A Class of Quadrature Formulas*

By Ravindra Kumar

Abstract. It is proved that there exists a set of polynomials orthogonal on \([-1, 1]\) with respect to the weight function

\[ w(t) = (1 - t^2)^{-1/2}, \]

(1)

\[ w(t) = (1 - t^2)^{1/2}, \]

(2)

\[ w(t) = ((1-t)/(1+t))^{1/2}, \]

and the generating functions and the recurrence relation are also given. Subsequently, a set of quadrature formulas given by

\[ \int_{-1}^{1} (1 + t^2)^{-1/2} (1 - t)^{p-1/2} (1 + a^2 + 2at)^{-1} f(t) dt = \sum_{n=0}^{\infty} H_n f(i_n) + E_n(f) \]

(3)

for \((p, q) = (0, 0), (0, 1)\) and \((1, 1)\) is established; these formulas are valid for analytic functions. Convergence of the quadrature rules is discussed, using a technique based on the generating functions. This method appears to be simpler than the one suggested by Davis [2, pp. 311-312] and used by Chawla and Jain [3]. Finally, bounds on the error are obtained.

1. Introduction. Szegö [1] has pointed out the possible existence of orthonormal polynomials in \([-1, 1]\) corresponding to weight functions of the kind

\[ w/\rho \]

(4)

where \(w\) is given by (2) and \(\rho\) is a polynomial satisfying certain conditions in \([-1, 1]\). A suitable choice for \(\rho\) is found to be

\[ \rho(t) = 1 + a^2 + 2at \]

(4')

which further suggests the existence of polynomials orthogonal on \([-1, 1]\) with respect to the weight function (1).

In this paper, a theorem is established which shows that the polynomials orthogonal on \([-1, 1]\) with regard to (1) are linear combinations of the polynomials which are orthogonal on \([-1, 1]\) with regard to \(w\). Particular cases of \(w\) given in (2) are of special interest and they are dealt with in detail in the following sections.

*Part of the work was carried out at the University of Lancaster, England during the period of a visiting fellowship.

Finally, the corresponding quadrature formulas are developed and their convergence is discussed by a different method. This method, depending on the use of generating functions, is a simplification of the one used in [3]. Certain lemmas are proved which are subsequently used to find bounds on the error in formulas (3).

2. Derivation of Formulas. Let \( w \) be a fixed positive, integrable function defined on \([-1,1]\) and let \( \{\psi_n\} \) be the polynomials that are orthogonal on \([-1,1]\) with regard to the weight function \( w \). Then

\[
\int_{-1}^{1} w(t)\psi_n(t)t^r dt = 0, \quad r = 0, 1, \ldots, n - 1.
\]

We propose to find the polynomial \( \phi_n \) of degree \( n \) in \( t \) such that

\[
\int_{-1}^{1} \frac{w(t)}{t-x} \phi_n(t)t^r dt = 0, \quad r = 0, 1, \ldots, n - 1,
\]

where \( x \) is a constant such that \( |x| > 1 \).

From (6) we have

\[
\int_{-1}^{1} w(t)\phi_n(t)t^r dt = 0, \quad r = 0, 1, \ldots, n - 2,
\]

\[
\int_{-1}^{1} w(t)\psi_n(t)t^r dt = 0, \quad r = 0, 1, \ldots, n - 2,
\]

\[
\int_{-1}^{1} w(t)\phi_n(t)\psi_s(t) dt = 0, \quad r = 0, 1, \ldots, n - 2.
\]

By expressing \( \phi_n \) in the form \( \sum_{r=0}^{n} a_r \psi_r \) and substituting in (7), we see that, since \( a_n \neq 0 \), we may write

\[
\phi_n = \psi_n - a_n \psi_{n-1}
\]

where \( a_n \) is some constant depending on \( n \).

Introduction of (8) in (6) with \( r = 0 \) and a little manipulation gives

\[
\alpha_n = \frac{I_n}{I_{n-1}},
\]

\[
I_n = \int_{-1}^{1} \frac{w(t)}{t-x} \psi_n(t) dt.
\]

We have thus established the following result

**Theorem 1.** Given a set of polynomials \( \{\psi_n\} \) such that

\[
\int_{-1}^{1} w(t)\psi_m(t)\psi_n(t) dt = 0, \quad m \neq n,
\]

there is defined a set of polynomials \( \{\phi_n\} \) given by

\[
\phi_n = \psi_n - \alpha_n \psi_{n-1}
\]

such that

\[
\int_{-1}^{1} \frac{w(t)}{t-x} \phi_m(t)\phi_n(t) dt = 0, \quad m \neq n,
\]

where
A CLASS OF QUADRATURE FORMULAS 771

\[ \alpha_n = \frac{I_n}{I_{n-1}}, \quad I_n = \int_{-1}^{1} \frac{w(t)}{1 - x} \psi_n(t) \, dt, \quad |x| > 1. \]

The following particular cases follow from above.

3. Case I. Let \( w(t) = (1 - t^2)^{-1/2} \) so that \( \psi_n = T_n \) is the Chebyshev polynomial of degree \( n \) of the first kind. Let

\[ x = -\frac{1}{2}(a + 1/a), \quad a \text{ being real}, \]

so that \( |x| > 1 \), whatever \( a \). With this, (10) gives

\[ I_n = 2a \int_{-1}^{1} \frac{(1 - t^2)^{-1/2}}{1 + a^2 + 2at} T_n(t) \, dt. \]

The generating function for Chebyshev polynomials can be written as

\[ \frac{1}{2} \frac{1 - w^2}{1 - 2tw + w^2} = \frac{1}{2} + \sum_{n=1}^{\infty} T_n(t)w^n, \quad |w| < 1. \]

With \( w = -1/a \), this becomes

\[ \frac{1}{1 + a^2 + 2at} = \frac{2}{a^2 - 1} \left[ \frac{1}{2} + \sum_{n=1}^{\infty} (-1)^n a^n T_n(t) \right], \quad |a| > 1. \]

Inserting this in (11), using the orthogonality property of the Chebyshev polynomials and the result

\[ \int_{-1}^{1} (1 - t^2)^{-1/2} T_n^2(t) \, dt = \frac{\pi}{2}, \quad n \geq 1, \]

we get

\[ I_n = (-1)^n a^{-n+1} \cdot \frac{2\pi}{a^2 - 1} \text{ and } \alpha_n = \frac{I_n}{I_{n-1}} = \frac{-1}{a}. \]

Thus, from (8), we get

\[ p_n = a \cdot \phi_n = aT_n + T_{n-1}, \quad n \geq 1, |a| > 1. \]

It is easy to prove that the corresponding orthonormal polynomials are

\[ p_n^* = \left( \frac{a^2 - 1}{\pi} \right)^{1/2}, \quad p_n^* = \left( \frac{2}{\pi} \right)^{1/2} [aT_n + T_{n-1}], \quad n \geq 1, \]

which satisfy the orthonormality condition

\[ \int_{-1}^{1} (1 - t^2)^{-1/2} (1 + a^2 + 2at)^{-1} p_m^*(t)p_n^*(t) \, dt = \delta_{mn}, \quad a \neq 1, m, n \geq 0, \]

and the recurrence relation

\[ p_{n+1}^*(t) = 2tp_n^*(t) - p_{n-1}^*(t), \quad n \geq 2. \]

The generating function for the Chebyshev polynomials can be written as

\[ \frac{1}{2} \frac{1 - w^2}{1 - 2tw + w^2} = \sum_{n=0}^{\infty} w^n T_n(t) = \frac{1}{2} + w \sum_{n=0}^{\infty} w^n T_{n+1}(t) = -\frac{1}{2} + \sum_{n=0}^{\infty} w^n T_n(t). \]
This gives

\[ \frac{1}{2} \frac{1 - w^2}{1 - 2tw + w^2} (a + w) = a \left[ \frac{1}{2} + w \sum_{n=0}^{\infty} w^n T_{n+1}(t) \right] + \left[ -\frac{1}{2} + \sum_{n=0}^{\infty} w^n T_n(t) \right] = \frac{a - w}{2} + \sum_{n=0}^{\infty} w^{n+1} [aT_{n+1}(t) + T_n(t)]. \]  

(15)

Insertion of (12) in (15) and a little manipulation leads to the generating function (16) for the polynomials (12)

\[ \frac{1}{2} \frac{1 - w^2}{1 - 2tw + w^2} (a + w) = \frac{a - w}{2} + \sqrt{\frac{\pi}{2}} \sum_{n=0}^{\infty} w^{n+1} p_{n+1}^*(t). \]  

(16)

Polynomials (12) give rise to the quadrature formulas

\[ \int_{-1}^{1} (1 - t^2)^{-1/2} (1 + a^2 + 2at)^{-1} f(t) dt = \sum_{k=1}^{n} H_k f(t_k) + E_n(f) \]  

(17)

which are exact for all polynomials of degree \( \leq 2n - 1 \). The weight coefficients and the error term in (17) are calculated through standard methods to be given by

\[ H_k = -2/[p_{n+1}^*(t_k)p_{n+1}^*(t_k)], \]  

(18)

and

\[ E_n(f) = \frac{\pi}{(2n)!2^n} f^{(2n)}(\xi), \quad -1 < \xi < 1, \]  

(19)

where the prime denotes the derivative and \( \{t_k\} \) are the zeros of the \( n \)th degree polynomial \( p_{n}^* \).

4. Case II. Let \( w(t) = (1 - t^2)^{1/2} \) so that \( \psi_n = U_n \) is the Chebyshev polynomial of degree \( n \) of the second kind. Following the procedure of Section 3, relations (12) to (14) become

\[ q_0^* = (2/\pi)^{1/2}, \quad q_n^* = (2/\pi)^{1/2}[aU_n + U_{n-1}], \quad n \geq 1, \]  

(20)

\[ \int_{-1}^{1} (1 - t^2)^{1/2} (1 + a^2 + 2at)^{-1} q_m^*(t)q_n^*(t) dt = \delta_{mn}, \quad a \neq 1, m, n \geq 0, \]  

(21)

\[ q_{n+1}^*(t) = 2tq_n^*(t) - q_{n-1}^*(t), \quad n \geq 2. \]  

(22)

The generating function for \( q_n^* \) can similarly be written as

\[ \frac{a + w}{1 - 2tw + w^2} = a + \sqrt{\frac{\pi}{2}} \sum_{n=0}^{\infty} w^{n+1} q_{n+1}^*(t). \]  

(23)

The corresponding quadrature formula is given by

\[ \int_{-1}^{1} (1 - t^2)^{1/2} (1 + a^2 + 2at)^{-1} f(t) dt = \sum_{k=1}^{n} H_k f(t_k) + E_n(f), \]  

where

\[ H_k = -2/[q_{n+1}^*(t_k)q_n^*(t_k)], \]  

(24)

(25)
A CLASS OF QUADRATURE FORMULAS

(26) \[ E_n(f) = \frac{\pi}{(2n)! 2^{2n+1} a^2} f^{(2n)}(\xi), \quad -1 < \xi < 1, \]
and \( \{t_k\} \) are the zeros of \( q_n^* \).

5. Case III. With \( w(t) = \sqrt{((1 - t)/(1 + t))} \) and orthonormal polynomials \( r_n^* \), the corresponding results are as follows:

\[
\begin{align*}
  r_0^* &= \frac{1}{\sqrt{\pi}} (a - 1), \quad r_1^* (t) = \frac{1}{\sqrt{\pi}} (2at + a + 1), \\
  r_n^* &= \frac{1}{\sqrt{\pi}} [a U_n + (1 + a) U_{n-1} + U_{n-2}], \quad n \geq 2.
\end{align*}
\]

(27)

\[
\begin{align*}
  \int_{-1}^{1} \left( \frac{1-t}{1+t} \right)^{1/2} (1 + a^2 + 2at)^{-1} r_n^*(t) \eta_m^*(t) dt = \delta_{mn}, \quad a \neq 1, m, n \geq 0.
\end{align*}
\]

(28)

\[
\begin{align*}
  \eta_{n+1}^*(t) &= 2r_n^*(t) - \eta_n^*(t), \quad n \geq 1.
\end{align*}
\]

(29)

\[
\frac{a + (1 + a)w + w^2}{1 - 2tw + w^2} = a + 2atw + (1 + a)w + (\pi)^{1/2} \sum_{n=0}^{w} r_{n+2}^*(t) w_n^2.
\]

The relations corresponding to (17), (18) and (19) are

\[
\begin{align*}
  \int_{-1}^{1} \left( \frac{1-t}{1+t} \right)^{1/2} (1 + a^2 + 2at)^{-1} f(t) dt &= \sum_{k=1}^{n} H_k f(t_k) + E_n(f), \\
  H_k &= -\frac{2}{\pi} \left[ r_n^*(t_k) r_{n+1}^*(t_k) \right], \\
  E_n(f) &= \frac{\pi}{(2n)! 2^{2n} a^2} f^{(2n)}(\xi), \quad -1 < \xi < 1,
\end{align*}
\]

where \( \{t_k\} \) are the zeros of \( r_n^* \).

We now discuss the convergence of the quadrature rules.

6. Case I. Let \( L \) be a closed contour enclosing the interval \([-1,1]\) in the \( z \)-plane and let the zeros of the polynomials \( p_n^* \) be denoted by \( \{t_i\} \). Application of the residue theorem to the contour integral

\[
\frac{1}{2\pi i} \int_L \frac{f(z) dz}{(z-t)p_n^*(z)}
\]
gives

\[
\begin{align*}
  f(t) &= \sum_{i=1}^{n} \frac{p_n^*(t)}{(r - t_i)p_n^*(t_i)} f(t_i) + \frac{1}{2\pi i} \int_L \frac{f(z)p_n^*(z) dz}{(z-t)p_n^*(z)},
\end{align*}
\]

assuming that \( f(z) \) is regular within \( L \).

Multiplying both sides of (34) with \((1 - t^2)^{-1/2}(1 + a^2 + 2at)^{-1}\), integrating with regard to \( t \) on \([-1,1]\) and interchanging the order of integration on the right-hand side, we get

\[
\begin{align*}
  \int_{-1}^{1} \frac{f(t) dt}{(1 - t^2)^{1/2}(1 + a^2 + 2at)} &= \sum_{i=1}^{n} \mu_i f(t_i) + E_n(f)
\end{align*}
\]

where
(36) \[ \mu_i = \frac{1}{p_n^*(t_i)} \int_{-1}^{1} \frac{p_n^*(t) \, dt}{(t - t_i)(1 - t^2)^{1/2}(1 + a^2 + 2at)} \]

and

\[ E_n(f) = \frac{1}{2\pi i} \int_L \frac{f(z) \, dz}{p_n^*(z)} \int_{-1}^{1} \frac{p_n^*(t) \, dt}{(z - t)(1 - t^2)^{1/2}(1 + a^2 + 2at)}. \]

This is the quadrature formula (3) with \((p, q) = (0, 0)\) for analytic functions with abscissas \(t_i\) and weights \(\mu_i\).

The error of the quadrature formula can be written as

\[ E_n(f) = \frac{1}{\pi i} \int_L \frac{f(z)Q_n^*(z)}{p_n^*(z)} dz \]

where

\[ Q_n^*(z) = \frac{1}{2} \int_{-1}^{1} \frac{p_n^*(t) \, dt}{(1 - t^2)^{1/2}(z - t)(1 + a^2 + 2at)} \]

is a single-valued function for all \(z\) in the plane with the interval \([-1, 1]\) deleted.

The mapping \(z = \frac{1}{4}((\xi + \xi^{-1}), \xi = \rho e^{i\theta} (0 \leq \theta \leq 2\pi)\) is now introduced which maps the exterior of the unit circle \(|\xi| = 1\) conformally onto the \(z\)-plane with the interval \([-1, 1]\) deleted. The circle \(|\xi| = \rho (\rho > 1)\) is mapped onto an ellipse \(\epsilon_\rho\) with foci at \(z = \pm 1\) and semi-axes \(\frac{1}{2}(\rho + \rho^{-1})\) and \(\frac{1}{2}(\rho - \rho^{-1})\).

7. A Lemma for \(Q_n^*(z)\). Relation (38) with \(\eta = \xi^{-1}\) now becomes

\[ Q_n^*(z) = \eta \int_{-1}^{1} \frac{p_n^*(t) \, dt}{(1 - t^2)^{1/2}(1 + a^2 + 2at)(1 - 2\eta t + \eta^2)}. \]

Relation (16) with \(\eta\) for \(w\) gives

\[ \frac{1}{1 - 2\eta t + \eta^2} = \frac{2}{(a + \eta)(1 - \eta^2)} \left\{ \frac{a - \eta}{2} + \sqrt{\frac{\pi}{2}} \sum_{n=0}^{\infty} \eta^{n+1} p_{n+1}(t) \right\}. \]

Inserting this in (39) and using the orthonormality property of the polynomials \(p_n^*\), we get

\[ Q_n^*(z) = \sqrt{2\pi} \frac{(1 - \eta^2)(a + \eta)}{(1 - 1/\xi^2)(a + 1/\xi)} \eta^{n+1} \xi^{-n-1}. \]

Hence, for \(z\) on \(\epsilon_\rho\), we have

\[ |Q_n^*(z)| \leq \frac{\sqrt{2\pi}}{(1 - 1/\rho^2)(a - 1/\rho)} \rho^{-n-1} = \frac{\sqrt{2\pi}}{(\rho^2 - 1)(ap - 1)} \rho^{2-n}. \]

We have thus proved the following lemma.

**Lemma.** For \(z\) on \(\epsilon_\rho\),

\[ |Q_n^*(z)| \leq \frac{\sqrt{2\pi}}{(\rho^2 - 1)(ap - 1)} \rho^{2-n}. \]
8. Convergence of the Quadrature Formula. Since, for $z$ on $\epsilon_\rho$, $T_n(z) = \frac{1}{2}(\xi^n + \xi^{-n})$, we have

$$|T_n(z)| \geq \frac{1}{2}(\rho^n - \rho^{-n}) \quad \text{and} \quad |T_{n-1}(z)| \leq \frac{1}{2}(\rho^{n-1} + \rho^{1-n}).$$

Also

$$p_n^*(z) = (2/\pi)^{1/2}[aT_n(z) + T_{n-1}(z)].$$

Therefore

$$|p_n^*(z)| \geq (2/\pi)^{1/2} \cdot \frac{1}{2} \cdot [a(\rho^n - \rho^{-n}) - (\rho^{n-1} + \rho^{1-n})].$$

From (37), by selecting the contour as an ellipse $\epsilon_\rho$ ($\rho > 1$), it follows that

$$|E_n(f)| \leq \frac{1}{\pi} \int_{\epsilon_\rho} \left| \frac{f(z)}{|p_n^*(z)|} \right| ds \quad (|dz| = ds).$$

Let

$$M(\rho) = \max_{z \in \epsilon_\rho} |f(z)| \quad \text{and} \quad l(\epsilon_\rho) = \text{length of } \epsilon_\rho.$$

Inserting (40), (41) and (43) in (42), we get

$$|E_n(f)| \leq \frac{2M}{\rho} \cdot \frac{\rho^{2-n}}{(\rho^2 - 1)(\rho^2 - 1)} = \frac{\rho^{2-n}}{a(\rho^n - \rho^{-n}) + (\rho^{n-1} - \rho^{1-n})}.$$ 

Thus, the following result has been established.

Theorem 2. Let $f \in A(\epsilon_\rho)$ and let $\rho > 1$. Then

$$|E_n(f)| \leq \frac{2M}{\rho} \cdot \frac{\rho^{2-n}}{(\rho^2 - 1)(\rho^2 - 1)} = \frac{\rho^{2-n}}{a(\rho^n - \rho^{-n}) + (\rho^{n-1} - \rho^{1-n})}.$$ 

9. Case II. Corresponding to $(p, q) = (1, 1)$ in formula (3), relations (35) to (39) are revised as follows:

$$\int_{-1}^{1} \frac{(1 - t^2)^{1/2}}{1 + a^2 + 2at} f(t) dt = \sum_{i=1}^{n} \mu_i f(t_i) + E_n(f),$$

$$\mu_i = \frac{1}{q^{*'}(t_i)} \int_{-1}^{1} \frac{(1 - t^2)^{1/2} q^{*}_n(t)}{(t - t_i)(1 + a^2 + 2at)} dt,$$

$$E_n(f) = \frac{1}{\pi i} \int \frac{f(z)Q^{*}_n(z)}{q^{*}_n(z)} dz,$$

$$Q^{*}_n(z) = \frac{1}{2} \int_{-1}^{1} \frac{(1 - t^2)^{1/2} q^{*}_n(t)}{(z - t)(1 + a^2 + 2at)} dt,$$

$$Q^{*}_n(z) = \eta \int_{-1}^{1} \frac{(1 - t^2)^{1/2} q^{*}_n(t)}{1 + a^2 + 2at} dt.$$ 

where $t_i$ are the zeros of $q^{*}_n$.

Inserting (23) with $\eta$ for $w$ in (49) and using the orthonormality property of the polynomials $q^{*}_n$, we get
which proves the following lemma.

Lemma. For \( z \) on \( \varepsilon_p \),

\[
|Q^*_n(z)| \leq \sqrt{\frac{\pi}{2}} \frac{\rho^{-n}}{ap - 1}.
\]  

10. Bounds on Error. Since

\[
|z_1 - z_2| \geq ||z_1| - |z_2|| \quad \text{and} \quad q^*_n(z) = (2/\pi)^{1/2}[aU_n(z) + U_{n-1}(z)]
\]

we have

\[
|q^*_n(z)| \geq (2/\pi)^{1/2}[a|U_n(z)| - |U_{n-1}(z)|].
\]

Now, for \( z \) on \( \varepsilon_p \),

\[
U_n(z) = (\xi^{n+1} - \xi^{-n-1})/(\xi - \xi^{-1}).
\]

Therefore

\[
|U_n(z)| \geq \frac{\rho^{n+1} - \rho^{-n-1}}{\rho + \rho^{-1}} \quad \text{and} \quad |U_{n-1}(z)| \leq \frac{\rho^n + \rho^{-n}}{\rho - \rho^{-1}}.
\]

Hence

\[
|q^*_n(z)| \geq \left(\frac{2}{\pi}\right)^{1/2} \left[a \frac{\rho^{n+1} - \rho^{-n-1}}{\rho + \rho^{-1}} - \frac{\rho^n + \rho^{-n}}{\rho - \rho^{-1}}\right].
\]

From (47), we have

\[
|E_n(f)| \leq \frac{1}{\pi} \int_{\varepsilon_p} \frac{|f(z)||Q^*_n(z)|}{|q^*_n(z)|} \, ds \quad (|dz| = ds).
\]

Inserting (50), (51) and (43) in (52), we get, on simplification, the following result:

Theorem 3. Let \( f \in A(\varepsilon_p) \) and let \( \rho > 1 \). Then

\[
|E_n(f)| \leq \frac{M(\rho)l(\varepsilon_p)}{2} \frac{\rho^{-n}}{ap - 1} \cdot \left(a\left(\frac{\rho^{n+1} - \rho^{-n-1}}{\rho + \rho^{-1}}\right) - \left(\frac{\rho^n + \rho^{-n}}{\rho - \rho^{-1}}\right)^{-1}\right)
\]

where \( M(\rho) \) and \( l(\varepsilon_p) \) are given by (43).

11. Case III. Corresponding to \((p, q) = (0, 1)\) in formula (3), relations (35) to (39) are revised as follows:

\[
\int_{-1}^{1} \left(\frac{1 - t}{1 + t}\right)^{1/2} (1 + a^2 + 2at)^{-1} f(t) \, dt = \sum_{i=1}^{n} \mu_i f(t_i) + E_n(f),
\]

\[
\mu_i = \frac{1}{\eta^*_n(t_i)} \int_{-1}^{1} \left(\frac{1 - t}{1 + t}\right)^{1/2} \eta^*_n(t) \, dt / (t - t_i)(1 + a^2 + 2at).
\]
\begin{align*}
(56) \quad E_n(f) &= \frac{1}{\pi i} \int \frac{f(z)Q_n^*(z)}{r_n^*(z)} \, dz, \\
(57) \quad Q_n^*(z) &= \frac{1}{2} \int_{-1}^{1} \left( \frac{1 - t}{1 + t} \right)^{1/2} \frac{r_n^*(t)}{(z - t)(1 + a^2 + 2at)} \, dt, \\
\text{where } t_i \text{ are the zeros of } r_n^*(t),
\end{align*}

\begin{align*}
(58) \quad Q_n^*(z) &= \eta \int_{-1}^{1} \left( \frac{1 - t}{1 + t} \right)^{1/2} \frac{r_n^*(t)}{1 + a^2 + 2at} \, dt \\
&= \eta \frac{a^2 + (1 + a)\xi + 1}{a^2 + (1 + a)\xi + 1},
\end{align*}

Introduction of (30) in (58), with \( \eta \) for \( w \), and the use of orthonormality property of the polynomials \( r_n^* \), we get

\begin{align*}
\left| Q_n^*(z) \right| &\leq (\pi)^{1/2} \frac{\rho^{-n+1}}{a\rho^2 - (1 + a)\rho + 1} (n > 1).
\end{align*}

12. Bounds on Error. Since

\begin{align*}
|z_1 + z_2| &\geq ||z_1| - |z_2|| \quad \text{and} \quad r_n^*(z) = (\pi)^{-1/2}[aU_n(z) + \{(1 + a)U_{n-1}(z) + U_{n-2}(z)\}]
\end{align*}

we have

\begin{align*}
|r_n^*(z)| &\geq (\pi)^{-1/2}[a|U_n(z)| - \{(1 + a)|U_{n-1}(z)| + |U_{n-2}(z)|\}].
\end{align*}

Now, for \( z \) on \( \epsilon_p \),

\begin{align*}
U_n(z) &= (\xi^{n+1} - \xi^{-n-1})/(\xi - \xi^{-1}).
\end{align*}

Therefore

\begin{align*}
|U_n(z)| &\geq \frac{\rho^{n+1} - \rho^{-n-1}}{\rho + \rho^{-1}}, \\
|U_{n-1}(z)| &\leq \frac{\rho^n + \rho^{-n}}{\rho - \rho^{-1}} \quad \text{and} \quad |U_{n-2}(z)| \leq \frac{\rho^{n-1} + \rho^{-n+1}}{\rho - \rho^{-1}}.
\end{align*}

Hence

\begin{align*}
(60) \quad |r_n^*(z)| &\geq (\pi)^{-1/2} \left[ a\frac{\rho^{n+1} - \rho^{-n-1}}{\rho + \rho^{-1}} - (1 + a)\frac{\rho^n + \rho^{-n}}{\rho - \rho^{-1}} - \frac{\rho^{n-1} + \rho^{-n+1}}{\rho - \rho^{-1}} \right].
\end{align*}

From (56) we have

\begin{align*}
(61) \quad |E_n(f)| &\leq \frac{1}{\pi} \int_{\sigma} \frac{|f(z)| \cdot |Q_n^*(z)|}{|r_n^*(z)|} \, ds \quad (|dz| = ds).
\end{align*}

Inserting (59), (60) and (43) in (61), we get, on simplification, the following result:
Theorem 4. Let $f \in A(e_{\rho})$ and let $\rho > 1$. Then

$$|E_{n}(f)| \leq \frac{M(\rho)l(e_{\rho})\rho^{-n+1}}{\rho p^2 - (1 + a)\rho + 1}$$

$$\cdot \left( a \left( \frac{\rho^{n+1} - \rho^{-n+1}}{\rho + \rho^{-1}} \right) - (1 + a) \left( \frac{\rho^{n} + \rho^{-n}}{\rho - \rho^{-1}} \right) - \left( \frac{\rho^{n+1} + \rho^{-n+1}}{\rho - \rho^{-1}} \right) \right)^{-1}.$$ (62)

13. Acknowledgements. Thanks are due to Professor M. K. Jain for encouragement and inspiration.

I am grateful to the referee for his important suggestions which improved the text and presentation of the material to the present form.

I owe sincere thanks to Professor C. W. Clenshaw and to Dr. D. Kershaw for their very useful comments and helpful discussions.
