Information for Subscribers

The journal is published quarterly in one volume per year, with issues numbered serially since Volume 1, Number 1. Subscription prices for Volume 31 (1977) are list $55.00, institutional member $39.00, individual AMS member $20.00, member of CBMS organizations $27.00. Back number prices per volume for Volumes 1–27 (1943–1973) are list $36.00, AMS member $27.00; Volumes 28–29 (1974–1975) are list $54.00, AMS member $40.50; Volume 30 (1976) are list $72.00, AMS member $54.00.

Volumes 1–30 (1943–1976) are available on 16 mm microfilm either as negatives or positives and may be mounted either on spools or in Eastman or 3M cartridges. Prices are $385.00 for spools and $403.00 for cartridges. Only current subscribers will be eligible to purchase back volumes on microfilm.

Unpublished Mathematical Tables

The editorial office of the journal maintains a repository of Unpublished Mathematical Tables (UMT). When a table is deposited in the UMT repository a brief summary of its contents is published in the section Reviews and Descriptions of Tables and Books. Upon request, the chairman of the editorial committee will supply copies of any table for a nominal cost per page.

Subscriptions and orders for publications of the American Mathematical Society should be addressed to American Mathematical Society, P. O. Box 1571, Annex Station, Providence, R.I. 02901. All orders must be accompanied by payment. Other correspondence should be addressed to P. O. Box 6248, Providence, R. I. 02940.

Information for Contributors

Manuscripts should be typewritten double-spaced in the format used by the journal. For journal abbreviations, see the latest Mathematical Reviews volume index. An author should submit the original and one copy of the manuscript and retain one copy. The author may suggest an appropriate editor for his paper. It is recommended that the author acquaint himself with the pertinent material contained in “A Manual for Authors of Mathematical Papers,” which is available from the American Mathematical Society. All contributions intended for publication and all books for review should be addressed to James H. Bramble, Chairman, Editorial Committee, Mathematics of Computation, Center for Applied Mathematics, 275 Olin Hall, Cornell University, Ithaca, New York 14853. Institutions sponsoring research reported in the journal are assessed page and microfiche charges.

Each article submitted for publication must be accompanied by a brief and reasonably self-contained abstract, and by AMS (MOS) subject classification numbers. If a list of key words and phrases is included, it will be printed as a footnote on the first page. A list of the classification numbers may be found in the Index to Mathematical Reviews, Volume 39 (June 1970).

The research journals of the American Mathematical Society carry a page charge of $40.00 per page to help defray the cost of publication. This amount is charged to the institution or to a contract supporting the research reported in the published paper. The publication charge policy of the United States Federal Council for Science and Technology (FCST) is reported on page 112 of the February, 1975 issue of the NOTICES of the American Mathematical Society. In no case is the author personally responsible for paying the page charge, nor is acceptance of the author’s paper for publication dependent upon payment of the page charge.
MATHEMATICAL DEVELOPMENTS ARISING FROM HILBERT PROBLEMS

Edited by FELIX E. BROWDER

Hilbert’s original article
Problems of present day mathematics by the Editor
Hilbert’s 1st problem: the continuum hypothesis by Donald A. Martin
What have we learnt from Hilbert’s 2nd problem? by G. Kreisel
Problem 4: Desarguesian spaces by Herbert Busemann
Hilbert’s 5th problem and related problems on transformation groups by C. T. Yang
Hilbert’s 6th problem: mathematical treatment of the axioms of physics by A. S. Wightman
Hilbert’s 7th problem: on the Gel’fond-Baker method and its applications by R. Tijdeman
Hilbert’s 8th problem: an analogue by E. Bombieri
An overview of Deligne’s proof of the Riemann hypothesis for varieties over finite fields (Problem 8) by Nicholas M. Katz
Problems concerning prime numbers (Problem 8) by Hugh L. Montgomery
Problem 9: the general reciprocity law by J. Tate
Hilbert’s 10th problem. Diophantine equations: positive aspects of a negative solution by Martin Davis, Yuri Matijasevic and Julia Robinson
Hilbert’s 11th problem: the arithmetic theory of quadratic forms by O. T. O’Meara
Some contemporary problems with origins in the Jugendtraum (Problem 12) by R. P. Langlands
The 13th problem of Hilbert by G. G. Lorentz
Hilbert’s 14th problem—the finite generation of subrings such as rings of invariants by David Mumford
Problem 15. Rigorous foundation of Schubert’s enumerative calculus by Steven L. Kleiman
Hilbert’s 17th problem and related problems on definite forms by Albrecht Pfister
Hilbert’s problem 18: on crystallographic groups, fundamental domains, and on sphere packing by J. Milnor
The solvability of boundary value problems (Problem 19) by James Serrin
Variational problems and elliptic equations (Problem 20) by Enrico Bombieri
An overview of Deligne’s work on Hilbert’s 21st problem by Nicholas M. Katz
On Hilbert’s 22nd problem by Lipman Bers
Hilbert’s 23rd problem: extensions of the calculus of variations by Guido Stampacchia

DIRICHLET DISTRIBUTION – TYPE 1
Milton Sobel, V. R. R. Uppuluri, K. Frankowski

This is the fourth volume in the series Selected Tables in Mathematical Statistics, edited by the Institute of Mathematical Statistics. The purpose of the series is to provide an outlet for tables of high quality and utility which are too long to be published in a technical journal but too short for separate publication. Each table is carefully checked for accuracy before it is accepted.

In this volume, the incomplete Type 1-Dirichlet integral is tabulated in a variety of useful forms. A rather long introductory section gives the essential properties that were used in the calculation and illustrates various ways of using tables. It also gives in Section 2 some mathematical results that are related to problems of interpolation in the table. In general, this Dirichlet integral can be used with most multinomial problems, especially those concerned with the maximum or minimum frequency in a homogeneous multinomial. Combinatorial aspects and relations to Stirling numbers of the second kind are also included; in fact these relations give rise to generalized Stirling numbers $(r > 1)$, which are listed in Table E along with the usual Stirling numbers $(r = 1)$. Table F gives exact and approximate values of $n$ needed for a multinomial selection problem described in Section 4.1, the calculation of which depended on the Type 1-Dirichlet integral.

Upon request, a brochure on the previous volumes will be sent.

GEOMETRIC ASYMPTOTICS
Victor Guillemin and Shlomo Sternberg

There has been a great deal of active research recently in the fields of symplectic geometry and the theory of Fourier integral operators. In symplectic geometry there has been much progress in understanding the geometry of dynamical systems, and the process of “quantization” as applied not only to the theory of dynamical systems, but also as a key tool in the analysis of group representations. Fourier integral operators have made possible a much more systematic analysis of the singularities of solutions of linear partial differential equations than existed heretofore, together with a good deal of geometric information associated with the spectra of such operators. These two subjects are modern manifestations of themes that have occupied a central position in mathematical thought for the past three hundred years— the relations between the wave and the corpuscular theories of light. The purpose of this book is to develop these themes, and present some of the recent advances, using the language of differential geometry as a unifying influence.

Lectures on Symplectic Manifolds

The first six sections of these notes contain a description of some of the basic constructions and results on symplectic manifolds and lagrangian submanifolds. §7, on intersections of lagrangian submanifolds, is still mostly internal to symplectic geometry, but it contains some applications to mechanics and dynamical systems. §§8, 9, and 10 are devoted to various aspects of the quantization problem. In §19 there is a feedback of ideas from quantization theory into symplectic geometry itself.

In addition to an introduction and references, the following lectures are included in these notes: Symplectic manifolds and lagrangian submanifolds, examples. Lagrangian splittings, real and complex polarizations. Kahler manifolds. Reduction, the calculus of canonical relations, intermediate polarizations. Hamiltonian systems and group actions on symplectic manifolds. Normal forms. Lagrangian submanifolds, and families of functions. Intersection Theory of lagrangian submanifolds. Quantization on cotangent bundles. Quantization and polarizations. Quantizing lagrangian submanifolds and subspaces, construction of the Maslov bundle.

NONLINEAR PROGRAMMING

Edited by

Richard W. Cottle and Carlton E. Lemke

Harold W. Kuhn, Nonlinear programming: A historical view
Garth P. McCormick, Optimality criteria in nonlinear programming
David G. Luenberger, Algorithmic analysis in constrained optimization
M. J. D. Powell, Some global convergence properties of a variable metric algorithm for minimization without exact line searches
B. Curtis Eaves, A short course in solving equations with PL homotopies
R. Tyrrell Rockafellar, Lagrange multipliers in optimization
O. L. Mangasarian, Unconstrained methods in nonlinear programming
J. E. Dennis, Jr., A brief survey of convergence results for quasi-Newton methods

These Proceedings are based on lectures delivered at the symposium on Nonlinear Programming held March 23 and 24, 1975, as part of the American Mathematical Society's annual New York meeting. This event was the ninth in a series of Symposia in Applied Mathematics jointly sponsored by the Society for Industrial and Applied Mathematics and the American Mathematical Society with financial support from the Energy Research and Development Agency (formerly the Atomic Energy Commission) and the National Science Foundation.

The organizing committee for the symposium consisted of R. W. Cottle (chairman), C. E. Lemke, S. M. Robinson, and J. B. Rosen. The committee's intent was to help bring to the attention of a larger mathematical audience some of the history, theory, applications and vigorous research activity of the Nonlinear Programming field. The editors feel that the results included in these Proceedings can be recommended as well to the worker in the field as to the interested initiate.

By WILLIAM F. AMES
A Volume in the COMPUTER SCIENCE AND APPLIED MATHEMATICS Series

All-inclusive and essentially self-contained, this volume provides an introduction to the concepts of modern numerical analysis as they apply to partial differential equations. The book first discusses problem classification and the underlying finite differences necessary to determine the proper numerical method. It then covers asymptotic concepts, convergence, stability, dimensional analysis, errors, and grid determination. The problems are divided into three groups: initial value (parabolic and hyperbolic); boundary value (elliptic); and eigenvalue (elliptic). Each section progresses from an elementary treatment of first principles through examples and the theoretical aspects to the frontiers of current research. While the book emphasizes finite difference methods, there are substantial sections on characteristics and other methods.

The second edition includes expanded coverage of fluid mechanics, explicit-implicit methods, the fast Fourier transform, Monte Carlo techniques, and fractional steps methods, as well as a new chapter on weighted residuals and finite element concepts. The number of physical and engineering examples—both linear and nonlinear—has been increased. New problems have been added, and the references have, of course, been updated.

1977, 384 pp., $16.50/£11.70 ISBN: 0-12-056760-1

Approximation Theory II
Edited by G. G. LORENTZ, C. K. CHUI and L. L. SCHUMAKER

This book contains a collection of papers presented at an International Symposium on Approximation Theory held at the University of Texas, Austin, January 18-21, 1976. The papers describe recent advances in approximation theory. There are 7 survey papers and 41 research papers. The survey papers deal with B-splines, nonlinear approximation, degree of approximation, Padé approximation, Lagrange interpolation, fitting surfaces and approximation of functions in coding theory. The research papers deal with a wide variety of topics, both abstract and applied. This book will be of value to mathematicians, computer scientists, engineers and physicists.

1976, 604 pp., $23.50/£16.70 ISBN: 0-12-455760-0
