal{S}(R^2) \). Then for \( 1 \leq r \leq s + 1/2 \),

\[
k_{r,1}^2([\partial_\alpha u]_{r-1} + [\partial_\beta u]_{r-1}) \leq \|\nabla_n u\|_{r-1} \leq k_{r,2}([\partial_\alpha u]_{r-1} + [\partial_\beta u]_{r-1})
\]

(6.6)

where \( k_{r,2} = k_{r,2}(C_0, \mu, M(r), M_1) \geq 1 \), \( M(r) \) and \( M_1 \) are as in Lemma 6.4.

**Lemma 6.6.** Let \( a \in H^{1+q}(R^2) \). For \( u, w \in \mathcal{S}(R^2) \), we have

a.

\[
|\int_{\Sigma(t)} (aw \nabla_n u + au \nabla_n w) dS| \leq \kappa_0 \|a\|_{1+q} \|u\| + (\int_{\Sigma(t)} u \nabla_n u dS)^{1/2}((\int_{\Sigma(t)} w \nabla_n w dS)^{1/2}),
\]

b.

\[
|\int_{\Sigma(t)} w \nabla_n u dS| \leq (\int_{\Sigma(t)} u \nabla_n u dS)^{1/2}((\int_{\Sigma(t)} w \nabla_n w dS)^{1/2}),
\]

c.

\[
|\int_{\Sigma(t)} w [a, \nabla_n] u dS| \leq \kappa_0 \|a\|_{1+q} \|u\| + (\int_{\Sigma(t)} w \nabla_n w dS)^{1/2})
\]

where \( \kappa_0 = \kappa_0(C_0, \mu, M, M_1) \), and \( \|\xi_\alpha - e_\alpha\|_{1+q} + \|\xi_\beta - e_\beta\|_{1+q} \leq M, M_1 \) as in Lemma 6.4.

**Remark.** If \( a - 1 \in H^{1+q}(R^2) \), Lemma 6.6 holds with \( \|a\|_{1+q} \) in a. and c. replaced by \( \|a - 1\|_{1+q} + 1 \).

**Proof.** We prove Lemma 6.6 by Green’s identity.

Let \( a^h \), \( u^h \), and \( w^h \) be the harmonic extension, given by Theorem 2.5, of \( a, u, \) and \( w \) on \( \Omega(t) \) respectively. By definition: \( \nabla_n u = \frac{\partial u^h}{\partial n} \) and Green’s second identity, we have

\[
\int_{\Sigma(t)} (a \nabla_n u w + au \nabla_n w) dS = \int_{\Sigma(t)} a \frac{\partial (u^h w^h)}{\partial n} dS
\]

(6.7)

\[
= \int_{\Sigma(t)} \frac{\partial a^h}{\partial n} u w dS + 2 \int_{\Omega(t)} a^h \nabla u^h \cdot \nabla w^h dV.
\]

Since

\[
|\int_{\Sigma(t)} \frac{\partial a^h}{\partial n} u w dS| = |\int_{\Sigma(t)} (\nabla_n a) u w dS| \leq |\nabla_n a|_{\infty} \int_{\Sigma(t)} |uw| dS
\]

(6.8)

and

\[
2 |\int_{\Omega(t)} a^h \nabla u^h \cdot \nabla w^h dV| \leq 2 |a^h|_{\infty} (\int_{\Omega(t)} |\nabla u^h|^2 dV)^{1/2} (\int_{\Omega(t)} |\nabla w^h|^2 dV)^{1/2}
\]

\[
\leq 2 |a|_{\infty} (\int_{\Sigma(t)} u \nabla_n u dS)^{1/2} (\int_{\Sigma(t)} w \nabla_n w dS)^{1/2}
\]

(6.9)
where in the last inequality we used the maximal principle: $|a^h|_\infty \leq |a|_\infty$ and Green's identity, therefore

\[
|\int_{\Sigma(t)} (a \nabla_n u w + au \nabla_n w) \, dS| \leq |\nabla_n a|_\infty \int_{\Sigma(t)} |wu| \, dS + 2|a|_\infty (\int_{\Sigma(t)} u \nabla_n u \, dS)^{1/2} (\int_{\Sigma(t)} w \nabla_n w \, dS)^{1/2}.
\]

(6.10)

Now from Theorem 2.5, we have that $\tilde{\eta}$ is given by Theorem 2.5. (Notice that $\tilde{\eta}$ is harmonic on $\Omega(t)$.) Since $\Delta(u^h)^2 = 2|\nabla u^h|^2 \geq 0$ and $(u^h)^2 = \tilde{u}$ on $\Sigma(t)$, we have from the maximal principle that $(u^h)^2 \leq \tilde{u}$ on $\Omega(t)$. Therefore

\[
2 \int_{\Omega(t)} (u^h)^2 |\nabla a^h|^2 \, dV \leq 2 \int_{\Omega(t)} \tilde{u} |\nabla a^h|^2 \, dV = \int_{\Sigma(t)} u^2 \frac{\partial \tilde{a}}{\partial n} \, dS.
\]

Now from Theorem 2.5, we have that

\[
\tilde{a}(\eta) = (a^h)^2(\eta) + \int_{\Sigma(t)} K(\xi' - \eta) \cdot n(\xi')(I + K)^{-1}(a^2)(\xi') \, dS(\xi'), \quad \eta \in \Omega(t),
\]

so

\[
|\frac{\partial \tilde{a}}{\partial n}|_\infty \leq k_0 \|\frac{\partial \tilde{a}}{\partial n}\|_q \leq \kappa_0' \|a\|_1^{2+q}.
\]
Consequently,
\[
\int_{\Sigma(t)} |\alpha, \nabla_n| u w dS \leq \kappa_0 \|\alpha\|_{1+q}(\int_{\Sigma(t)} |uw| dS + (\int_{\Sigma(t)} u^2 dS)^{1/2}(\int_{\Sigma(t)} w \nabla_n w dS)^{1/2}) \leq \kappa_0 \|\alpha\|_{1+q}\|u\|\|w\| + (\int_{\Sigma(t)} w \nabla_n w dS)^{1/2} \]
where \(\kappa_0 = \kappa_0(C_0, \mu, M, M_1)\), and \(\|\xi - e_\alpha\|_{1+q} + \|\xi - e_\beta\|_{1+q} \leq M\), \(M_1\) is as in Lemma 6.4. This proves \(c\). \hfill \Box

Remark. Green’s identity is justified here since \(a^h, u^h, w^h\) have enough integrability and \(u^h, w^h\) have enough decay at infinity; see Theorem 2.5 and it’s remark.

Lemma 6.7. For \(u \in \mathcal{G}(\mathbb{R}^2)\), we have
\[
\kappa_0^{-1} \|u\|_{1/2}^2 \leq \|u\|^2 + \int_{\Sigma(t)} u \nabla_n u dS \leq \kappa_0 \|u\|_{1/2}^2
\]
where \(\kappa_0 = \kappa_0(C_0, \mu, M, M_1) \geq 1\), \(M, M_1\) are as in Lemma 6.6.

Proof. We first prove the right hand side inequality of (6.13). Let \((R_1, R_2) = (\partial_\alpha|D|^{-1}, \partial_\beta|D|^{-1})\) be the Riesz transforms on \(\mathbb{R}^2\),
\[
Rw = (I + \mathcal{K}^*)^{-1}\{p.v. \int_\mathbb{R} (n(\xi) \times K(\xi' - \xi)) \cdot (\xi'_\beta R_1 w - \xi'_\alpha R_2 w) d\alpha d\beta\},
\]
and let \(\mathcal{R}^*\) be the adjoint of \(\mathcal{R}\) on \(L^2(\Sigma(t), dS)\). From (3.13) we know \(\nabla_n u = \mathcal{R}|D| u\). Therefore
\[
\int_{\Sigma(t)} u \nabla_n u dS = \int_{\Sigma(t)} \mathcal{R}^*(u)|D| u dS = \int\int |D|^{1/2}(|\xi_\alpha \times \xi_\beta|\mathcal{R}^*(u))|D|^{1/2} u d\alpha d\beta \leq (\int\int \{D|^{1/2}(|\xi_\alpha \times \xi_\beta|\mathcal{R}^*(u))\}^2 d\alpha d\beta)^{1/2} (\int\int \{|D|^{1/2} u\}^2 d\alpha d\beta)^{1/2} \leq \kappa_0^2 \|u\|^2_{1/2},
\]
where the last inequality follows from Lemma 6.4 and Lemma 6.2, and \(\kappa_0 = \kappa_0(C_0, \mu, M, M_1)\), \(\|\xi_\alpha - e_\alpha\|_{1+q} + \|\xi_\beta - e_\beta\|_{1+q} \leq M\), and \(M_1\) is as in Lemma 6.4. This proves the right hand side inequality of (6.13).

The left hand side inequality of (6.13) is proved similarly. We know from (3.14) that
\[
\partial u = -\partial \xi \cdot (I + H_{\Sigma(t)}) (n(-I + \mathcal{K}^*)^{-1} \nabla_n u).
\]
Since \(|D| = -R_1 \partial_\alpha - R_2 \partial_\beta\), we can also write \(|D| u = \mathcal{R} \nabla_n u\), where
\[
\mathcal{R} w = R_1 \{\xi_\alpha \cdot (I + H_{\Sigma(t)}) (n(-I + \mathcal{K}^*)^{-1} w)\} + R_2 \{\xi_\beta \cdot (I + H_{\Sigma(t)}) (n(-I + \mathcal{K}^*)^{-1} w)\}.
\]
Let $\tilde{R}^*$ be the adjoint of $\tilde{R}$ on $L^2(\Sigma(t), dS)$. Therefore
\[
\int_\Sigma |D|u\, d\lambda_d\beta = \int_\Sigma \left( \frac{1}{|\xi_\alpha \times \xi_\beta|} u \tilde{R} \nabla_n u \right) dS = \int_\Sigma \tilde{R}^* \left( \frac{1}{|\xi_\alpha \times \xi_\beta|} u \right) \nabla_n u \, dS.
\]
Applying Lemma 6.6 b, we get
\[
\int_\Sigma \tilde{R}^* \left( \frac{u}{|\xi_\alpha \times \xi_\beta|} \right) \nabla_n u \, dS \\
\leq \left( \int_\Sigma \left| u \nabla_n u \right| dS \right)^{1/2} \left( \int_\Sigma \left| \tilde{R}^* \left( \frac{u}{|\xi_\alpha \times \xi_\beta|} \right) \right| dS \right)^{1/2},
\]
where
\[
\int_\Sigma \tilde{R}^* \left( \frac{u}{|\xi_\alpha \times \xi_\beta|} \right) \nabla_n \tilde{R}^* \left( \frac{u}{|\xi_\alpha \times \xi_\beta|} \right) \, dS = \int_\Sigma |D| \left( \tilde{R}^* \left( \frac{u}{|\xi_\alpha \times \xi_\beta|} \right) \right) \, d\lambda_d\beta \\
\leq \|u\|_{1/2} \left( \int_\Sigma \left( \frac{|D|}{\tilde{R}^* \left( \frac{u}{|\xi_\alpha \times \xi_\beta|} \right)} \right)^2 \, d\lambda_d\beta \right)^{1/2} \\
\leq \kappa_0 \|u\|_{1/2}^2.
\]
Here we used Lemma 6.4 and Lemma 6.2 again in the last inequality. Therefore
\[
\int_\Sigma |D|u\, d\lambda_d\beta \leq \sqrt{\kappa_0} \left( \int_\Sigma \left| u \nabla_n u \right| dS \right)^{1/2} \|u\|_{1/2},
\]
and consequently
\[
\|u\|_{1/2}^2 \leq \kappa_0 \|u\|^2 + \int_\Sigma \left| u \nabla_n u \right| dS.
\]
This proves the left hand side inequality of (6.13). \qed

Using Lemmas 3.1, 3.2 and a similar argument as in Lemma 6.7, we also have the following

**Lemma 6.8.** Let $a - 1 \in H^{1+q}(R^2)$. For $u \in \mathcal{S}(R^2)$, we have
\[
\left| \int \int a u [\partial_t, \nabla_n] u \, d\lambda_d\beta \right| \leq \kappa_0 \|a - 1\|_{1+q} \|\xi_\beta\|_{2+q} \|u\|_{1/2}^2,
\]
where $\kappa_0 = \kappa_0(C_0, \mu, M, M_1)$, and $M$ and $M_1$ are as in Lemma 6.6.

Let
\[
G = a \nabla_n + \lambda, \quad a = \frac{a}{|\xi_\alpha \times \xi_\beta|},
\]
where $a - 1 \in H^{1+q}(R^2)$ and $\lambda$ is a constant. Also let $(u, v) = \int u v \, d\lambda_d\beta$.

**Lemma 6.9.** Let $a - 1 \in H^{1+q}(R^2)$. Assume that there is a constant $c_0 > 0$, such that $a \geq c_0$. Assume $\lambda \geq |\nabla_n a|_{\infty} |\xi_\alpha \times \xi_\beta|_{\infty} + \frac{c_0}{|\xi_\alpha \times \xi_\beta|_{\infty}}$. Then for $u \in \mathcal{S}(R^2)$,
\[
k_1^{-1} \|u\|_{1/2}^2 \leq \langle Gu, u \rangle \leq \kappa_1 \|u\|_{1/2}^2
\]
where $k_1 \geq \max\{2\lambda + \kappa_0|a|_{\infty}, \frac{|\xi_\alpha \times \xi_\beta|_{\infty}}{c_0} \kappa_0\}$, $\kappa_0$ is the constant in Lemma 6.7.
Proof. Let \(a^h - 1, u^h\) be the harmonic extensions of \(a - 1\) and \(u\) on \(\Omega(t)\), given by Theorem 2.5. From Green's second identity, we have that

\[
(6.19) \int_{\Sigma(t)} au \nabla u \, dS = \frac{1}{2} \int_{\Sigma(t)} a^h \frac{\partial(u^h)^2}{\partial n} \, dS = \frac{1}{2} \int_{\Sigma(t)} \frac{\partial a^h}{\partial n} u^2 \, dS + \int_{\Omega(t)} a^h |\nabla u^h|^2 \, dV,
\]

therefore

\[
\int_{\Sigma(t)} au \nabla u \, dS \geq -|\nabla a|_\infty |\xi_\alpha \times \xi_\beta|_\infty \|u\|^2 + \frac{c_0}{|\xi_\alpha \times \xi_\beta|_\infty} \int_{\Omega(t)} |\nabla u^h|^2 \, dV
\]

\[
\geq -|\nabla a|_\infty |\xi_\alpha \times \xi_\beta|_\infty \|u\|^2 + \frac{c_0}{|\xi_\alpha \times \xi_\beta|_\infty} \int_{\Omega(t)} u \nabla u \, dS
\]

\[
\geq -|\nabla a|_\infty |\xi_\alpha \times \xi_\beta|_\infty \|u\|^2 + \frac{c_0}{|\xi_\alpha \times \xi_\beta|_\infty} (\kappa_0^{-1} \|u\|_1^2 - \|u\|^2),
\]

where in the first inequality we used the maximal principle that \(a^h \geq \min_{\Sigma(t)} a \geq \frac{c_0}{|\xi_\alpha \times \xi_\beta|_\infty}\), and in the last inequality we used Lemma 6.7. Consequently,

\[
(Gu, u) = \int_{\Sigma(t)} au \nabla u \, dS + \lambda \|u\|^2 \geq \frac{c_0}{|\xi_\alpha \times \xi_\beta|_\infty} \kappa_0^{-1} \|u\|_1^2.
\]

On the other hand, we have from (6.19) that

\[
(Gu, u) = \int_{\Sigma(t)} au \nabla u \, dS + \lambda \|u\|^2
\]

\[
\leq |\nabla a|_\infty |\xi_\alpha \times \xi_\beta|_\infty \|u\|^2 + |a|_\infty \int_{\Omega(t)} |\nabla u^h|^2 \, dV + \lambda \|u\|^2
\]

\[
\leq |\nabla a|_\infty |\xi_\alpha \times \xi_\beta|_\infty \|u\|^2 + |a|_\infty \int_{\Sigma(t)} u \nabla u \, dS + \lambda \|u\|^2
\]

\[
\leq (|\nabla a|_\infty |\xi_\alpha \times \xi_\beta|_\infty + \lambda) \|u\|^2 + \kappa_0 |a|_\infty \|u\|_1^2
\]

\[
\leq (2\lambda + \kappa_0 |a|_\infty) \|u\|_1^2.
\]

Taking \(\kappa_1 \geq \max\{2\lambda + \kappa_0 |a|_\infty, \frac{|\xi_\alpha \times \xi_\beta|_\infty}{c_0} \kappa_0\}\), we get (6.18). \(\square\)

For \(t \in [0, T]\) and \(0 \leq \vartheta \leq 1\), let

\[
\Sigma_1(t) : \xi_1 = \xi_1(\alpha, \beta, t), \quad \Sigma_2(t) : \xi_2 = \xi_2(\alpha, \beta, t),
\]

\[
\Sigma(\vartheta; t) : \xi = \vartheta \xi_1(\alpha, \beta, t) + (1 - \vartheta) \xi_2(\alpha, \beta, t).
\]

Assume that \(\Sigma(\vartheta; t)\) satisfies H1 and H3 for all \(t \in [0, T]\) and \(0 \leq \vartheta \leq 1\); and \(\Sigma_1(t), \Sigma_2(t)\) satisfy H1, H2', H3, where

\(H2':\) \(\xi\alpha - e_\alpha, \xi_\beta - e_\beta \in C([0, T], H^{s-1/2}(R^2, C(V_\alpha)))\), \(e_\alpha \times e_\beta = e_3\) and \(\xi_\alpha \in L^\infty([0, T], H^{s+1/2}(R^2, C(V_\alpha)))\).

Lemma 6.10. Let \(t \in [0, T]\) be fixed. Then for \(u \in \mathcal{S}(R^2), a \in H^{p_1}(R^2), b \in H^{p_2}(R^2)\), we have

a. \(|(H_{\Sigma_1(t)} - H_{\Sigma_2(t)})u|_r \leq k_{r, 1} \|\xi_1(t) - \xi_2(t)|_r u|_r, \text{ for } 2 + q \leq r \leq s + 1/2,\)

b. \(|a, H_{\Sigma_1(t)} - H_{\Sigma_2(t)}|_u \leq k_{r, 1} \|a|_r \|\xi_1(t) - \xi_2(t)|_r u|_r - 1, \text{ for } 2 + q \leq r \leq \min\{p_1, s + 1/2\},\)

Then \( H_{r,1} \) and \( \nabla H_{r,2} \); and assume \( i = 1 \) and from (3.2),

\[
(6.20) \quad (H_{3,1}(t) - H_{3,2}(t))u = \int_0^1 [\partial_\theta, H_{3,1}(\theta,t)]u d\theta
\]

and from (3.2),

\[
[\partial_\theta, H_{3,1}(\theta,t)]u = p.v. \int K(\xi' - \xi) ((\partial_\theta \xi - \partial_\theta \xi') \times (\xi' u'_\alpha - \xi' u'_\beta)) d\alpha' d\beta' = \sum_i [a_i, H_{3,1}(\theta,t)] D_i u
\]

where \( a_i \) are components of \( \partial_\theta \xi = \xi_1 - \xi_2 \), that is, \( \xi_1 - \xi_2 = \sum a_i e_i \), and \( D_i u = -\xi_\alpha \times \xi_\beta / |\xi_\alpha \times \xi_\beta|^2 \times (\xi_\beta u_\alpha - \xi_\alpha u_\beta) \), we have from Lemma 6.4. that for \( 2 + q \leq r \leq s + 1/2 \),(6.21)

\[
\|(H_{3,1}(t) - H_{3,2}(t))u\|_r \leq C \int_0^1 \|\partial_\theta, H_{3,1}(\theta,t)]u\|_r d\theta \leq \sum_i \int_0^1 \|a_i, H_{3,1}(\theta,t)] D_i u\|_r d\theta
\]

where \( k_{r,1} = k_{r,1}(C_0, \mu, M(r)) \), and \( \|\xi_\alpha - e_\alpha\|_{r-1} + \|\xi_\beta - e_\beta\|_{r-1} \leq M(r) \), \( i = 1, 2 \). This proves Lemma 6.10. \( \square \)

For fixed \( t \), let \( n_i = \xi_{i,\alpha} \times \xi_{i,\beta} / |\xi_{i,\alpha} \times \xi_{i,\beta}| \) be the unit normal of \( \Sigma_i(t) \), \( i = 1, 2 \). Using a similar argument and Lemma 3.2 we also have the following

**Lemma 6.11.** Let \( t \in [0,T] \) be fixed. For \( u \in S(R^2) \), we have

\[
(6.22) \quad \|\nabla n_1 - \nabla n_2\|_-r \leq k_{r,2} \|\xi_1 - \xi_2\|_r \|u\|_r, \quad \text{for} \ 2 + q \leq r \leq s + 1/2
\]

where \( k_{r,2} = k_{r,2}(C_0, \mu, M(r), M_1) \), and \( \|\xi_\alpha - e_\alpha\|_{r-1} + \|\xi_\beta - e_\beta\|_{r-1} \leq M(r) \), \( i = 1, 2 \), and suppose \( 0 \leq \theta \leq 1 \) \( \|(I + K^*)^{-1}\| \leq M_1 \), where \( K \) is the double layered potential defined on \( \Sigma(\theta; t) \).

An easy consequence of Lemmas 6.10 and 6.11 is the following

**Lemma 6.12.** Assume that \( u \in C([0,T], S(R^2)) \), and \( \Sigma(t) \) satisfies H1, H2 and H3. Then \( H_{\Sigma(t)} u \in C([0,T], H^r(R^2)) \), and \( \nabla u \in C([0,T], H^{r-1}(R^2)) \), for \( 2 + q \leq r \leq s + 1/2 \).

**Linear systems.** Assume that surfaces \( \Sigma(t) \), \( t \in [0,T] \), are given and satisfy the conditions described at the beginning of the last part, in particular H1, H2 and H3; and assume \( \nabla a \) is the normal derivative defined on \( \Sigma(t) \). Assume that \( a \) is a scalar-valued function such that \( a - 1 \in C([0,T], H^s(R^2)) \), \( a_i \in C([0,T], H^{1+r}(R^2)) \) and \( a \geq c_0 \) for some constant \( c_0 > 0 \). Let \( a = \frac{\xi_{i,\alpha} \times \xi_{i,\beta}}{|\xi_{i,\alpha} \times \xi_{i,\beta}|} \), and let \( G \) be the operator
Lemma 6.1, Corollary 6.5 and our assumption that $\lambda$ is a finite number. Let $G_t = a_t \nabla + a_t \delta, \nabla_n$. Let $(u, w)_r = (\Lambda u, \Lambda w)$. If $u, w$ are vector-valued or Clifford 1-vector-valued, we define $(u, w) = \int u \cdot w \, d\sigma \, d\beta$, and $(u, w)_r = (\Lambda u, \Lambda w)$. For $(u, u_t) \in \mathcal{S}(R^2) \times \mathcal{S}(R^2)$, $u, u_t$ scalar-valued or vector-valued, we define

\begin{align}
(6.23)
E_s(u, u_t) &= (u_t, u_t)_{s-1} + (\nabla u_t, \nabla u_t)_{s-1} + (G A s u, A s u) + (G A s u, A s \nabla u) \\
&\quad + \epsilon^2 ([u_t, u_t]_{s-1} + (u_t, u_t)_{s-1} + (\nabla u_t, \nabla u_t)_{s-1} + (\nabla u_t, \nabla u_t)_{s-1}),
\end{align}

\begin{align}
E_s(u, u_t) &= (u_t, u_t)_{s-1} + (\nabla u_t, \nabla u_t)_{s-1} + (G A s u, A s u) + (G A s u, A s \nabla u),
\end{align}

\begin{align}
|u, u_t|_s^2 &= \|u\|_{s+1/2}^2 + \|u_t\|_{s}^2.
\end{align}

From Corollary 6.5 and Lemma 6.9, we know that

\begin{equation}
\kappa^{-1} |(u, u_t)|_s^2 \leq E_s(u, u_t) \leq \kappa |(u, u_t)|_s^2
\end{equation}

where $\kappa = \kappa(C_0, c_0, \mu, M(s + 1/2), M_1, M_2) > 1$ is a constant, and

\begin{align}
\sup_{0 \leq s \leq T} (\|\xi_\alpha - \epsilon_\alpha\|_{s-\frac{1}{2}} + \|\xi_\beta - \epsilon_\beta\|_{s-\frac{1}{2}}) \leq M(s + \frac{1}{2}),
\end{align}

\begin{align}
\sup_{0 \leq s \leq T} \|I + \kappa^*\| \leq M_1, \quad \sup_{0 \leq s \leq T} \|a - 1\|_1 \leq M_2.
\end{align}

In this part, we solve the initial value problem of the linear system

\begin{align}
(6.25)
&u_{tt} + a \nabla u = g, \quad 0 \leq t \leq T, \\
&u(\cdot, 0) = u_0, \quad u_t(\cdot, 0) = u_1.
\end{align}

We assume that $a$ and $g$ are scalar-valued, so we are only concerned with a scalar equation. The approach here is very much the same as for the 2-D case [24]. We only give the main steps and present in detail those proofs which have major differences from the 2-D case.

As in the 2-D case, we first consider the linear systems:

\begin{align}
(6.26)
&u_{tt} + a \nabla u - \epsilon^2 \Delta u = g, \quad 0 \leq t \leq T, \\
&u(\cdot, 0) = u_0, \quad u_t(\cdot, 0) = u_1
\end{align}

where $\Delta = \partial^2 + \partial^2$. Let

\begin{align}
H^{2n}: \xi_\alpha - \epsilon_\alpha, \quad \xi_\beta - \epsilon_\beta \in C^1([0, T], H^s(R^2, C(V_3))), \quad e_\alpha \times e_\beta = e_3, \quad \xi_t \in C([0, T], H^{s+1/2}(R^2, C(V_3))).
\end{align}

Lemma 6.13. Let $0 < \epsilon < 1, 0 < T < \infty, s \geq 3/2 + q, a - 1 \in C([0, T], H^s(R^2))$, and $g \in C([0, T], H^s(R^2))$. Assume that $\Sigma(t), t \in [0, T]$, satisfies H1, H2n and H3.

a. If $u_0 \in H^{s+1}, u_1 \in H^s$, then there exists a unique solution $u$ of $(6.26e)$, such that $u \in C^1([0, T], H^{s+1/2}(R^2, C(V_3)))$.

b. Assume further that $a_t \in C([0, T], H^{s+1/2}(R^2))$, and $a \geq c_0$, for some constant $c_0 > 0$. If $u \in C^1([0, T], H^{s+1/2}(R^2)), j = 0, 1, 2$, is a solution of $(6.26e)$, then $u$
satisfies the estimate

$$E_{s_1}(u, u_t) \leq e^{\varepsilon t} E_{s_1}(u_0, u_1) + \int_0^t e^{(t-\tau)} \|g\|^2 d\tau$$

for $0 \leq t \leq T$, where $c = c(C_0, C_0, \mu, M(s + 1), M_1, M_2(s), M_3, M_4(s + 1/2))$ is a constant, and

$$\sup_{0 \leq t \leq T} \|\xi_\alpha - c_1 \|_s + \|\xi_\beta - c_2 \|_s \leq M(s + 1),$$

$$\sup_{0 \leq t \leq T} \|\alpha - 1 \|_s \leq M_2(s),$$

$$\sup_{0 \leq t \leq T} \|u_t\|_{1+q} \leq M_3,$$

$$\sup_{0 \leq t \leq T} \|\xi_t\|_{s+1/2} \leq M_4(s + 1/2),$$

$M_1$ is as defined in (6.24).

**Proof.** a. can be proved in the same way as [24, Lemma 5.7 a]. We omit the proof. We prove (6.27) in detail for $u \in C^j([0, T], H^{s+2-j})$, $j = 0, 1, 2$. For $u \in C^j([0, T], H^{2+1-j})$, $j = 0, 1, 2$, as stated in this lemma, we can obtain (6.27) as we did in [24] through an approximation argument.

Let $a = \frac{a}{\|\xi_\alpha \times \xi_\beta\|}$, so $\|a - 1\|_s \leq c_1 \|a - 1\|_r$, for $1 + q \leq r \leq s - 1/2$, where $c_1 = c_1(\mu, \|\xi_\alpha - c_1 \|_r, \|\xi_\beta - c_2 \|_r)$. Let $u \in C^j([0, T], H^{s+1-j})$, $j = 0, 1, 2$, be a solution of (6.26e). We have

$$\frac{d}{dt} E_{s_1}(u, u_t) = 2(u_{tt}, u_t)_{s-1} + 2(\nabla_n u_{tt}, \nabla_n u_t)_{s-1} + 2(\partial_t, \nabla_n u_t, \nabla_n u_t)_{s-1} + (GA^{s-1}u, \Lambda^{s-1}u) + (GA^{s-1}u_t, \Lambda^{s-1}u)$$

$$+ (GA^{s-1}u_t, \Lambda^{s-1}u_t) + (GA^{s-1}u_{tt}, \Lambda^{s-1}u_{tt}) + (GA^{s-1}u_{tt}, \Lambda^{s-1}u_{tt})$$

$$+ (GA^{s-1}u_{tt}, \Lambda^{s-1}u_{tt}) + (GA^{s-1}u_{tt}, \Lambda^{s-1}u_{tt}) + (GA^{s-1}u_{tt}, \Lambda^{s-1}u_{tt})$$

$$+ 2c^2(u_{tt}, u_t)_{s-1} + 2c^2(u_{tt}, u_{t2})_{s-1} + 2c^2(\nabla_n u_{tt}, \nabla_n u_t)_{s-1}$$

$$+ 2c^2(\nabla_n u_{tt}, \nabla_n u_{t2})_{s-1} + 2c^2(\partial_t, \nabla_n u_{t2}, \nabla_n u_{tt})_{s-1}$$

$$= I_1 + I_2 + I_3 + I_4 + I_5$$

where

$$I_1 = 2(u_{tt}, u_t)_{s-1} + (GA^{s-1}u, \Lambda^{s-1}u) + (GA^{s-1}u_t, \Lambda^{s-1}u)$$

$$I_2 = 2(\nabla_n u_{tt}, \nabla_n u_t)_{s-1} + (GA^{s-1}u_t, \Lambda^{s-1}u) + (GA^{s-1}u_{tt}, \Lambda^{s-1}u_{tt})$$

$$I_3 = 2(\partial_t, \nabla_n u_{tt}, \nabla_n u_{tt})_{s-1} + 2c^2(\partial_t, \nabla_n u_{t2}, \nabla_n u_{tt})_{s-1}$$

$$I_4 = (GA^{s-1}u_{tt}, \Lambda^{s-1}u) + (GA^{s-1}u_{tt}, \Lambda^{s-1}u)$$

$$I_5 = (GA^{s-1}u_{tt}, \Lambda^{s-1}u) + (GA^{s-1}u_{tt}, \Lambda^{s-1}u)$$

From Lemmas 3.1, 3.2, 6.2 and 6.4, we know

$$\|\partial_t, \nabla_n u\|_{r-1} \leq k^r(\|\xi_\alpha\|_{r-1} + \|\xi_\beta\|_{r-1}) + k^r_\alpha \|\xi_t\|_{s-1} \|u_t\|_s$$

for $r = s, s + 1/2$, where $k^r = k^r(C_0, \mu, M(r), M_1)$, and sup$_{0 \leq t \leq T}(\|\xi_\alpha\|_{r-1} + \|\xi_\beta\|_{r-1}) \leq M_4(r), r = s, s + 1/2$. Therefore using Corollary 6.5, we get

$$|I_3| \leq k^r_\alpha \|\xi_t\|_{s}(\|u_t\|_{1+q} + \|u_t\|_s + \|\xi_\alpha\|_s^2 + \|\xi_\beta\|_s^2) + k^r_\alpha \|\xi_t\|_{s-1} \|u_t\|_s^2$$
and using Lemma 6.6 a, Corollary 6.5, Lemma 6.7 and (6.29), we have

\[ |I_4| \leq \int_{\Sigma(t)} \{ a(\Lambda^{s-1}\nabla_n u) \nabla_n(\Lambda^{s-1}[\partial_t, \nabla_n]u) \]
\[ + a(\Lambda^{s-1}[\partial_t, \nabla_n]u) \nabla_n(\Lambda^{s-1}\nabla_n u) \} \, dS \]
\[ + 2\lambda(\Lambda^{s-1}[\partial_t, \nabla_n]u, \Lambda^{s-1}\nabla_n u) \]
\[ \leq k^{s+1/2}_t(||a-1||_{1+q}+1)(||\xi_t||_{s-1/2}||u_s||_{s+1/2}^2 + ||\xi_t||_{s+1/2}||u||_{1+q}||u||_{s+1/2}). \]

Since

\[ I_5 = \int_{\Sigma(t)} \frac{a_t}{\xi_\alpha \times \xi_\beta} (\Lambda^{s-1} u) \nabla_n(\Lambda^{s-1} u) \, dS \]
\[ + \int_{\Sigma(t)} \frac{a_t}{\xi_\alpha \times \xi_\beta} (\Lambda^{s-1} \nabla_n u) \nabla_n(\Lambda^{s-1} \nabla_n u) \, dS \]
\[ + \int_{\Sigma(t)} a([\partial_t, \nabla_n] \Lambda^{s-1} u)(\Lambda^{s-1} u) \, dS + \int_{\Sigma(t)} a([\partial_t, \nabla_n] \Lambda^{s-1} \nabla_n u)(\Lambda^{s-1} \nabla_n u) \, dS, \]

we have from Lemma 6.6 a, Corollary 6.5, Lemma 6.7 and 6.8 that

\[ |I_5| \leq k^{s+1/2}_t(||a||_{1+q}+1)||u||_{s+1/2}^2 + k^{s+1/2}_t(||a-1||_{1+q}+1)||\xi_t||_{2+q}||u||_{s+1/2}. \]

We remark that the constants $k^r_t, r = s, s + 1/2, s + 1$, in (6.29)-(6.32) and in the following are not the same, but depend on the same factors.

We now estimate $I_2$. Since $u$ is a solution of (6.26), we have

\[ I_2 = 2(\nabla_n(-a \nabla_n u), \nabla_n u_s)_{s-1} + 2(\nabla_n g, \nabla_n u_t)_{s-1} + (a \nabla_n \Lambda^{s-1} \nabla_n u, \Lambda^{s-1} \nabla_n u_t) \]
\[ + (a \nabla_n \Lambda^{s-1} \nabla_n u_t, \Lambda^{s-1} \nabla_n u) + 2\lambda(\Lambda^{s-1} \nabla_n u_t, \Lambda^{s-1} \nabla_n u) \]
\[ + 2\epsilon^2(\nabla_n, [\partial_\alpha, \nabla_n] u_t, \nabla_n u_{\alpha})_{s-1} + 2\epsilon^2(\nabla_n, [\partial_\beta, \nabla_n] u_t, \nabla_n u_{\beta})_{s-1} \]
\[ - 2\epsilon^2(\nabla_n u_t, [\partial_\alpha, \nabla_n] u_{\alpha})_{s-1} - 2\epsilon^2(\nabla_n u_t, [\partial_\beta, \nabla_n] u_{\beta})_{s-1}, \]
\[ = 2(-\Lambda^{s-1} \nabla_n(a \nabla_n u) + a \nabla_n \Lambda^{s-1} \nabla_n u, \Lambda^{s-1} \nabla_n u_t) + I'_2, \]

where

\[ I'_2 = \int_{\Sigma(t)} [a, \nabla_n](\Lambda^{s-1} \nabla_n u_t)(\Lambda^{s-1} \nabla_n u) \, dS + 2\lambda(\Lambda^{s-1} \nabla_n u_t, \Lambda^{s-1} \nabla_n u) \]
\[ + 2(\nabla_n g, \nabla_n u_t)_{s-1} + 2\epsilon^2(\nabla_n, [\partial_\alpha, \nabla_n] u_t, \nabla_n u_{\alpha})_{s-1} + 2\epsilon^2(\nabla_n, [\partial_\beta, \nabla_n] u_t, \nabla_n u_{\beta})_{s-1} \]
\[ - 2\epsilon^2(\nabla_n u_t, [\partial_\alpha, \nabla_n] u_{\alpha})_{s-1} - 2\epsilon^2(\nabla_n u_t, [\partial_\beta, \nabla_n] u_{\beta})_{s-1}. \]

We know from Lemma 6.6 c, Corollary 6.5, and Lemmas 6.7, 6.4 and 3.2, that

\[ |I'_2| \leq k^{s+1/2}_t(||a-1||_{1+q}+1)||u_t||_{s+1/2}||u||_{s+1/2} + k^{s+1/2}_t ||g||_s ||u_t||_s \]
\[ + 2\epsilon^2 k^{s+1/2}_t ||u_{\alpha}||_s ||u_{\beta}||_s \]
\[ \leq k^{s+1/2}_t(||a-1||_{1+q}+1)||u_t||_{s+2}^2 + ||u||_{s+1/2}^2 + k^{s+1/2}_t ||u_t||_{s+2}^2 \]
\[ + ||g||_s^2 + \epsilon^2 k^{s+1/2}_t ||u_{\alpha}||_s^2 + ||u_{\beta}||_s^2, \]
where \( k'_{s+1} = k'_{s+1}(C_0, \mu, M(s+1), M_1) \). On the other hand,
\[
-\Lambda^{s-1}\nabla_n(a\nabla_n u) + a\nabla_n \Lambda^{s-1}\nabla_n u = -[\Lambda^{s-1}, \nabla_n](a\nabla_n u) + \nabla_n[a, \Lambda^{s-1}]\nabla_n u + [a, \nabla_n]\Lambda^{s-1}\nabla_n u.
\]

From a similar argument as in Lemma 6.4, we have
\[
\| [\Lambda^{s-1}, \nabla_n](a\nabla_n u) \| \leq k'_{s+1/2}(\| a - 1 \|_{1+q} + 1)\| u \|_s + \| a - 1 \|_{s-1}\| u \|_{1+q})
\]
while from Lemma 6.2 and Corollary 6.5,
\[
\| \nabla_n[a, \Lambda^{s-1}]\nabla_n u \| \leq k'_{s+1/2}(\| a - 1 \|_{1+q} \| u \|_s + \| a - 1 \|_s\| u \|_{1+q}).
\]

Therefore
\[
\| (-\Lambda^{s-1}\nabla_n(a\nabla_n u) + a\nabla_n \Lambda^{s-1}\nabla_n u, \Lambda^{s-1}\nabla_n u_t) \|
\leq k'_{s+1/2}((\| a - 1 \|_{1+q} + 1)\| u \|_s + \| a - 1 \|_s\| u \|_{1+q})|u_t|_s
+ |(a, \nabla_n)\Lambda^{s-1}\nabla_n u, \Lambda^{s-1}\nabla_n u_t|)
\leq k'_{s+1/2}(\| a - 1 \|_{1+q} + 1)\| u \|_{s+1/2} + \| a - 1 \|_s\| u \|_{1+q})|u_t|_s
\]
where in the last inequality we used Lemma 6.6 c. Combining (6.33) and (6.34), we get
\[
|I_2| \leq k'_{s+1/2}(\| a - 1 \|_{1+q} + 1)(\| u \|_s^2 + \| u \|_{s+1/2}^2) + k'_{s+1/2}\| a - 1 \|_s\| u \|_{1+q})|u_t|_s
+ \| g \|_s^2 + c \| u \|_{s-1}^2 + \| u \|_{s-1}^2
\]
Finally using a similar but much easier argument we have that
\[
|I_1| \leq k'_{s+1/2}(\| a - 1 \|_{1+q} + 1)(\| u \|_s^2 + \| u \|_{s-1}^2)
+ k'_{s+1/2}\| a - 1 \|_{s-1}\| u \|_{1+q})|u_t|_{s-1} + \| g \|_{s-1}^2
\]
Combining (6.28) and (6.30)-(6.36), we obtain
\[
\frac{d}{dt}E_{s,c}(u, u_t) \leq c'\| u \|_s^2 + \| u \|_{s+1/2}^2 + c^2\| u \|_s^2 + \| u \|_{s-1}^2 + \| u \|_{s+1/2}^2 + \| u \|_{s-1}^2 + \| g \|_s^2
\]
where
\[
c = c(C_0, c_0, \mu, M(s+1), M_1, \sup_{0 \leq t \leq T} \| a - 1 \|_s, \sup_{0 \leq t \leq T} \| a \|_{1+q}, \sup_{0 \leq t \leq T} \| \xi \|_{s+1/2}),
\]
and \( c' \) depends on the same factors as \( c \). Therefore
\[
E_{s,c}(u, u_t) \leq e^{ct}E_{s,c}(u_0, u_1) + \int_0^t e^{c(t-\tau)}\| g \|_s^2 d\tau.
\]
This proves (6.27) for \( u \in C^j([0, T], H^{s+2-j}), j = 0, 1, 2 \). For \( u \in C^j([0, T], H^{s+1-j}), j = 0, 1, 2 \), (6.27) is obtained through an approximation argument.

Taking \( c = 0 \) in the above proof, we get the following estimates for solutions of (6.25).

**Lemma 6.14.** Let \( 0 < T < \infty, s \geq 3/2 + q, a - 1 \in C([0, T], H^s(R^2)), and g \in C([0, T], H^s(R^2)). Assume that \( \Sigma(t), t \in [0, T], satisfies H1, H2 and H3, and**
also that $a_t \in C([0, T], H^{1+q}(R^2))$, $a \geq c_0$, for some constant $c_0 > 0$. If $u \in C^j([0, T], H^{s+1/2-j/2}(R^2))$, $j = 0, 1, 2$, satisfies (6.25), then

\begin{equation}
(u(t), u_t(t))_s^2 \leq \kappa^2 e^{d_1 t} |(u_0, u_1)|_s^2 + \kappa \int_0^t e^{d_1 (t-\tau)} \|g(\tau)\|_s^2 \, d\tau;
\end{equation}

if further $s \geq 2 + q$, then

\begin{equation}
(u(t), u_t(t))_s^2 \leq \kappa^2 e^{d_2 t} |(u_0, u_1)|_s^2 + \kappa \int_0^t e^{d_2 (t-\tau)} (\|a - 1\|_s^2 + \|\xi\|_{s+1/2}^2 + \|g(\tau)\|_s^2) \, d\tau,
\end{equation}

where $\kappa$ is as in (6.24),

\begin{align*}
&d_1 = d_1(C_0, c_0, \mu, M(s + 1/2), M_1, M_2(s), M_3, M_4(s + 1/2)), \\
&d_2 = d_2(C_0, c_0, \mu, M(s + 1/2), M_1, M_2(s), M_3, M_4(s), \sup_{0 \leq t \leq T} \|u\|_{1+q})
\end{align*}

are constants, $M_1, M_2, M_3, M_4(s + 1/2), M_2(s), M_4(s + 1/2)$ are as in (6.24) and Lemma 6.13, and $\sup_{0 \leq t \leq T} \|\xi\|_s \leq M_4(s)$.

As in the 2-D case [24], we need the following result to guarantee that when passing to limits, we will get solutions with the desired regularity.

**Lemma 6.15.** Let $0 < T < \infty$, $s \geq 3/2 + q$, $a - 1 \in L^{\infty}([0, T], H^s)$, $g \in L^{\infty}([0, T], H^s)$, and $a - 1, a_t \in C([0, T], H^{1+q})$. Assume that $\Sigma(t), t \in [0, T]$, satisfies $H1, H2'$ and $H3$, and $a \geq c_0$ for some constant $c_0 > 0$. If $(u, u_t) \in L^{\infty}([0, T], H^{s+1/2} \times H^s) \cap C([0, T], H^{s+1/2} \times H^s)$, $s' < s$, satisfies (6.25), then $(u, u_t) \in C([0, T], H^{s+1/2} \times H^s)$.

**Proof.** The proof of Lemma 6.15 is very similar to that of [24, Lemma 5.9], except that in this proof, we need to apply Lemma 6.11 to $\Sigma_1(t) = \Sigma(t)$ and $\Sigma_2(t) = \Sigma(t + t')$, as $t' \to 0$. We omit the details. \hfill $\Box$

Finally we have the following well-posedness result for the linear system (6.25).

**Theorem 6.16.** Let $0 < T < \infty$, $s \geq 5/2 + q$, $a - 1 \in C([0, T], H^{s+2}(R^2))$, $a_0 \in C([0, T], H^{s+1+q}(R^2))$ and $g \in C([0, T], H^s(R^2))$. Assume that $\Sigma(t), t \in [0, T]$, satisfies $H1, H2^\prime$ and $H3$, and $a \geq c_0$ for some constant $c_0 > 0$. If $(u_0, u_t) \in H^{s+1/2} \times H^s$, then there is a unique solution $u$ of the linear system (6.25), such that $u \in C([0, T], H^{s+1/2-j/2}(R^2))$, $j = 0, 1, 2$.

**Proof.** The uniqueness of solutions is a consequence of Lemma 6.14. The proof of existence has two steps and is again very similar to that of [24, Theorem 5.10]. In Step 1, we assume further that $\Sigma(t)$ satisfies $H2''$ and $u_0 \in H^{s+1}$, and we obtain the solution of (6.25) by taking the limit of solutions of (6.26c) as $\epsilon \to 0$. We use estimates (6.27) and (6.37) to show that the limit exists. We use Lemma 6.15 to ensure that the solution has the desired regularity.

In Step 2, we remove the further assumption made in Step 1 by smoothing $u_0$ and $\Sigma(t)$, then pass to the limit. The smoothing can be done as usual, that is, taking $\Sigma_0(t) = \xi(t) * \phi_0$ and $u_0, \delta = u_0 * \phi_\delta$, where $\phi(\alpha, \beta) = \frac{1}{\delta^2} \phi(\frac{\alpha}{\delta}, \frac{\beta}{\delta})$, $\phi \in \mathcal{S}(R^2)$, $\int \phi = 1$. It is not hard to see that $\Sigma_\delta(t)$ satisfies $H2''$ and $u_0, \delta \in H^{s+1}$.

We verify in the following that $\Sigma_\delta(t)$ also satisfies $H1$ and $H3$, when $\delta \leq \delta_0$, where $\delta_0 > 0$ is a constant.
Let \((\alpha', \beta') = (\alpha, \beta) + (\alpha_1, \beta_1)\). Since

\[
(\xi_\delta(\alpha', \beta') - \xi_\delta(\alpha, \beta)) - (\xi(\alpha', \beta') - \xi(\alpha, \beta))
\]

\[
= \int_0^1 \frac{d}{d\theta} \{(\xi_\delta - \xi)(\alpha + \theta \alpha_1, \beta + \theta \beta_1)\} \, d\theta
\]

\[
= \int_0^1 (\nabla \xi_\delta - \nabla \xi)(\alpha + \theta \alpha_1, \beta + \theta \beta_1) \cdot (\alpha_1, \beta_1) \, d\theta,
\]

and since

\[
|\nabla \xi - \nabla \xi|_\infty \leq \delta C(\|\xi_\delta - e_\alpha\|_{1+q} + \|\xi_\delta - e_\beta\|_{1+q}) \leq \delta CM,
\]

we have

\[
|\xi_\delta(\alpha', \beta') - \xi_\delta(\alpha, \beta)| \geq |\xi(\alpha', \beta') - \xi(\alpha, \beta)| - \delta C M (|\alpha_1| + |\beta_1|)
\]

\[
\geq (C_0 - \delta CM) (|\alpha - \alpha'| + |\beta - \beta'|)
\]

where \(C\) is a universal constant, \(\|\xi_\delta - e_\alpha\|_{1+q} + \|\xi_\delta - e_\beta\|_{1+q} \leq M\). Consequently

\[
|\xi_\delta(\alpha', \beta') - \xi_\delta(\alpha, \beta)| \geq \frac{C_0}{2} (|\alpha - \alpha'| + |\beta - \beta'|)
\]

for \(0 < \delta \leq \frac{C_0}{2CM}\). The fact that \(\xi_\delta\), for \(\delta \leq \delta_0\), satisfies H3 can be verified similarly. The rest of proof is carried out similar to that of [24, Theorem 5.10].

It is clear that Lemmas 6.14 and 6.15 and Theorem 6.16 also hold if \(g, u_0, u_1\) and the solution \(u\) are vector-valued or Clifford 1-vector-valued.

**The quasilinear system.** Let \(g(\xi, u, u_t) = -\tilde{n}(I + \tilde{K}^*)^{-1}(\mathcal{R}\{\tilde{n} f(\xi, u, u_t)\})\), where \(f = f(\xi, u, u_t), \tilde{n}\) are as defined in (5.22) and \(\tilde{K}^*\) is as defined in (5.23). The following estimates of \(g\) and \(a\) are easy consequences of results in the estimates part.

**Lemma 6.17.** Let \(0 < T < \infty, s \geq 3/2 + q\). Assume that for \(t \in [0, T]\), \(\Sigma(t): \xi = \xi(\alpha, \beta, t)\) satisfies H1, H2 and H3, and \((I + \tilde{K}^*)^{-1}\) is bounded from \(L_2(R^2)\) to \(L_2(R^2)\); assume further that \(u, u_t \in C([0, T], H^s(R^2, C(V_3)))\), and \(|u_t + e_3| \geq c_0\), for some constant \(c_0 > 0\). Then

a. \(g = g(\xi, u, u_t) \in C([0, T], H^s(R^2, C(V_3)))\), and

\[
\|g\|_s \leq K_g(C_0, c_0, \mu, M(s), \tilde{M}_1, M(s), M_t(s)),
\]

where \(K_g = K_g(C_0, c_0, \mu, M(s), \tilde{M}_1, M(s), M_t(s))\) is a constant,

\[
\sup_{0 \leq t \leq T} \|(\xi_\alpha - e_\alpha)|_{s-1} + \|(\xi_\beta - e_\beta)|_{s-1}\| \leq M(s), \quad \sup_{0 \leq t \leq T} \|(I + \tilde{K}^*)^{-1}\| \leq \tilde{M}_1,
\]

b. \(a - 1 = |u_t + e_3| - 1 \in C([0, T], H^s(R^2))\), and

\[
\|a - 1\|_s \leq K_a(M_t(r)), \quad \text{for } 1 + q \leq r \leq s,
\]

where \(K_a = K_a(M_t(r))\) is a constant, \(\sup_{0 \leq t \leq T}\|u_t\|_r \leq M_t(r)\).

c. Assume further that \(u_{tt} \in C([0, T], H^{1+q}(R^2, C(V_3)))\). Then

\[
a_t \in C([0, T], H^{1+q}(R^2)),
\]
Assume that \( f \) further that each term in \( K \) where \( (6.39) \)
\[
K_t(1 + q), M_t) \text{ is as defined in } b.
\]

**Proof.** a. and c. are easy consequences of Lemmas 6.1 and 6.2.

Notice that \( \hat{n} = \frac{u_t + e_3}{|u_t + e_3|} \in C([0, T], H^s(R^2, C(V_3))). \) From the same proof for Lemma 6.4, we have \((I + \tilde{K}^*)^{-1}\) is bounded from \(H^s(R^2)\) to \(H^s(R^2).\) Notice further that each term in \( f(\xi, u, u_t) \) is an operator of one of the types discussed in Lemma 6.4, with \( a, b = u \) or \( u_t, \) therefore we have a.

The following result is a consequence of Lemmas 6.4 and 6.10.

**Lemma 6.10.** Let \( s \geq 3/2 + q. \) For \( t \in [0, T] \) and \( 0 \leq \vartheta \leq 1, \) let
\[
\Sigma(\vartheta ; t) : \xi = \xi^1(\alpha, \beta, t), \quad \Sigma_2(t) : \xi = \xi^2(\alpha, \beta, t),
\]
\[
\Sigma(\vartheta ; t) : \xi = \vartheta \xi^1(\alpha, \beta, t) + (1 - \vartheta)\xi^2(\alpha, \beta, t).
\]
Assume that \( \Sigma(\vartheta ; t) \) satisfies H1, H2, and H3, for all \( t \in [0, T], \) \( 0 \leq \vartheta \leq 1, \) with the same bounds \( C_0, \mu \) and
\[
\sup_{0 \leq \vartheta \leq 1, 0 \leq t \leq T} (\|\xi_\alpha - e_\alpha\|_{s-1} + \|\xi_\beta - e_\beta\|_{s-1}) \leq M(s) < \infty,
\]
and assume that \((I + \tilde{K}^*)^{-1}\) is bounded from \(L_2(R^2)\) to \(L_2(R^2),\) with
\[
\sup_{0 \leq \vartheta \leq 1, 0 \leq t \leq T} \|\| (I + \tilde{K}^*)^{-1}\| \leq \tilde{M_1} < \infty,
\]
where \( \| (I + \tilde{K}^*)^{-1}\| \) is the operator norm of \((I + \tilde{K}^*)^{-1}\) from \(L_2(R^2)\) to \(L_2(R^2).\)

Assume further that for \( i = 1, 2, u^i, u^i_t \in C([0, T], H^s(R^2, C(V_3))), \) with
\[
\sup_{0 \leq t \leq T} \|u^i\|_s \leq M(s) \quad \text{and} \quad \sup_{0 \leq t \leq T} \|u^i_t\|_s \leq M_t(s), \quad i = 1, 2,
\]
and \( |u^i_\vartheta + e_3| \geq c_0, \) for some constant \( c_0 > 0. \) Then
\[
(6.39) \quad \|g(\xi^1, u^1, u^1_t) - g(\xi^2, u^2, u^2_t)\|_s \leq K_g(\|\xi^1 - \xi^2\|_s + \|u^1 - u^2\|_s + \|u^1_t - u^2_t\|_s),
\]
\[
\|a(u^1) - a(u^2)\|_s \leq K_a \|u^1 - u^2\|_s
\]
where \( K_g = K_g(C_0, c_0, \mu, M(s), \tilde{M_1}, M(s), M_t(s)) \) and \( K_a = K_a(M_t(s)) \) are constants.

Now we are ready to solve the initial value problem of the quasilinear system (5.21)-(5.23), (5.29).

Let \( \Sigma(0) : \xi = \xi_0(\alpha, \beta) \) be a surface that divides \( R^3 \) into two simply connected regions. Assume that there are vectors \( e_\alpha, e_\beta, \) such that \( e_\alpha \times e_\beta = e_3, \xi_0, e_\alpha - e_\beta \in H^{s-1/2}(R^2, C(V_3)), \)
\[
|\xi_0 \times e_\beta| \geq 2\mu, \quad \text{for } -\infty < \alpha, \beta < \infty,
\]
\[
(6.40) \quad |\xi_0(\alpha, \beta) - \xi_0(\alpha', \beta')| \geq 2C_0(|\alpha - \alpha'| + |\beta - \beta'|) \quad \text{for } -\infty < \alpha, \beta < \infty.
\]
Assume \( \xi_0, \xi_1 \) satisfy (5.30). Therefore \( \hat{n}(0) = n_0 \) and \( \tilde{K}^*(0) = K_0. \) Let
\[
(6.41) \quad M_0 = \|\xi_0 - e_\alpha\|_{s-1/2} + \|\xi_0 - e_\beta\|_{s-1/2} \quad \text{and} \quad M_{0,1} = \|(I + K_0^*)^{-1}\|.
\]
Theorem 6.19. Let $s \geq 5/2+q$, where $q > 1$. Assume that $u_0 \in H^{s+1/2}(R^2, \mathcal{C}(V_3))$, $u_1 \in H^s(R^2, \mathcal{C}(V_3))$, and $a_0 = |u_1 + e_3| \geq 2c_0$ for some constant $c_0 > 0$. Then there exists $T > 0$,

$$T = T(C_0, c_0, \mu, M_0, M_{0,1}, M_0),$$

where $M_0^2 = ||u_0||^2_{s+1/2} + ||u_1||^2_s$, such that the system (5.21)-(5.23), (5.29) has a unique solution $u \in C^2([0, T], H^{s+1/2-j/2}(R^2, \mathcal{C}(V_3)))$, $j = 0, 1, 2$. Moreover, the surfaces

$$\Sigma(t) : \xi(t) = \xi_0 + \int_0^t u(\tau) \, d\tau, \quad t \in [0, T],$$

satisfy $H1-H3$.

Remark 1. In this theorem, the assumption that $u_0, u_1$ satisfy (5.30) is not necessary. The result holds for general $u_0$ and $u_1$, if we assume further that $(I + \tilde{K}^*(0))^{-1}$ is bounded from $L_2(R^2)$ to $L_2(R^2)$. In this case, the existence time $T$ also depends on the operator norm of $(I + \tilde{K}^*(0))^{-1}$.

Remark 2. The assumption $u_1 \in H^s$ is a consequence of $n_0 - e_3 \in H^s$ and the regularity assumptions on $\xi_0$, $u_0$ given in this theorem.

Proof. Existence: We prove the existence by the iteration method.

Let $0 < T < \infty$; we define a set $S_T \subset \bigcap_j C^2((0, T], H^{s+1/2-j/2}(R^2, \mathcal{C}(V_3)))$ by

$$S_T = \{ u \bigg| \sup_{0 \leq \tau \leq T} (||u||^2_{s+1/2} + ||u_t||^2_s) \leq 4M_0^2, \inf_{0 \leq \tau \leq T} a = \inf_{0 \leq \tau \leq T} |u_t + e_3| \geq c_0 \}$$

(6.42)

where $\kappa_0 = \kappa(C_0, c_0, \mu, 2M_0, 2M_{0,1}, K_0(2M_0))$ is the constant defined in (6.24) and $K_0(2M_0)$ is the constant in Lemma 6.17b. For

$$\xi(t) = \xi_0 + \int_0^t u(\tau) \, d\tau,$$

where $u \in S_{T_0}$, for some $T_0 > 0$. Since

$$|\xi_0 \times \xi_\beta| \geq |\xi_0 \times \xi_{0,\beta}| - |(\int_0^t u_\alpha(\tau) \, d\tau) \times \xi_{0,\beta}|$$

$$- |\xi_0,\alpha \times (\int_0^t u_\beta(\tau) \, d\tau)| - |(\int_0^t u_\alpha(\tau) \, d\tau) \times (\int_0^t u_\beta(\tau) \, d\tau)|,$$

$$|\xi(\alpha, \beta, t) - \xi(\alpha', \beta', t)| \geq |\xi_0(\alpha, \beta) - \xi_0(\alpha', \beta')| - \int_0^t |u(\alpha, \beta, \tau) - u(\alpha', \beta', \tau)| \, d\tau,$$

$$||\xi_0 - e_\alpha||_{s-\frac{1}{2}} + ||\xi_\beta - e_\beta||_{s-\frac{1}{2}} \leq ||\xi_0 - e_\alpha||_{s-\frac{1}{2}} + ||\xi_0 - e_\beta||_{s-\frac{1}{2}}$$

$$+ \int_0^t (||u_\alpha(\tau)||_{s-\frac{1}{2}} + ||u_\beta(\tau)||_{s-\frac{1}{2}}) \, d\tau,$$

$$\tilde{K}^* = K_0^* + \int_0^t [\partial_\tau, \tilde{K}^*] \, d\tau, \quad K^* = K_0^* + \int_0^t [\partial_\tau, K^*] \, d\tau,$$
from Lemmas 6.1, 6.2 and 6.4, we know that there exists a
\[ T_1 = T_1(C_0, \mu, M_0, M_{0.1}, 2\kappa_0^2M_0^2), \quad 0 < T_1 \leq T_0, \]
such that
\[
\begin{align*}
\inf_{0 \leq t \leq T_1} |\xi_\alpha \times \xi_\beta| & \geq \mu, \\
\inf_{0 \leq t \leq T_1} |\xi(\alpha, \beta, t) - \xi(\alpha', \beta', t)| & \geq C_0(|\alpha - \alpha'| + |\beta - \beta'|), \\
\sup_{0 \leq t \leq T_1} \|\xi_\alpha - \epsilon_\alpha\|_{s - \frac{1}{2}} + \|\xi_\beta - \epsilon_\beta\|_{s - \frac{1}{2}} & \leq 2M_0, \\
\sup_{0 \leq t \leq T_1} \|(I + \tilde{K}^*)^{-1}\| & \leq 2M_{0.1}, \quad \sup_{0 \leq t \leq T_1} \|(I + K^*)^{-1}\| & \leq 2M_{0.1}.
\end{align*}
\]

Step 1. We construct inductively a sequence \( w^i \in S_T \), where \( 0 < T \leq T_1 \) will be given later. First, we take \( u^0(t) \equiv u_0 \) and \( \xi^0(t) \equiv \xi_0 \). It is clear that \( u^0 \in S_T \), for any \( 0 < T < \infty \) and \( u^0\|_{t} = 0 \in C([0, T], H^{1+\eta}) \). Assume that we have obtained \( u^m \), \( 0 \leq m \leq j \), and \( u^m \in S_T \) for some \( 0 < T \leq T_1 \) and \( u^m \in C([0, T], H^{1+\eta}) \). We define \( a_0 = [u_1 + e_1], \ g_0 = g(\xi_0, u_0, u_1) \), and for \( 1 \leq m \leq j \), \( a_m = [u^m + e_m], \ \xi^m(t) = \xi_0 + \int_0^t u^m(\tau) d\tau \), and \( g_m = g(\xi^m, u^m, u^m) \). We know \( a_m \geq c_0 \), for \( 0 \leq m \leq j \). From Lemma 6.17, we have that \( a_m - 1 \in C([0, T], H^q(R^2)) \), \( g_m \in C([0, T], H^q(R^2, C(V_1))) \), and \( \partial_t a_m \in C([0, T], H^{1+\eta}) \). Therefore by Theorem 6.16, there is a unique \( u^{j+1} \in \bigcap_{j=0}^2 C([0, T], H^{s+1/2, -j/2}(R^2, C(V_1))) \), satisfying the following equation:
\[
\begin{align*}
\frac{d}{dt} u^{j+1} + a_j \nabla_{x_j} u^{j+1} &= g_j, \\
u^{j+1}(\cdot, 0) &= u_0, \quad u^{j+1}(\cdot, 0) = u_1,
\end{align*}
\]
where \( \nabla_{x_j} \) is the normal derivative with respect to the surface \( \xi^j(t) \) for fixed \( t \), \( 0 \leq t \leq T. \) We want to show that there is a \( 0 < T \leq T_1 \), such that \( u^m \in S_T \) for \( 0 \leq m \leq j \) implies \( u^{j+1} \in S_T \).

Assume that \( u^j \in S_T \), where \( 0 < T \leq T_1 \). From (6.43), Lemma 6.14 (6.37) and Lemma 6.17, we have
\[
\|(u^{j+1}(t), u^{j+1}_{tt}(t))\|^2 \leq \kappa_0^2 \int_0^t e^{\kappa_1(t-\tau)} \|g_j(\tau)\|^2 d\tau,
\]
where \( \kappa_0 = \kappa(C_0, c_0, \mu, 2M_0, 2M_{0.1}, K_a(2M_0)) \) is the constant in (6.42),
\[
d_1 = d_1(C_0, c_0, \mu, 2M_0, 2M_{0.1}, K_a(2\kappa_0M_0), K_{a_1}, 2\kappa_0M_0),
\]
is the constant defined in inequality (6.37), and \( K_{a_1} \) is the constant such that \( \sup_{0 \leq t \leq T} \|\partial_t a_j\|_{1+\eta} \leq K_{a_1} \). From Lemma 6.17 c, we know that
\[
K_{a_1} = K_a(2M_0, M_{tt}),
\]
where \( \sup_{0 \leq t \leq T} \|u_{tt}^j\|_{1+\eta} \leq M_{tt} \). Since from (6.44), \( u_{tt}^j = -a_{j-1} \nabla_{x_{j-1}} u^j + g_{j-1} \), therefore
\[
\sup_{0 \leq t \leq T} \|u_{tt}^j\|_{1+\eta} \leq M_{tt}(M_0, M_{0.1}, C_0, c_0, \mu, M_0)
\]
where \( M_{tt}(M_0, M_{0.1}, C_0, c_0, \mu, M_0) \) is a constant determined by \( M_0, M_{0.1}, C_0, c_0, \mu, M_0 \). So there exists a constant
\[
K_1 = K_1(C_0, c_0, \mu, M_0, M_{0.1}, M_0),
\]
Moreover we have from Lemma 6.17 and the induction hypothesis that
\begin{equation}
\sup_{0 \leq t \leq T, \tau} |(u^{j+1}(t), u_t^{j+1}(t))|^2_s \leq K_1.
\end{equation}
Since
\begin{equation}
|u^{j+1}(t)|^2_s + |u_t^{j+1}(t)|^2_{s-1/2} \leq 2|u_0|^2_s + 2|u_1|^2_{s-1/2} + 2 \int_0^t (|u_t^{j+1}(\tau)|^2_s + |u_t^{j+1}(\tau)|^2_{s-1/2}) d\tau
\end{equation}
for \( t \leq 1 \) and from (6.44), Lemma 6.17, and the induction hypothesis, there is a constant
\begin{equation}
K_2 = K_2(C_0, c_0, \mu, 2M_0, 2M_{0,1}, K_{\alpha}(2\kappa_0M_0), 2\kappa_0M_0),
\end{equation}
such that
\begin{equation}
|u_t^{j+1}(\tau)|^2_s + |u_t^{j+1}(\tau)|^2_{s-1/2} \leq K_2(|u^{j+1}(\tau), u_t^{j+1}(\tau)|^2_s + 1),
\end{equation}
it follows that for all \( 0 < T \leq \min\{T_1, T_2, 1\} \), where \( T_2 = \frac{M_0^2}{(K_1 + 1)K_2} \), we have
\begin{equation}
\sup_{0 \leq t \leq T} (|u^{j+1}(t)|^2_s + |u_t^{j+1}(t)|^2_{s-1/2}) \leq 2M_0^2 + TK_2(K_1 + 1) \leq 4M_0^2.
\end{equation}
Now assume that \( 0 < T \leq \min\{T_1, T_2, 1\} \). From the induction hypothesis, Lemma 6.14 (6.38), Lemma 6.17 and (6.43), we also have that
\begin{equation}
|(u^{j+1}(t), u_t^{j+1}(t))|^2_s \leq \kappa_0^2 e^{d_2 t} |(u_0, u_1)|^2_s
\end{equation}
(6.48)\[ \quad + \kappa_0 \int_0^t e^{d_2 (t-\tau)}(|a_j - 1|^2_s + |\xi|^2_{s+1/2} + |g_j|^2_s) d\tau, \]
where \( \kappa_0 \) is as in (6.42),
\begin{equation}
d_2 = d_2(C_0, c_0, \mu, 2M_0, 2M_{0,1}, K_{\alpha}(2M_0), K_{\alpha}, 2M_0, \sup_{0 \leq t \leq T} |u^{j+1}(t)|_{1+q})
\end{equation}
is the constant defined in (6.38), and \( K_{\alpha} \) is as in (6.45). From (6.47) we have that
\begin{equation}
\sup_{0 \leq t \leq T} |u^{j+1}(t)|_{1+q} \leq 2M_0,
\end{equation}
therefore
\begin{equation}
d_2 \leq d_2 = d_2(C_0, c_0, \mu, 2M_0, 2M_{0,1}, K_{\alpha}(2M_0), K_{\alpha}, 2M_0, 2M_0).
\end{equation}
Moreover we have from Lemma 6.17 and the induction hypothesis that
\begin{equation}
|a_j - 1|^s \leq K_{\alpha}(2\kappa_0M_0), \quad |\xi|^s_{s+1/2} = |u'|_{s+1/2} \leq 2\kappa_0M_0, \quad |g_j|^s \leq K_g,
\end{equation}
where \( K_g = K_g(C_0, c_0, \mu, 2M_0, 2M_{0,1}, 2M_0, 2\kappa_0M_0) \) is the constant determined in Lemma 6.17 \( a \). Therefore
\begin{equation}
|(u^{j+1}(t), u_t^{j+1}(t))|^2_s \leq \kappa_0^2 e^{d_2 t} |(u_0, u_1)|^2_s
\end{equation}
(6.49)\[ \quad + \kappa_0 \int_0^t e^{d_2 (t-\tau)}(K_2^2(2\kappa_0M_0) + 4\kappa_0^2M_0^2 + K_3^2) d\tau \leq \kappa_0^2M_0^2 e^{d_2 t} + K_3 t e^{d_2 t}, \]
where
\begin{equation}
K_3 = \kappa_0(K_2^2(2\kappa_0M_0) + 4\kappa_0^2M_0^2 + K_3^2).
\end{equation}
Taking $T_3 = \min\{\frac{\ln 2}{d_2}, \frac{\kappa_0^2 M_0^2}{K_3}\}$, we have for all $0 < T \leq \min\{T_1, T_2, T_3, 1\}$,

\begin{equation}
(6.50) \quad \sup_{0 \leq t \leq T} |(u^{i+1}(t), u^{j+1}(t))|_s^2 \leq 4\kappa_0^2 M_0^2.
\end{equation}

We now show that there is a $0 < T \leq \min\{T_1, T_2, T_3, 1\}$, such that

\[ \inf_{0 \leq t \leq T} a_{j+1}(t) = \inf_{0 \leq t \leq T} |u^{j+1}(t) + e_0| \geq c_0. \]

Assume that $0 < T \leq \min\{T_1, T_2, T_3, 1\}$. By the same argument of (6.45), we have

\[ \sup_{0 \leq t \leq T} \|\partial_i a_{j+1}\|_{1+q} \leq k_{a, 1}, \]

where $K_{a, 1}$ is as defined in (6.45). Therefore

\[ \sup_{0 \leq t \leq T} |\partial_i a_{j+1}|_{\infty} \leq k_0 K_{a, 1}, \]

where $k_0$ is the constant from Lemma 6.1.

Taking $T_4 = \frac{C_0}{k_0 K_{a, 1}}$ and $T = \min\{T_1, T_2, T_3, T_4, 1\}$, we have for $0 \leq t \leq T$,

\[ a_{j+1}(t) = |u^{j+1}(t) + 1| \geq a_0 - \int_0^t |\partial_i a_{j+1}(\tau)|_{\infty} d\tau \geq 2c_0 - tk_0 K_{a, 1} \geq c_0. \]

So we have obtained a $T > 0, T = \min\{T_1, T_2, T_3, T_4, 1\} = T(C_0, c_0, \mu, M_0, M_0, 1, M_0)$ and a sequence $u^j \in S_T, j = 0, 1, 2, \ldots$, such that $u^j$ satisfies the recursive equation (6.44).

Step 2. We want to show that the sequence $u^j \in S_T$ constructed in Step 1 is a Cauchy sequence in some Banach space. Let $\hat{u} = u^{j+1} - u^j$. Then $\hat{u} \in \bigcap_{j=0}^2 C^j([0, T], H^{s+1/2-j/2}(R^2, C(V_3)))$, and $\hat{u}$ satisfies

\[ \hat{u}_{tt} + a_j \nabla_n \hat{u} = \tilde{g}, \]

\[ \hat{u}(\cdot, 0) = 0, \quad \hat{u}_t(\cdot, 0) = 0 \]

where $\tilde{g} = g_j - g_{j-1} - (a_j - a_{j-1}) \nabla_n u^j - a_{j-1} (\nabla_n u^j - \nabla_n u^{j-1}) u^j$. From Lemmas 6.18 and 6.11, we know that there is a constant $K_4 = K_4(C_0, c_0, \mu, M_0, M_0, 1, M_0)$, such that

\[ \|\tilde{g}(t)\|_{s-1/2} \leq K_4(\|\xi^{j+1}(t) - \xi^j(t)\|_{s-1/2} + \|u^{j+1}(t) - u^j(t)\|_{s-1/2} + \|u^{j+1}(t) - u^j(t)\|_{s-1/2}). \]

Therefore using Lemma 6.14 (6.37), we get

\[ |(\hat{u}, \hat{u}_t)|_{s-1/2}^2 \leq \kappa_0 \int_0^t e^{d_1(t-\tau)} \|\hat{g}(\tau)\|_{s-1/2}^2 d\tau \]

\[ \leq 4\kappa_0 K_4^2 e^{d_1 t} \int_0^t \|\xi^{j+1}(\tau) - \xi^j(\tau)\|_{s-1/2}^2 d\tau \]

\[ + 4\kappa_0 K_4^2 e^{d_1 t} \int_0^t (\|u^{j+1}(\tau) - u^j(\tau)\|_{s-1/2}^2 + \|u^{j+1}(\tau) - u^j(\tau)\|_{s-1/2}^2) d\tau \]

where $d_1 = d_1(C_0, c_0, \mu, 2M_0, 2M_0, 1, K_{a, 1}, 2K_0 M_0, K_{a, 1}, 2K_0 M_0)$ is the constant defined in (6.37) and $\kappa_0$ is the constant in (6.42). Since

\[ \xi^{j+1}(t) - \xi^j(t) = \int_0^t (u^{j+1}(\tau) - u^j(\tau)) d\tau, \]
Using Lemma 6.15 and a similar argument as that of Theorem 5.11 in [24], we get

\[ \| \xi^{j-1}(t) - \xi^j(t) \|_{s-1/2} \leq \int_0^t \| u^{j-1}(\tau) - u^j(\tau) \|_{s-1/2} d\tau, \]

therefore

\[ \int_0^t \| \xi^{j-1}(\tau) - \xi^j(\tau) \|_{s-1/2}^2 d\tau \leq t^2 \int_0^t \| u^{j-1}(\tau) - u^j(\tau) \|_{s-1/2}^2 d\tau \]

and

\[ |(\hat{u}_j, \hat{u}_j^j)|_{s-1/2}^2 = |(u^{j+1}(t) - u^j(t), u_t^{j+1}(t) - u_t^j(t))|_{s-1/2}^2 \]
\[ \leq 4\kappa_0 K_4^2 e^{\delta_1 t}(t^2 + 1) \int_0^t (\| u^{j-1}(\tau) - u^j(\tau) \|_{s-1/2}^2 + \| u_t^{j-1}(\tau) - u_t^j(\tau) \|_{s-1/2}^2) d\tau \]
\[ \leq 4\kappa_0 K_4^2 e^{\delta_1 T}(T^2 + 1) \int_0^t (\| u^{j-1}(\tau) - u^j(\tau) \|_{s-1/2}^2 + \| u_t^{j-1}(\tau) - u_t^j(\tau) \|_{s-1/2}^2) d\tau. \]

This proves that \( u^j \) is a Cauchy sequence in \( \bigcap_{j=0}^1 C^j([0, T], H^{s-j/2}(R^2, C(V_3))) \). Therefore there exists \( u \in \bigcap_{j=0}^1 C^j([0, T], H^{s-j/2}(R^2, C(V_3))) \), such that

\[ u^j \to u \quad \text{in} \quad \bigcap_{j=0}^1 C^j([0, T], H^{s-j/2}(R^2, C(V_3))). \]

Furthermore, \( a_j \to a = |u_t + \epsilon_3| \) and \( g_j \to g(\xi, u, u_t) \) in \( C([0, T], H^{s-1/2}) \), where \( \xi = \xi_0 + \int_0^t u d\tau \). Let \( j \to \infty \); from (6.44) we get \( u \) is a solution of system (5.21)-(5.23),(5.29), and from (6.43),

\[ \xi(t) = \xi_0 + \int_0^t u(\tau) d\tau, \quad 0 \leq t \leq T, \]

satisfies H1–H3. We want to further verify that

\[ u \in \bigcap_{j=0}^2 C^j([0, T], H^{s+1/2-j/2}(R^2, C(V_3))). \]

Since \( u^j \in S_T \), we have that

\[ u \in L^\infty([0, T], H^{s+1/2}(R^2, C(V_3))) \quad \text{and} \quad u_t \in L^\infty([0, T], H^s(R^2, C(V_3))). \]

Using Lemma 6.15 and a similar argument as that of Theorem 5.11 in [24], we get

\[ u \in \bigcap_{j=0}^2 C^j([0, T], H^{s+1/2-j/2}(R^2, C(V_3))). \]

This proves the existence.

Uniqueness: The uniqueness can be proved by a similar argument as in step 2. We omit it. \( \square \)
§7. The nonlinear water wave equation

Assume that the initial surface \( \Sigma(0) : \xi = \xi_0(\alpha, \beta) \) and initial velocity \( u_0 \) are as given in the initial data part of §5, and that the initial acceleration \( u_1 \) satisfies (5.30). Assume further that \( \xi_0, u_0 \) and \( u_1 \) are in the Sobolev spaces as given in Theorem 6.19. In this section, we show that a solution of the quasilinear system (5.21)-(5.23), (5.29) is also a solution of the water wave system (4.3),(4.4),(4.5').

Let \( u \) be the solution obtained in Theorem 6.19, and let \( \Omega(t) : \xi = \xi_0(\alpha, \beta) + \int_0^t u(\alpha, \beta, \tau) d\tau, \) for \( t \in [0, T], \) where \( T \) is the time obtained in Theorem 6.19. Assume \( \Omega(t) \) and \( \Omega(t)^c \) are the lower and upper regions with common boundary \( \Sigma(t), \) \( N = \xi_\alpha \times \xi_\beta, \) and \( n = \frac{N}{|N|}. \) In order to prove that \( \Sigma(t) : \xi = \xi_0(\alpha, \beta) + \int_0^t u(\alpha, \beta, \tau) d\tau, \) for \( t \in [0, T], \) is a solution of (4.3),(4.4),(4.5'), it is enough to show \( \tilde{n} = n \) and \( u = H_{\Sigma(0)} u \) for \( 0 \leq t \leq T. \) We know when \( t = 0, \) \( \tilde{n}(0) = n(0) \) and \( u_0 = H_{\Sigma(0)} u_0. \)

We first introduce some notation and develop some identities and lemmas. We denote by \( \nabla_\xi \) or \( \nabla_\xi^\pm = (\partial_\xi^+, \partial_\xi^-, \partial_\xi^+) \) the space valued gradient with respect to \( \Omega(t) \) as defined in (3.9), and by \( \nabla_\xi^- = (\partial_\xi^-, \partial_\xi^-, \partial_\xi^-) \) the space valued gradient with respect to \( \Omega(t)^c; \) \( \nabla_n = \nabla_\xi^+; \) \( \partial_\xi ; \) \( \partial_\xi^\pm \) are the Clifford 1-vector counterparts of \( \nabla_\xi \) and \( \nabla_\xi^- \) respectively; \( H_{\Sigma(t)} \) is the Hilbert transform with respect to the region \( \Omega(t) \) as defined in (3.1), therefore the Hilbert transform with respect to \( \Omega(t)^c = -H_{\Sigma(t)}. \) For \( \sigma = \sigma_1 e_1 + \sigma_2 e_2 + \sigma_3 e_3 + \sigma_{123} e_1 e_2 e_3, \) we denote by \( \sigma(3) \) the 3-vector part \( \sigma_{123} e_1 e_2 e_3 \) of \( \sigma; \) \( \tilde{H}_{\Sigma(t)} u = H_{\Sigma(t)} u - \{ H_{\Sigma(t)} u \}_{(3)} \) is therefore the 1-vector part of \( H_{\Sigma(t)} u. \) For the purpose of this section, we do not distinguish the notation for operators bounded from \( L_2(R^2) \) to \( L_2(R^2), \) they are indicated by either \( T \) or \( T_i, \) \( i = 1, 2, 3, \ldots. \)

Claim 1. Let \( f \) be a real scalar-valued function on \( R^2. \) Then

(7.1) \[ \Re\{ (I - H_{\Sigma(t)})(I - \mathcal{K})^{-1} f \} = f, \]

where \( \mathcal{K} \) is the double layered potential operator on \( \Sigma(t) \) as defined in (2.11).

Claim 1 is straightforward by definition.

Claim 2. Assume that \( F = f_1 e_1 + f_2 e_2 + f_3 e_3, \) and \( F = -H_{\Sigma(t)} F. \) Then

(7.2) \[ F = -(I - H_{\Sigma(t)})(n(I + \mathcal{K}^*))^{-1}\Re(nF)). \]

Proof. Let \( F^h \) be the harmonic extension of \( F \) on \( \Omega(t)^c. \) Then \( F^h \) is Clifford analytic on \( \Omega(t)^c. \) Therefore \( \text{curl} \ F^h = \text{div} \ F^h = 0. \) Since \( \Omega(t)^c \) is simply connected, there is a function \( f, \) \( f \) harmonic on \( \Omega(t)^c, \) such that \( F^h = D^\perp f. \) (7.2) is therefore a consequence of (3.14). \( \square \)

Claim 3. \( \nabla_n + \nabla_n^- \) is a bounded operator from \( L_2(\Sigma(t), dS) \) to \( L_2(\Sigma(t), dS). \)

This is a standard result from potential theory; see [15, Theorem 5.2].

Claim 4.

(7.3) \[ N_t = -\frac{1}{2} |N| \{ \nabla_n^+(u + \tilde{H}_{\Sigma(t)} u) + \nabla_n^-(u - \tilde{H}_{\Sigma(t)} u) \}. \]
Proof. A calculation as in (5.4) shows that
\[ (u \pm \bar{H}_{\Sigma(t)} u)_{\alpha} \times \xi_{\beta} + \xi_{\alpha} \times (u \pm \bar{H}_{\Sigma(t)} u)_{\beta} \]
\[ = -(N \cdot \nabla_{\bar{x}}^\pm)(u \pm \bar{H}_{\Sigma(t)} u) - N \times (D_{\xi}^\pm \times (u \pm \bar{H}_{\Sigma(t)} u)). \]

Since \( u + H_{\Sigma(t)} u \) and \( u - H_{\Sigma(t)} u \) are the boundary values of Clifford analytic functions on \( \Omega(t) \) and \( \Omega(t)^c \) respectively, we have
\[ D_{\xi}^\pm (u \pm H_{\Sigma(t)} u) = 0, \]
therefore its 2-vector part
\[ D_{\xi}^\pm (u \pm H_{\Sigma(t)} u) \pm D_{\xi}^\pm (\{H_{\Sigma(t)} u\}_3) = 0. \]

So
\[ N \times (D_{\xi}^\pm \times (u \pm \bar{H}_{\Sigma(t)} u)) = \mp (\xi_{\alpha} \times \xi_{\beta} \times (u \pm \bar{H}_{\Sigma(t)} u)_{\beta}) \]
\[ = \pm [\xi_{\beta} \partial_{\alpha} (\{H_{\Sigma(t)} u\}_3) - \xi_{\alpha} \partial_{\beta} (\{H_{\Sigma(t)} u\}_3)] \]
This implies that
\[ (u \pm \bar{H}_{\Sigma(t)} u)_{\alpha} \times \xi_{\beta} + \xi_{\alpha} \times (u \pm \bar{H}_{\Sigma(t)} u)_{\beta} \]
\[ = -(N \cdot \nabla_{\bar{x}}^\pm)(u \pm \bar{H}_{\Sigma(t)} u) \pm [\xi_{\beta} \partial_{\alpha} (\{H_{\Sigma(t)} u\}_3) - \xi_{\alpha} \partial_{\beta} (\{H_{\Sigma(t)} u\}_3)] \]
and
\[ N_t = u_{\alpha} \times \xi_{\beta} + \xi_{\alpha} \times u_{\beta} = -\frac{1}{2} [(N \cdot \nabla_{\bar{x}}^\pm)(u \pm \bar{H}_{\Sigma(t)} u) + (N \cdot \nabla_{\bar{x}}^\pm)(u - \bar{H}_{\Sigma(t)} u)]. \]
This proofs (7.3). \( \Box \)

A consequence of (7.3) and Claim 3 is that
\[ n_t = (\nabla_{\bar{n}}(\bar{H}_{\Sigma(t)} u) \times \bar{n}) \times n + T(u - H_{\Sigma(t)} u), \]
where \( T \) is a bounded linear operator from \( L_2(R^2) \) to \( L_2(R^2) \).

Claim 5. Let \( u \) be a solution of (5.21)-(5.23). Then
\[ \{\nabla_{\bar{n}}(H_{\Sigma(t)} u)\}_3 = \{H_{\Sigma(t)}(\nabla_{\bar{n}} u + n_t)\}_3 + T(u - H_{\Sigma(t)} u) \]
where \( T \) is a bounded operator from \( L_2 \) to \( L_2 \).

Proof. Since \( N D_{\xi}^\pm (u \pm H_{\Sigma(t)} u) = 0 \), we have that its 3-vector part
\[ \mp N \cdot D_{\xi}^\pm (\{H_{\Sigma(t)} u\}_3) - (N \times D_{\xi}^\pm \cdot (u \pm \bar{H}_{\Sigma(t)} u)e_1 e_2 e_3 = 0. \]
From \( N \times D_{\xi}^\pm = \xi_{\beta} \partial_{\alpha} - \xi_{\alpha} \partial_{\beta} \), we have by adding up the above two identities,
\[ (N \cdot D_{\xi}^\pm - N \cdot D_{\xi}^-)(\{H_{\Sigma(t)} u\}_3) = -2(N \times D_{\xi}^\pm \cdot u)e_1 e_2 e_3, \]
so
\[ \nabla_{\bar{n}}(\{H_{\Sigma(t)} u\}_3) = \frac{1}{2} [\nabla_{\bar{n}}^\pm + \nabla_{\bar{n}}^-](\{H_{\Sigma(t)} u\}_3) - (n \times D_{\xi}) \cdot u e_1 e_2 e_3. \]

On the other hand,
\[ n D_{\xi} u = n H_{\Sigma(t)}(D_{\xi} u) = (n H_{\Sigma(t)} + H_{\Sigma(t)} n)(D_{\xi} u) - H_{\Sigma(t)}(n D_{\xi} u). \]
Taking the 3-vector part of both sides of (7.6), we get
\[ -(n \times D_{\xi}) \cdot u e_1 e_2 e_3 = \{(n H_{\Sigma(t)} + H_{\Sigma(t)} n)(D_{\xi} u)\}_3 \]
\[ + \{H_{\Sigma(t)}(\nabla_{\bar{n}} u - (n \times D_{\xi}) \times u)\}_3. \]
Notice that
\[
D_\xi u = \frac{1}{2} D_\xi (u - H_{\Sigma(t)} u),
\]
\[
(n \times D_\xi) \times u = -\frac{N_1}{|N|} u_{\tau} + \partial_\tau (\frac{1}{|N|}) N, \quad \text{and the operator } (n H_{\Sigma(t)} + H_{\Sigma(t)} u) D_\xi \text{ is a bounded operator from } L_2 \text{ to } L_2. \quad \text{Together with Claim 3, we conclude (7.5).} \]

**Claim 6.** Let \( u \) be a solution of (5.21)-(5.23). Then
\[
\{ (H_{\Sigma(t)} u)_{\nu} + a \nabla_n (H_{\Sigma(t)} u) \} (3) = T_1 (u - H_{\Sigma(t)} u) + T_2 (\tilde{n} - n)
\]
where \( T_1, T_2 \) are bounded operators from \( L_2 \) to \( L_2 \).

**Proof.** We have from integration by parts that
\[
\{ H_{\Sigma(t)} u \} (3) = -p.v. \int \int K(\zeta' - \xi) \times (\zeta''_{\alpha'} \times \zeta''_{\beta'}) \cdot u' \; d\alpha' d\beta' e_1 e_2 e_3
\]
\[
= -2 \int \int ((\zeta''_{\alpha'} \times \zeta''_{\beta'}) \times \nabla_{\zeta'}) \Gamma(\zeta' - \xi) \cdot u' \; d\alpha' d\beta' e_1 e_2 e_3
\]
\[
= -2 \int \int (\zeta''_{\beta'} \partial_{\alpha'} - \zeta''_{\alpha'} \partial_{\beta'}) \Gamma(\zeta' - \xi) \cdot u' \; d\alpha' d\beta' e_1 e_2 e_3
\]
\[
= 2 \int \int \Gamma(\zeta' - \xi) (\zeta''_{\beta'} \partial_{\alpha'} u' - \zeta''_{\alpha'} \partial_{\beta'} u') \; d\alpha' d\beta' e_1 e_2 e_3,
\]
therefore
\[
\{ (H_{\Sigma(t)} u)_{\nu} \} (3) = 2 \int \int \partial_\nu^2 \{ \Gamma(\zeta' - \xi) \} (\zeta''_{\beta'} \partial_{\alpha'} u' - \zeta''_{\alpha'} \partial_{\beta'} u') \; d\alpha' d\beta' e_1 e_2 e_3
\]
\[
+ 4 \int \int \partial_\nu \{ \Gamma(\zeta' - \xi) \} (\zeta''_{\beta'} \partial_{\alpha'} u' - \zeta''_{\alpha'} \partial_{\beta'} u') \; d\alpha' d\beta' e_1 e_2 e_3
\]
\[
+ 2 \int \int \Gamma(\zeta' - \xi) (\zeta''_{\beta'} \partial_{\alpha'} u' - \zeta''_{\alpha'} \partial_{\beta'} u')_{\nu} \; d\alpha' d\beta' e_1 e_2 e_3.
\]
Since \( ND_\xi (u + H_{\Sigma(t)} u) = 0 \), we have the 3-vector parts \( N \times D_\xi \cdot (u + \tilde{H}_{\Sigma(t)} u) e_1 e_2 e_3 = -(N \cdot D_\xi) \{ H_{\Sigma(t)} u \} (3) \). Therefore
\[
(\zeta_{\beta} \cdot \partial_{\alpha} u - \zeta_{\alpha} \cdot \partial_{\beta} u) e_1 e_2 e_3 = (N \times D_\xi) \cdot u e_1 e_2 e_3
\]
\[
= \frac{1}{2} (N \times D_\xi) \cdot (u - \tilde{H}_{\Sigma(t)} u) e_1 e_2 e_3 - \frac{1}{2} (N \cdot D_\xi) \{ H_{\Sigma(t)} u \} (3),
\]
and the term
\[
p.v. \int \int \partial_\nu^2 \{ \Gamma(\zeta' - \xi) \} (\zeta''_{\beta'} \cdot \partial_{\alpha'} u' - \zeta''_{\alpha'} \cdot \partial_{\beta'} u') \; d\alpha' d\beta' e_1 e_2 e_3 = T (u - H_{\Sigma(t)} u)
\]
where \( T \) is a bounded operator from \( L_2 \) to \( L_2 \).
We have that
\[
(\zeta_{\beta} \cdot \partial_{\alpha} u - \zeta_{\alpha} \cdot \partial_{\beta} u)_{\nu} = \zeta_{\beta} \cdot \partial_{\alpha} u_{\tau} - \zeta_{\alpha} \cdot \partial_{\beta} u_{\tau}
\]
\[
= \zeta_{\beta} \cdot \partial_{\alpha} (a (\tilde{n} - n)) - \zeta_{\alpha} \cdot \partial_{\beta} (a (\tilde{n} - n)) ;
\]
here we used the fact that \( u_{\tau} + e_3 = a \tilde{n} \) and
\[
\{H_{\Sigma(t)} u\}_{3} = \frac{1}{2} (\zeta_{\beta} \cdot (an)_{\alpha} - \zeta_{\alpha} \cdot (an)_{\beta} = 0
\]
for any scalar-valued function \( a \). Therefore

\[
p.v. \int \partial_t \left\{ \Gamma'(\xi' - \xi) (\xi' \cdot \partial_{\alpha'} u - \xi' \cdot \partial_{\beta'} u') \right\} \, d\alpha' d\beta' e_1 e_2 e_3
\]

\[
= p.v. \int \partial_t \left\{ \Gamma'(\xi' - \xi) (\xi' \cdot \partial_{\alpha'} \{ a'(\hat{n}' - n') \} - \xi' \cdot \partial_{\beta'} \{ a'(\hat{n}' - n') \}) \right\} \, d\alpha' d\beta' e_1 e_2 e_3
\]

\[
= T(\hat{n} - n),
\]

where \( T \) is a bounded operator from \( L_2 \) to \( L_2 \).

Now we look at the last term in (7.8). From (7.9) and (7.10) we have

\[
(\xi_3 \cdot \partial_{\alpha} u - \xi_{3'} \cdot \partial_{\beta} u)_{tt} = \xi_{3\beta} \cdot \partial_{\alpha} \{ a(\hat{n} - n) \} - \xi_{3\alpha} \cdot \partial_{\beta} \{ a(\hat{n} - n) \}
\]

\[
+ \xi_3 \cdot \partial_{\alpha} \{ u_t - an_t \} - \xi_{3'} \cdot \partial_{\beta} \{ u_t - an_t \}.
\]

Using (7.10), the fact that \( u \) satisfies equation (5.21), Claim 5 and Claim 4, we get

\[
2 p.v. \int \Gamma(\xi' - \xi) (\xi' \cdot \partial_{\alpha'} u' - \xi' \cdot \partial_{\beta'} u')_t \, d\alpha' d\beta' e_1 e_2 e_3
\]

\[
= 2 p.v. \int \Gamma(\xi' - \xi) (-\xi' \cdot \partial_{\alpha'} \{ a'\nabla u + a' \n' \})
\]

\[
+ \xi' \cdot \partial_{\beta'} \{ a'\nabla u + a' \n' \}) \, d\alpha' d\beta' e_1 e_2 e_3 + T_1(\hat{n} - n)
\]

\[
= -H_{\Sigma(t)}(a\nabla u + an_t) + T_1(\hat{n} - n)
\]

\[
= -a[H_{\Sigma(t)}(\nabla u + n_t)] + T_1(\hat{n} - n) + T_2(u - H_{\Sigma(t)} u),
\]

where \( T_1 \) and \( T_2 \) are bounded operators from \( L_2 \) to \( L_2 \). This proves Claim 6. \( \square \)

Now let’s introduce a new vector \( \hat{n} \). We define \( \hat{n} = \frac{(\overline{H}_{\Sigma(t)} u)_t + e_3}{|H_{\Sigma(t)} u|} \) to be the unit vector in the direction of \((\overline{H}_{\Sigma(t)} u)_t + e_3\). Then \( \hat{n}(0) = n(0) \), and there is a time \( 0 < T_0 \leq T \), \( T_0 = T_0(s_0, c_0, m_0, M_0, M_0, M_0) \), such that the vector \( \hat{n} \) is defined for \( 0 \leq t \leq T_0 \). We know that for \( 0 \leq t \leq T_0 \), \( \hat{n} = \hat{n} = T((u - H_{\Sigma(t)} u)_t) \), where \( T \) is a bounded operator from \( L_2 \) to \( L_2 \).

We are now ready to show that \( \hat{n} = n \) and \( u = H_{\Sigma(t)} u \) for \( 0 \leq t \leq T \). Our idea is to show that \( u - H_{\Sigma(t)} u \) and \( \hat{n} - n \) satisfies a linear differential system, which together with the initial data \( \hat{n}(0) = n(0) = 0 \) and \( u_0 = H_{\Sigma(t)} u_0 = 0 \) implies that \( \hat{n} = n \) and \( u = H_{\Sigma(t)} u \) for \( 0 \leq t \leq T_0 \). This would give that \( \hat{n} = \hat{n} = n \) for \( 0 \leq t \leq T_0 \). The same process can then be applied to \( T_0 \leq t \leq 2T_0 \), and we would have \( \hat{n} = n \) and \( u = H_{\Sigma(t)} u \) for \( T_0 \leq t \leq 2T_0 \). After finitely many steps, we would have that \( \hat{n} = n \) and \( u = H_{\Sigma(t)} u \) for all \( 0 \leq t \leq T \).

Let \( u \) be a solution of (5.21)-(5.23), (5.29). It is easy to see from the derivations in §5 that \( u \) satisfies

\[
\Re \{ \hat{n}(I - H_{\Sigma(t)}) (u_{tt} + a\nabla u - u_t - a(n \cdot \nabla u)) \} = 0,
\]

therefore

\[
(7.11) \quad \Re \{ n(I - H_{\Sigma(t)}) (u_{tt} + a\nabla u - u_t - a(n \cdot \nabla u)) \} = T(\hat{n} - n),
\]
where $T$ is a bounded linear operator from $L_2$ to $L_2$. Now

$$(I - H_\Sigma(t))(u_{tt} + a\nabla_n u - \mu_{tt} - a\nabla_n \mu)$$

$$= 2(u_{tt} + a\nabla_n u - \mu_{tt} - a\nabla_n \mu) - (I + H_\Sigma(t))(u_{tt} + a\nabla_n u - \mu_{tt} - a\nabla_n \mu)$$

$$= (u - H_\Sigma(t)u)_{tt} + a\nabla_n (u - H_\Sigma(t)u) + \frac{1}{2}[\partial^2_t, H_\Sigma(t)](u - H_\Sigma(t)u)$$

$$- \frac{1}{2}(I + H_\Sigma(t))(a(\nabla_n + \nabla_n)(u - H_\Sigma(t)u))$$

$$- [an_1, H]\partial_x (u - H_\Sigma(t)u) - [an_2, H]\partial_y (u - H_\Sigma(t)u)$$

$$- [an_3, H]\partial_z (u - H_\Sigma(t)u),$$

where $n_i$, $i = 1, 2, 3$, are components of $n$, so

$$\tag{7.12} (I - H_\Sigma(t))(u_{tt} + a\nabla_n u - \mu_{tt} - a\nabla_n \mu) = (u - H_\Sigma(t)u)_{tt} + a\nabla_n (u - H_\Sigma(t)u)$$

$$+ T_1(u - H_\Sigma(t)u) + T_2((u - H_\Sigma(t)u)_{tt}),$$

where $T_1, T_2$ are bounded operators from $L_2$ to $L_2$. Therefore from Claim 6,

$$\tag{7.13} \{(I - H_\Sigma(t))(u_{tt} + a\nabla_n u - \mu_{tt} - a\nabla_n \mu)\} = -\{(H_\Sigma(t)u)_{tt} + a\nabla_n (H_\Sigma(t)u)\} + T_1(u - H_\Sigma(t)u) + T_2((u - H_\Sigma(t)u)_{tt})$$

$$= T_1(u - H_\Sigma(t)u) + T_2((u - H_\Sigma(t)u)_{tt}) + T_3(\hat{n} - n),$$

where $T_1, T_2, T_3$ are bounded operators from $L_2$ to $L_2$. Now

$$F = (I - H_\Sigma(t))(u_{tt} + a\nabla_n u - \mu_{tt} - a\nabla_n \mu)$$

$$- (I - H_\Sigma(t))(I - K)^{-1}\{(I - H_\Sigma(t))(u_{tt} + a\nabla_n u - \mu_{tt} - a\nabla_n \mu)\}$$

is a 1-vector-valued function satisfying the assumption of Claim 2. From (7.2), (7.11) and (7.13), we get

$$F = T_1(u - H_\Sigma(t)u) + T_2((u - H_\Sigma(t)u)_{tt}) + T_3(\hat{n} - n),$$

where $T_1, T_2, T_3$ are bounded from $L_2$ to $L_2$. Consequently from (7.12) and (7.13),

$$\tag{7.14} (u - H_\Sigma(t)u)_{tt} + a\nabla_n (u - H_\Sigma(t)u)$$

$$= T_1(u - H_\Sigma(t)u) + T_2((u - H_\Sigma(t)u)_{tt}) + T_3(\hat{n} - n),$$

where $T_1, T_2, T_3$ are operators bounded from $L_2$ to $L_2$. Now we want to derive an equation of $(\hat{n} - n)$. Let

$$c = -(I + \tilde{K}^*)^{-1}(\Re\{\hat{n} f(\xi, u, u_\xi)\}).$$

(5.21) becomes $u_{tt} + a\nabla_n u = \hat{n}c$. Let $b = |(\tilde{H}_\Sigma(t)u)_t + e_3|$. Then $(\tilde{H}_\Sigma(t)u)_t + e_3 = b\hat{n}$ and

$$\tilde{H}_\Sigma(t)u) = b\hat{n} + b\hat{n}.$$

From (7.14), we have

$$\tag{7.15} (H_\Sigma(t)u)_{tt} + a\nabla_n (H_\Sigma(t)u)$$

$$= \hat{n}c + T_1(u - H_\Sigma(t)u) + T_2((u - H_\Sigma(t)u)_{tt}) + T_3(\hat{n} - n)$$

$$= \hat{n}c + T_1(u - H_\Sigma(t)u) + T_2((u - H_\Sigma(t)u)_{tt}) + T_3(\hat{n} - n),$$
(7.16)  
\[ b n_t = -a \nabla_n (H_{\Sigma(t)} u) + \dot{n}c - b \dot{n} + T_1(u - H_{\Sigma(t)} u) + T_2((u - H_{\Sigma(t)} u)_t) + T_3(\dot{n} - n). \]

Since \( a - b = T((u - H_{\Sigma(t)} u)_t) \) is a bounded operator from \( L_2 \) to \( L_2 \), we have

\[ \dot{n}_t = (\nabla_n (H_{\Sigma(t)} u) \times \dot{n}_t) \times \dot{n}_t + T_1(u - H_{\Sigma(t)} u) + T_2((u - H_{\Sigma(t)} u)_t) + T_3(\dot{n} - n). \]

Combining with (7.4), we obtain

(7.17)  
\[ (\dot{n} - n)_t = T_1(u - H_{\Sigma(t)} u) + T_2((u - H_{\Sigma(t)} u)_t) + T_3(\dot{n} - n). \]

Using the results in the estimate part of §6, it is easy to establish an energy estimate for system (7.14),(7.17). With the initial data \( \dot{n}(0) = n(0) \) and \( u_0 = H_{\Sigma(0)} n_0 \), we conclude that

\[ \dot{n}(t) = n(t) \quad \text{and} \quad u(t) = H_{\Sigma(t)} u(t), \quad \text{for} \ 0 \leq t \leq T_0, \]

so \( \dot{n}(t) = n(t) \) for \( 0 \leq t \leq T_0 \). Now taking \( T_0 \) as the initial time, we obtain

\[ \dot{n}(t) = n(t) \quad \text{and} \quad u(t) = H_{\Sigma(t)} u(t), \quad \text{for} \ 0 \leq t \leq 2T_0. \]

After finitely many steps, we get

\[ \dot{n}(t) = n(t) \quad \text{and} \quad u(t) = H_{\Sigma(t)} u(t), \quad \text{for} \ 0 \leq t \leq T. \]

This proves that a solution of (5.21)-(5.23), (5.29) is also a solution of (4.3),(4.4), (4.5').

We can now state the well-posedness result of the nonlinear waterwave system (4.3),(4.4),(4.5').

Let \( \xi_0, \xi_1 = u_0 \) be as given in the initial data part of §5. In particular, let \( \Sigma(0) : \xi = \xi_0(\alpha, \beta) \) be a surface that divides \( R^3 \) into two simply connected regions. Assume that there are vectors \( e_\alpha, e_\beta \), such that \( e_\alpha \times e_\beta = e_3, \xi_0, \xi - e_\alpha, \xi_0, \beta - e_\beta \in H^{s-1/2}(R^2, C(V_3)) \); and there are constants \( \mu > 0, C_0 > 0 \), such that

\[ |\xi_0, \alpha \times \xi_0, \beta| \geq 2\mu, \quad \text{for} \ -\infty < \alpha, \beta < \infty, \]

\[ |\xi_0(\alpha, \beta) - \xi_0(\alpha', \beta')| \geq 2C_0(|\alpha - \alpha'| + |\beta - \beta'|), \quad \text{for} \ -\infty < \alpha, \beta < \infty. \]

Assume that \( n_0 - e_3 \in H^s, \) where \( n_0 = \frac{\xi_0, \alpha \times \xi_0, \beta}{|\xi_0, \alpha \times \xi_0, \beta|} \).

**Theorem 7.1.** Let \( s \geq 5/2 + q \), where \( q > 1 \). Assume further that

\[ \xi_1 \in H^{s+1/2}(R^2, C(V_3)). \]

Then there exists \( T > 0 \), such that the system (4.3),(4.4),(4.5') has a unique solution \( \xi = \xi(\alpha, \beta, t) \) for \( 0 \leq t \leq T \), with the property that the surfaces \( \Sigma(t) : \xi = \xi(\alpha, \beta, t), \) \( 0 \leq t \leq T \), satisfy \( H^1-H^3 \) of §6, and

\[ \xi_{\ell} \in C^j([0, T], H^{s+1/2-j/2}(R^2, C(V_3))), \]

for \( j = 0, 1, 2 \).
ACKNOWLEDGMENT

I would like to thank Russ Caflisch and Tom Hou for their idea about the sign condition and for my very pleasant visit at UCLA and Caltech; I would also like to thank Tom Beale for referring me to the work of Andreev [26]. I have talked about the results in this paper in seminars at UCLA, Brown University, IAS, Courant Institute, Princeton University, University of Arizona, the AMS meeting at College Park, Maryland, and the workshop at MSRI; comments and questions from audiences have influenced the final outcome of this paper. I would like to thank my hosts and audiences in my talks. In particular, I would like to thank Walter Craig, Carlos Kenig and Lihe Wang. I would also like to thank Siye Wu for discussions on the physical meaning of this and my previous work.
