Some Probability Density Functions and Their Characteristic Functions

By Frank McNolty

Abstract. This paper presents, without derivation, several generalized density functions together with their characteristic functions. The densities are expressed variously in terms of special functions such as: \( I_\nu(x) \), the modified Bessel function of the first kind of order \( \nu \); \( K_\nu(x) \), the modified Bessel function of the second kind of order \( \nu \); \( F_1(a; b; x) \), the confluent hypergeometric function; \( F_2(a; b; c; x) \), the hypergeometric function; \( W_\alpha, \beta(x) \), Whittaker's function; \( \Phi_d(b; \gamma; bx, cx) \), a generalized hypergeometric function (type I); 
\[ \Phi_d(b, c, d; \gamma; \lambda x, \tau x, \beta x), \]
a generalized hypergeometric function (type II); and \( \phi_v(be^x) \), a generalized Bessel type function. The first five cases are summarized from the work of Laha [7], Pearson [25] and Raj [26] while Cases 13 through 19 have not previously appeared in the literature of statistics or Fourier transforms. In what follows, the usual notation \( f(x) \), for a density function, and \( \varphi(t) \), for a characteristic function, will be used with all parameters considered as real quantities:
\[ \varphi(t) = \int_{-\infty}^{\infty} \exp(itx)f(x)dx. \]

Case 1. Laha [7], Bose [2], Bose [3], Erdélyi [4], McKay [14], McNolty [15]-[22].
In this case and in Cases 3, 6-12 and 15-18, the function \( f(x) = 0 \) for \( x < 0 \).

\[ f(x; \gamma, \gamma, Q) = 2^{\frac{Q/2-3/2}{2}} \frac{x^{Q-1/2}}{\gamma^Q} \cdot \exp \left( -\frac{\gamma^2}{4\lambda} - \frac{\lambda}{2} x \right) \cdot I_{Q-1} \left( \gamma \left( \frac{x}{2} \right)^{1/2} \right), \quad x \geq 0, \]
\[ \gamma \geq 0, \lambda \geq 0, Q > 0, \]

\[ \varphi(t) = \left( 1 - \frac{2it}{\lambda} \right)^{-Q} \cdot \exp \left[ \frac{it\gamma^2}{2\lambda^2} \left( 1 - \frac{2it}{\lambda} \right) \right]. \]

Case 2. Pearson [25], Bhattacharyya [1], Bose [3], Erdélyi [4], Sastry [6], Laha [7], McKay [14], McNolty [20].

\[ f(x; a, \nu) = \frac{a(|x| a)^\nu K_\nu(|x| a)}{2^\nu \pi^{1/2} \Gamma(\nu + \frac{1}{2})}, \quad -\infty < x < \infty, \]
\[ a > 0, \nu > -\frac{1}{2}, \]

\[ \varphi(t) = a^{\nu+1}/(t^2 + a^2)^{\nu+1/2}. \]

Case 3. Raj [26], McNolty [20].

\begin{align}
\phi_\mu(bx^\mu) &= \sum_{r=0}^{\infty} \frac{(bx^\mu)^r}{r! \Gamma(1 + \lambda + \mu r)}, \\
\varphi(t) &= \left(1 - \frac{it}{a}\right)^{-\lambda-1} \cdot \exp\left(-\frac{b}{a^\lambda} \left[1 - \left(1 - \frac{it}{a}\right)^{-\mu}\right]\right).
\end{align}

**Case 4.** Laha [7].

\begin{align}
(f(x; a, b, c)) &= e^{-c/2} \frac{x^{(a+b)/2-1}}{2^{(a+b)/2}} \sum_{r=0}^{\infty} \frac{(-1)^r x^r}{\Gamma(a+r)2^r} W_{(a-b)/2, (a+b+2r-1)/2}(2x), \\
&\quad x > 0, \\
&\quad = (-1) \cdot [\text{expression (7a) with } x \text{ replaced by } (-x)] \\
&\quad \text{and } \Gamma(a+r) \text{ replaced by } \Gamma(b+r)], \quad x < 0,
\end{align}

Here, expressions (7a) and (7b) differ from the result given in [7].

**Case 5.** Laha [7]. Letting \(a = b\) in expression (7) gives

\begin{align}
f(x; a, c) &= e^{-c/2} \frac{|x|^{a-1/2}}{2^{1/2} \Gamma(a+n/2)2^{n} \cdot \sum_{n=0}^{\infty} \frac{|x|^n}{n! \Gamma(a+n)2^{2n} \cdot K_{a+n-1/2}(|x|)}}, \\
&\quad -\infty < x < \infty,
\end{align}

\(a > 0, c \geq 0; a + b > 1\).

**Case 6.** Erdélyi [4], McNolty [19]-[21].

\begin{align}
f(x; a, b; \nu, \mu) &= \frac{a^b b^\nu}{\Gamma(\nu + \mu)} e^{-bx} x^{\nu+\mu-1} I_\nu(b \nu + \mu; (b - a)x), \quad x \geq 0, \\
&\quad \mu + \nu > 0; a, b \geq 0; \begin{cases} b > a, \nu > 0, \nu + \mu > 0 (\mu \text{ may be negative}); \\
\mathbf{a > b, \nu > 0, \nu + \mu > 0 (\nu \text{ may be negative});}
\end{cases}
\end{align}

\begin{align}
\varphi(t) &= a^b b^\nu/(a - it)^\nu/(b - it)^\nu.
\end{align}

**Case 7.** Erdélyi [4], McNolty [20].

\begin{align}
f(x; a, b; \nu) &= \frac{\pi^{1/2}(b^2 - a^2)^{\nu+1/2}}{2^\nu \Gamma(\nu + \frac{1}{2}) a^\nu} e^{-bx} x^\nu I_\nu(ax), \quad x \geq 0, \\
&\quad b > a > 0, \nu > -\frac{1}{2},
\end{align}
where expression (13) is a special case of (11).

\begin{equation}
\varphi(t) = \frac{(b^2 - a^2)^{\nu + 1/2}}{(b - it)^2 - a^2} \varphi^{\nu + 1/2}.
\end{equation}

\textbf{Case 8.} Erdélyi [4], McNolty [20].

\begin{equation}
f(x; a, b; \nu) = \frac{\pi^{1/2}(b^2 - a^2)^{\nu + 3/2}}{2^{\nu + 1} \Gamma(\nu + \frac{3}{2})a^b b} e^{-b^2x^{\nu + 1}} I_\nu(ax), \quad x \geq 0, \quad b > a > 0, \nu > -1,
\end{equation}

\begin{equation}
\varphi(t) = \frac{(b - it)(b^2 - a^2)^{\nu + 3/2}}{b[(b - it)^2 - a^2]} \varphi^{\nu + 3/2}.
\end{equation}

\textbf{Case 9.} Erdélyi [4], McNolty [20].

\begin{equation}
f(x; a, b, c; \beta, \gamma) = \frac{a^{\gamma - \beta}(a - b)^{\beta}}{\Gamma(\gamma)} x^{\gamma - 1} \cdot \exp \left( -\frac{c}{a} x \right) \cdot \Phi_3(\beta; \gamma; bx, cx), \quad x \geq 0,
\end{equation}

where

\begin{equation}
\Phi_3(\beta; \gamma; bx, cx) = \sum_{m=0}^{\infty} \sum_{n=0}^{\infty} \frac{(\beta)_m}{(\gamma)_m m! n!} b^m c^n x^{m+n},
\end{equation}

and

\begin{equation}
\varphi(t) = \frac{(a - b)^{\nu}(a - it)^{\beta - \gamma}}{a^{\beta - \gamma}(a - b - it)^{\beta}} \cdot \exp \left( \frac{ict}{a(a - it)} \right).
\end{equation}

\textbf{Case 10.} Erdélyi [4].

\begin{equation}
f(x; a, b, c, d; \beta, \gamma, \lambda, \tau) = \frac{(a - \lambda)^{\gamma}(a - \tau)^{\gamma}(a - \beta)^{\gamma}}{\Gamma(\gamma)} a^{b+c+d-\gamma} e^{-a x} x^{\gamma - 1} \cdot \Phi_3(b, c, d; \gamma; lx, lx, lx), \quad x \geq 0,
\end{equation}

where

\begin{equation}
\Phi_3(b, c, d; \gamma; lx, lx, lx) = \sum_{m=0}^{\infty} \sum_{n=0}^{\infty} \sum_{r=0}^{\infty} \frac{(b)_m(c)_n(d)_r}{(\gamma)_{m+n+r} m! n! r!} \lambda^{m+r} \beta^r x^{m+n+r},
\end{equation}

and

\begin{equation}
\varphi(t) = \frac{(a - \lambda)^{\gamma}(a - \tau)^{\gamma}(a - \beta)^{\gamma}}{(a - it - \lambda)^{\gamma}(a - it - \tau)^{\gamma}(a - it - \beta)^{\gamma} a^{b+c+d-\gamma}}.
\end{equation}

\textbf{Case 11.} Erdélyi [4], McNolty [20].

\begin{equation}
f(x; a, b, c; \gamma, \lambda, \tau) = \frac{(a - \lambda)^{\gamma}(a - \tau)^{\gamma}}{\Gamma(\gamma)} a^{b+c-d-\gamma} e^{-a x} x^{\gamma - 1} \cdot \Phi_3(b, c, \gamma; lx, lx, lx), \quad x \geq 0,
\end{equation}

where

\begin{equation}
\Phi_3(b, c, \gamma; lx, lx, lx) = \sum_{m=0}^{\infty} \sum_{n=0}^{\infty} \sum_{r=0}^{\infty} \frac{(b)_m(c)_n(\gamma)_r}{(\gamma)_{m+n+r} m! n! r!} \lambda^{m+r} \beta^r x^{m+n+r},
\end{equation}

and

\begin{equation}
\varphi(t) = \frac{(a - \lambda)^{\gamma}(a - \tau)^{\gamma}(a - \beta)^{\gamma}}{(a - it - \lambda)^{\gamma}(a - it - \tau)^{\gamma}(a - it - \beta)^{\gamma} a^{b+c+d-\gamma}}.
\end{equation}
Here expression (21) is a special case of (19).

Case 12. McNolty [16].

\[
\begin{aligned}
\Phi_2(b, c; a; \lambda x, \tau x) &= \sum_{m=0}^{\infty} \sum_{n=0}^{\infty} \frac{(b)_m(c)_n}{(\gamma)_{m+n}m!n!} \lambda^{-\tau x} x^{m+n}, \\
\varphi(t) &= \frac{(1 - \lambda)^{\frac{1}{2}}(a - \tau)^{\frac{1}{2}}(a - it)^{\frac{1}{2} - \gamma}}{(a - it - \lambda)^{\frac{1}{2}}(a - it - \gamma)^{\frac{1}{2} - \gamma}}.
\end{aligned}
\]

Case 12.

\[
\begin{aligned}
f(x; \lambda, \tau, \beta; P, Q) &= \frac{\tau^P \lambda^P Q^Q}{2^P (1 + 2\lambda \tau)^P} \exp \left( -\frac{a + bx}{1 + 2\lambda \tau} \right) \\
&\cdot \sum_{m=0}^{\infty} \frac{1}{m! \Gamma(m + Q)} \left[ \frac{abx}{(1 + 2\lambda \tau)^2} \right] \left[ Q - P; m + Q; -\frac{\lambda x}{2(1 + 2\lambda \tau)} \right],
\end{aligned}
\]

\[
a = \frac{\beta^2}{4\tau}, \quad b = \lambda^2 \tau; \quad \lambda, \tau, \beta \geq 0; \quad P, Q > 0.
\]

Case 13.

\[
\begin{aligned}
f(x) &= \frac{\beta^2 \exp(-\gamma^2/4\beta)}{(\lambda^2 - it)^{\frac{3}{2}(a+b)/2-1}} \cdot (-1)^x \\
&\cdot \sum_{n=0}^{\infty} \frac{\Gamma(n + c)x^n}{(\beta + 1)^n n! \Gamma(a + n)2^n} \binom{a + 2}{b + 1} \cdot W_{(a-b)/2, (a+b+2n-1)/2}(2x). \\
&\quad \text{x} > 0,
\end{aligned}
\]

\[
a, b, c > 0; \gamma, \beta \geq 0; a + b > 1,
\]

\[
\begin{aligned}
&\quad x < 0, \quad \text{and} \quad \Gamma(a + n) \text{ replaced by} \, \Gamma(b + n),
\end{aligned}
\]

Case 14.

\[
\begin{aligned}
f(x) &= \frac{\pi^{1/2}(b^2 - a^2)^{1/2} \Gamma(c + d)/2-1}{(2b + 1)^{2r+1} \Gamma(\nu + \frac{1}{2})^{2(c+d)/2-1}} \sum_{n=0}^{\infty} \frac{(-1)^{\frac{1}{2}}}{{n!} \Gamma(c + n)2^{n}(2b + 1)^n} \\
&\cdot \frac{4\nu^2}{(2b + 1)^{2}} \binom{n}{\nu} + \frac{1}{2} \cdot \binom{n}{\nu} + v + 1; \quad \nu + 1; \quad 4a^2 \\
&\cdot W_{(c-d)/2, (c+d+2n-1)/2}(2x), \quad \text{x} > 0,
\end{aligned}
\]

\[
c, d > 0; \quad b > a > 0; \quad v > -\frac{1}{2},
\]

\[
\begin{aligned}
&\quad x < 0, \quad \text{and} \quad \Gamma(c + n) \text{ replaced by} \, \Gamma(b + n),
\end{aligned}
\]
DENSITY FUNCTIONS AND CHARACTERISTIC FUNCTIONS

\( \varphi(t) = \frac{2^{2r+1}(b^2 - a^2)^{r+1/2}(1+it)^{2r+1}}{|4(b^2 - a^2) + 4t^2[b(1+2b) - 2a^2] + t^4[(1+2b)^2 - 4a^2]|^{r+1/2} \cdot (1-it)^{r+1}}. \)

Case 15.

\[
\begin{align*}
    f(x) &= \frac{a^{x+\beta}(a - b)^{\beta}(a - it)^{\beta}\cdot \exp(-ax - \frac{\phi^2}{4\lambda})}{\Gamma(\gamma)\Gamma(c)\Gamma(d)(1 + 2\lambda \theta)^d(2 + a\lambda)^d} x^{\gamma - 1} \\
    &\cdot \sum_{m=0}^{\infty} \sum_{n=0}^{\infty} \sum_{r=0}^{\infty} \frac{(\beta)_m(c + n),(2a)^n(\lambda)^r\beta^*(c + n)\Gamma(d + r)}{(m! n! r! (2 + a\lambda)^*r(1 + 2\lambda \theta)^r)} \cdot \text{Hypergeometric Function} \\
    &\cdot \sum_{m=0}^{\infty} \sum_{n=0}^{\infty} \sum_{r=0}^{\infty} \frac{(\beta)_m(c + n),(2a)^n(\lambda)^r\beta^*(c + n)\Gamma(d + r)}{(m! n! r! (2 + a\lambda)^*r(1 + 2\lambda \theta)^r)} \cdot \text{Hypergeometric Function}, \quad x \geq 0,
\end{align*}
\]

\( a > b \geq 0; \gamma > 0; \beta, \lambda, \theta, \phi, \gamma \geq 0, \)

\( \varphi(t) = \frac{(a\lambda)^\gamma(a - b)^{\beta}(a - it)^{\beta+c}(\theta)\lambda^d[a^2\lambda - it(2 + a\lambda)]^{d-c}}{a^{d-\gamma}(a - b - it)^d[a^2\theta\lambda^2 - it[1 + \theta\lambda(2 + a\lambda)]]^d} \cdot \exp\left(-\frac{\phi^2}{4\theta} + \frac{\lambda\phi^2[a^2\lambda - it(2 + a\lambda)]}{4a^2\theta\lambda^2 - 4it[1 + \theta\lambda(2 + a\lambda)]}\right). \)

Case 16.

\[
\begin{align*}
    f(x) &= \frac{\pi^{1/2}a^{2r+\gamma-\beta+1}(d - c)^{r+1/2}(a - b)^\beta x^{\gamma - 1} e^{-ax}}{2^{2r}(ad + 1)^{2r+1}\Gamma(\gamma)\Gamma(\nu + \frac{1}{2})\Gamma(\nu + 1)} \cdot \sum_{m=0}^{\infty} \sum_{n=0}^{\infty} \frac{a^m\Gamma(n + 2\nu + 1)}{(ad + 1)^{r}(m! n!)} \cdot \text{Hypergeometric Function} \\
    &\cdot \frac{(\beta)_m b^m x^{\gamma-\gamma}e^{-ax}}{m! n!} \cdot \text{Hypergeometric Function}, \quad x \geq 0,
\end{align*}
\]

\( a > b \geq 0; \gamma > 0; \beta, \gamma \geq 0; d > c > 0; \nu > -\frac{1}{2}, \)

\( \varphi(t) = \frac{(a - b)^\beta(a - it)^{\beta+\gamma+1}a^{2r+\gamma+1}(d - c)^{r+1/2}}{(a - it)^d[a^2d - it(1 + ad)]^d - a^2c(a - it)^2}^{r+1/2}. \)

Case 17.

\[
\begin{align*}
    f(x) &= \frac{a^{\lambda+2\mu+1} \cdot \exp(-ax - \frac{\tau^2}{4\lambda}) \cdot x^\lambda}{\Gamma(b)(2 + \lambda a)^b} \\
    &\cdot \sum_{n=0}^{\infty} \frac{2^n a^n \Gamma(b + n) x^n}{n! (2 + \lambda a)^n} \cdot \text{Hypergeometric Function} \\
    &\cdot \sum_{n=0}^{\infty} \frac{2^n a^n \Gamma(b + n) x^n}{n! (2 + \lambda a)^n} \cdot \text{Hypergeometric Function}, \quad x \geq 0,
\end{align*}
\]

\( a, b, \lambda > 0; \mu \geq -1; \tau \geq 0, \)

\( \varphi(t) = \frac{(\lambda a)^{\gamma}(a - it)^{\mu} \cdot \exp(-\frac{\tau^2}{4\lambda}) \cdot a^{\lambda+1}}{(a - it)^{\lambda+1}[a - it]^d(2 + \lambda a^2) - 2a^2} \\
\cdot \exp\left[-\frac{a^2\tau^2(a - it)^{\mu}}{4(a - it)^d(2 + \lambda a^2) - 8a^2}\right]. \)
Case 18.

\[ f(x) = \frac{\pi^{1/2} (b^2 - a^2)^{\nu + 1/2} c^{\nu + \mu + \lambda + 1} x^{\lambda - cx}}{2^\nu (be^\mu + 1)^{\nu + 1} \Gamma(\nu + 1) \Gamma(\nu + 1/2) \sum_{n=0}^{\infty} \frac{(be^\mu + 1)^n}{\Gamma(1 + \mu + n\nu)}} \]  

(35)

\[ \cdot 2F_1 \left[ \begin{array}{c} \nu + \frac{n}{2} + 1/2, \nu + \frac{n}{2} + 1; \frac{a^2 c^{2\mu}}{(be^\mu + 1)^2} \end{array} \right], \quad x \geq 0, \]

\[ b > a > 0; c, \lambda > 0; \nu > -\frac{1}{2}; \mu \geq -1, \]

(36)

\[ \varphi(t) = \frac{(b^2 - a^2)^{\nu + 1/2} c^{2\nu + \mu} \cdot \gamma^{\lambda + 1}}{(c - it)^{\nu + 1} [(c - it)^\nu (1 + be^\mu) - c^{2\nu}]^2 - a^2 c^{2\nu} (c - it)^{2\mu}}. \]

Case 19. McNolty [23], [24].

\[ f(x) = x^2 e^{-x^2/2} K(a + bx^2 + cx^4), \quad -\infty < x < \infty, \]

(37)

\[ a, b, c > 0; \tau \geq 0, \]

where

\[ K = \frac{\pi^{1/2}}{4c(r_1 - r_2)} \left[ r_1^{1/2} e^{r_1} \Gamma(-\frac{1}{2}, r_1 \tau) - r_2^{1/2} e^{-r_2} \Gamma(-\frac{1}{2}, r_2 \tau) \right] \]

and \( \Gamma(a, x) \) is the incomplete gamma function, \( \Gamma(a, x) = \Gamma(a) - \gamma(a, x) \).

(38)

\[ \varphi(t) = \frac{\pi^{1/2}}{8 Kc(r_1 - r_2)} \int_\tau^{\infty} \frac{2u - t^2}{u^{5/2}} e^{-u} e^{-t^2 / u} \left[ e^{-r_1} - e^{-r_2} \right] du, \]

where \( r_1, r_2 \) are the two roots (which may be complex) given by

\[ r_1, r_2 = \frac{\pm b \pm (b^2 - 4ac)^{1/2}}{2c}, \quad b^2 \neq 4ac. \]

Case 19 was developed jointly by the author and Dr. Eldon Hansen of the Lockheed Palo Alto Research Laboratory. Expression (37) is an important function occurring in the design of optimum infrared signal processors. Other functions listed above occur in problems related to: fluctuating radar cross section, fading radio signals, weapons coverage and distributions of sums of random variables.

In expression (38), the restriction is \( r_1 \neq r_2, \) i.e., \( b^2 - 4ac \neq 0. \) If we require that \( b^2 - 4ac > 0 \) (which is the usual case in applications), then (38) becomes

\[ \varphi(t) = \frac{\pi}{2 Kc(N_2 - Q^2)} \left\{ N e^{-N_1}, \left[ \Phi \left( \frac{t}{(4\tau)^{1/2}} - N \tau^{1/2} \right) + 1 \right] \right. \]

(38a)

\[- N e^{N_1}, \left[ \Phi \left( \frac{t}{(4\tau)^{1/2}} + N \tau^{1/2} \right) + 1 \right] \]

\[- Q e^{-Q_1}, \left[ \Phi \left( \frac{t}{(4\tau)^{1/2}} - Q \tau^{1/2} \right) + 1 \right] + Q e^{Q_1}, \left[ \Phi \left( \frac{t}{(4\tau)^{1/2}} + Q \tau^{1/2} \right) + 1 \right] \]

where, in (38a), \( N = (b/2c - M)^{1/2}, Q = (b/2c + M)^{1/2}, N_2^2 = a/c, N_2 + Q^2 = b/c, M = (b^2 - 4ac)/4c^2, \) \( K \) is the normalizing factor when \( t = 0 \) and \( \Phi(x) = \text{erf}(x). \)
The restriction $b^2 - 4ac > 0$ (with $a, b, c > 0$) implies that the four poles of (37) must lie (in two conjugate pairs) on the imaginary axis of the $z = x + iy$ plane rather than falling in arbitrary locations as is the case when the constraint is simply $r_1 \neq r_2$.

**Continuous Distributions.** References [27] and [28] by Norman L. Johnson and Samuel Kotz provide an excellent treatment of the subject of continuous distributions. The two volumes contain an extremely large collection of distributions together with lucid discussions of their properties and applications.

**Mixture Representations.** As an alternative to expressing the preceding functions in terms of special functions, one can write them as mixture representations (Luke [13] and McNolty [20]), i.e., infinite series of simpler density functions weighted by discrete probability functions. Several examples are given below. In what follows, $P(n; a)$ is the Poisson distribution on $n$ with parameter $a$, $NB(m; a, b)$ is the negative binomial distribution on $m$ with parameters $a$ and $b$ and $G(u; a, b)$ is the continuous gamma distribution for $u$ with parameters $a$ and $b$.

A. Expression (1) can be written as

\[(1) f(x; \lambda, \gamma, Q) = \sum_{m=0}^{\infty} P\left(m; \frac{\gamma^2}{4\lambda}\right) \cdot G\left(x; \frac{\lambda}{2}, Q + m\right), \quad x \geq 0.\]

B. Expression (5) becomes

\[(5) f(x; a, b; \lambda, \mu) = \sum_{m=0}^{\infty} P\left(m; \frac{b}{a}\right) \cdot G(x; a, m\mu + \lambda + 1), \quad x \geq 0.\]

C. Expression (11) is

\[(11) f(x; a, b; \nu, \mu) = \sum_{n=0}^{\infty} NB\left(n; \nu, \frac{a}{b}\right) \cdot G(x; b, \mu + \nu + n), \quad x \geq 0.\]

D. Expression (17) is given by

\[(17) f(x; a, b, c; \beta, \gamma) = \sum_{m=0}^{\infty} \sum_{n=0}^{\infty} P\left(n; \frac{c}{a}\right) \cdot NB\left(m; \beta, 1 - \frac{b}{a}\right) \cdot G(x; a, \gamma + m + n), \quad x \geq 0.\]

E. Expression (19) is

\[(19) f(x; a, b, c, d; \beta, \gamma, \lambda, \tau) = \sum_{m=0}^{\infty} \sum_{n=0}^{\infty} \sum_{r=0}^{\infty} NB\left(m; b, 1 - \frac{\lambda}{a}\right) \cdot NB\left(n; c, 1 - \frac{\tau}{a}\right) \cdot NB\left(r; d, 1 - \frac{\beta}{a}\right) \cdot G(x; a, m + n + r + \gamma), \quad x \geq 0.\]

F. Expression (21) is

\[(21) f(x; a, b, c; \gamma, \lambda, \tau) = \sum_{m=0}^{\infty} \sum_{n=0}^{\infty} NB\left(m; b, 1 - \frac{\lambda}{a}\right) \cdot NB\left(n; c, 1 - \frac{\tau}{a}\right) \cdot G(x; a, m + n + \gamma), \quad x \geq 0.\]
Other functions from Cases 1 through 19 may be written in a similar manner and, thus, a two-fold description of these densities in terms of both special functions and mixture representations can provide additional insight into their mathematical structure. Also, in performing various manipulations with the density functions one has a choice of using the special-function form or the mixture representation. One or the other might be easier to work with depending upon the problem. The extensive discussion in Chapter 9 of Luke [13] provides more generalized results than the simple expansions (1), (5), (11), (17), (19) and (21) above.

Sums of Random Variables. Many of the functions presented in Cases 1 through 19 reproduce themselves by addition of independent variables. The reproductive property holds true provided that certain of the parameters remain fixed for each variate in the sum, while other parameters need not remain the same. The fixed parameters ordinarily correspond to the location of the poles, zeros or branch points of the characteristic functions; while the "free" parameters are those which determine the order of the poles or zeros or the number of branches of the function. The characteristic functions are infinitely divisible with respect to the free parameters. Clearly, for instance, the distribution (15) is not reproduced under the addition of independent random variables.

Although the examples which follow are purely illustrative and the notation imperfect, the results indicate the application of the preceding density functions to addition problems.

The random variable \( X_0(u; \alpha, \lambda) \) will be distributed according to the gamma distribution

\[
g(u; \alpha, \lambda) = \alpha^\lambda u^{\lambda-1} e^{-\alpha u}/\Gamma(\lambda), \quad u \geq 0,
\]

while the random variables \( X_0(u; \lambda, \gamma, Q) \) and \( X_0(u; a, b; \nu, \mu) \) are distributed according to expressions (1) and (11), respectively. Similarly,

\[
X_\Phi(v; \alpha, \lambda), X_\Phi(u; a, b; c; \beta, \gamma), X_\Sigma(u; a, b; c) \quad \text{and} \quad X_\Phi(u; a, b; c; \gamma; \lambda, \tau)
\]
denote random variables distributed according to expressions (3), (17), (7) and (21), respectively. Then the following relationships hold true:

(a) For \( U = X + Y \),

\[
X_\Phi(u; a, b; \nu, \mu) = X_\Phi(x; a, \nu) + X_\Phi(y; b, \mu)
\]

where \( a, b \geq 0 \) and now \( \nu > 0 \) and \( \mu > 0 \), rather than \( \mu + \nu > 0 \).

(b) For \( V = X - Y \),

\[
X_\Phi(v; a, \nu) = X_\Phi(x; a, \nu + \frac{1}{2}) - X_\Phi(y; a, \nu + \frac{1}{2})
\]

where \( a > 0 \) and \( \nu = -\frac{1}{2} \).

(c) For \( U = X + Y \),

\[
X_\Phi(u; a, b; c; \beta, \gamma) = X_\Phi(x; 2a, 2(2c)^{1/2}, \gamma_2) + X_\Phi(y; a - b, a; \beta, \gamma_1 - \beta)
\]

where \( \gamma = \gamma_1 + \gamma_2; a > b \geq 0; c, \beta \geq 0; \gamma, \gamma_1, \gamma_2 > 0 \) and, if further, \( \gamma_1 - \beta > 0 \) then for \( U = X + Z + W \) we write
\[ X_{\Phi}(u; a, b, c; \beta, \gamma) = X_b(x; 2a, 2(2c)^{1/2}, \gamma_2) + X_s(z; a - b, \beta) + X_s(w; a, \gamma_1 - \beta). \]

(d) For \( U = X - Y, \)
\[ X_s(u; a, b, c) = X_b(x; 2, 2^{1/2}c, a) - X_b(y; 2, 2^{1/2}c, b) \]
where, of course, the appearance of a Bessel variate always permits a further resolution into sums of Bessel variates and/or gamma distributed variates.

(e) For \( U = X + Y, \)
\[ X_{\Phi}(u; a, b, c; \gamma, \lambda, \tau) = X_b(x; a - \lambda, a; b, \gamma - b - c) + X_s(y; a - \tau, c) \]
when \( c > 0 \) and \( \gamma - c > 0 \) where \( a > \lambda; a > \tau; a, b > 0; \lambda, \tau \geq 0. \)

(f) For \( U = X + Y, \)
\[ X_{\Phi}(u; a, b, c; \gamma, \lambda, \tau) = X_b(x; a - \tau, a; c, \gamma - b - c) + X_s(y; a - \lambda, b) \]
when \( b > 0 \) and \( \gamma - b > 0 \) where \( a > \lambda, a > \tau; a, c > 0; \lambda, \tau \geq 0. \)

(g) For \( U = X + Y, \)
\[ X_{\Phi}(u; a, b, c; \gamma, \lambda, \tau) = X_b(x; a - \lambda, a - \tau; b, c) + X_s(y; a, \gamma - b - c) \]
when \( b + c > 0, \gamma - b - c > 0 \) where \( a > \lambda; a > \tau; a > 0; \lambda, \tau \geq 0; \) and \( \begin{cases} b > 0 & \text{if } a - \tau > a - \lambda, \\ c > 0 & \text{if } a - \lambda > a - \tau. \end{cases} \)

(h) For \( U = X + Y + Z, \)
\[ X_{\Phi}(u; a, b, c; \gamma, \lambda, \tau) = X_b(x; a - \lambda, b) + X_s(y; a - \tau, c) + X_s(z; a, \gamma - b - c) \]
when \( b > 0, c > 0 \) and \( \gamma - b - c > 0 \) where \( \lambda, \tau \geq 0; a > \lambda, a > \tau, a > 0. \)

(i) Denote the random variable distributed according to (15) by \( X_1(x; a, b; \nu) \) then for \( U = X + Y, \)
\[ X_1(u; a, b; \nu) = X_s(x; b - a, b; \nu + \frac{1}{2}, -1) + X_s(y; b + a, \nu + \frac{1}{2}) \]
where now \( \nu > \frac{1}{2}; b > a > 0. \)

(j) Denote the random variable distributed according to (25) by \( X, \) then, for \( X = X_1 - X_2 + X_3 - X_4, \)
\[ X = X_b(x_1; 2\left( \frac{\beta}{1 + \beta} \right)^{1/2}, (2\beta)^{1/2}(1 + \beta)^{3/2}, c) \]
\[ - X_b(x_2; 2\left( \frac{\beta}{1 + \beta} \right)^{1/2}, (2\beta)^{1/2}(1 + \beta)^{3/2}, c) \]
\[ + X_s(x_3; 1, \left( \frac{\beta}{1 + \beta} \right)^{1/2}; a - c, c) - X_s(x_4; 1, \left( \frac{\beta}{1 + \beta} \right)^{1/2}; b - c, c). \]

The author would like to extend his appreciation to Lill Staley, departmental secretary of the Mathematics and Operations Research Laboratory of the Lockheed
Palo Alto Research Laboratory, for her excellent typing of this rather cumbersome text.
