AN ANALYSIS OF A CELL-VERTEX
FINITE VOLUME METHOD FOR A
PARABOLIC CONVECTION-DIFFUSION PROBLEM

WEN GUO AND MARTIN STYNES

ABSTRACT. We examine a cell-vertex finite volume method which is applied
to a model parabolic convection-diffusion problem. By using techniques from
finite element analysis, local errors away from all layers are obtained in a
seminorm that is related to, but weaker than, the $L^2$ norm.

1. INTRODUCTION

The cell-vertex finite volume method is a commonly used discretization scheme
for conservation laws. It has been highly successful in modelling flows in aerody-
namics. Since the method fits very naturally with convection problems, it has advan-
tageous properties for convection-diffusion problems. Nevertheless, all analyses
for cell-vertex methods have been carried out either for pure convection problems
(see, e.g., Morton and Suli [10], Suli [15, 16] and Morton and Stynes [9]), or for
convection-diffusion two-point boundary value problems (see, e.g., Mackenzie and
Morton [8] and Morton and Stynes [9]). So far, there has been no similar analysis
for a parabolic convection-diffusion problem in the literature.

In this paper, we examine a cell-vertex finite volume method when applied to
the following model time-dependent convection-diffusion problem:

\begin{align}
\tag{1.1} & Lu(x, t) = -\varepsilon u_{xx} + au_x + bu + ru_t = f(x, t) \quad \forall (x, t) \in \Omega, \\
\tag{1.2} & u(0, t) = u(1, t) = 0 \quad \text{for} \quad 0 < t \leq T, \\
\tag{1.3} & u(x, 0) = u^0(x) \quad \text{for} \quad 0 \leq x \leq 1,
\end{align}

where $0 < \varepsilon \ll a$ and $\Omega = (0, 1) \times (0, T]$. For simplicity, we assume that $a$, $b$ and $r$
are constants with

\begin{equation}
\tag{1.4} a > 0, \quad b > 0 \quad \text{and} \quad r > 0.
\end{equation}

We also assume that $f \in L_2(\Omega)$ and $u^0 \in L_2(0, 1)$.

The conditions (1.1) – (1.4) define a time-dependent convection-diffusion prob-
lem. Problems of this type arise, for example, in the modelling of steady and
unsteady viscous flow problems with large Reynolds numbers (see Peaceman and
Rachford [13] and Van Dyke [17]), convective heat transport problems with large

Peclet numbers (see Jakob [6]), oil reservoir simulation (see Ewing [4]), radioactive corrosion in the water cycles of an atomic reactor, adsorption processes in gas pipelines, spread of medicaments with the blood circulation or of plumes of poisonous industrial wastes in river systems (see Baumert et al. [2]), petroleum reservoir mechanics (see Price and Varga [14]) and electromagnetic field problems in moving media (see Hahn [5]). In (1.1), $\varepsilon$ is a diffusion coefficient and the function $a$ is a flow rate.

The differential operator in (1.1) is parabolic, but for small $\varepsilon$ its behavior might be considered as mixed parabolic-hyperbolic. The solution $u(x,t)$ will in general vary rapidly in a layer region of width $O(\varepsilon \ln(1/\varepsilon))$ at boundary $x = 1$, even for smooth initial-boundary data. This layer region is called a boundary layer. The boundary layer phenomenon has been discussed by many authors since Prandtl’s original work in 1905; see, e.g., Vishik and Lyusternik [18], Eckhaus and de Jager [3], Nayfeh [11] and O’Malley [12]. It causes serious difficulties when solving (1.1) – (1.4) numerically.

An outline of the paper is as follows. In §2 we describe the cell-vertex method for (1.1) – (1.4) and reformulate it as a finite element method. Section 3 is devoted to the derivation of a discrete Gårding inequality that guarantees the existence and uniqueness of the finite volume solution. Local errors in the $l^2$ seminorm (defined in §3) are analyzed in §4. (We note that, when restricted to certain piecewise bilinear trial spaces, this seminorm becomes a norm.) Our analysis indicates that on a general tensor product mesh, the method is first-order accurate away from all layers, in the $l^2$ seminorm. We can sharpen this result to local second-order accuracy in $l^2$, if either $\varepsilon$ is very small compared to the mesh diameter or the mesh is locally almost uniform.

Throughout the paper, we shall use $C$ to denote a generic positive constant which is independent of $\varepsilon$ and of any mesh used.

2. Description of the cell-vertex scheme

To discretize (1.1) – (1.4), we first define a partition of $\Omega$ as follows. For any pair of positive integers $N$ and $M$, we consider the arbitrary tensor product grid

$$
\Omega^h = \{(x_i, t_j) : 0 = x_0 < x_1 < \cdots < x_N = 1, 0 = t_0 < t_1 < \cdots < t_M = T\},
$$

with $h_i = x_i - x_{i-1}, k_j = t_j - t_{j-1}$ and $h = \max_{i,j}\{h_i, k_j\}$. Define the “finite volume” or “cell” $K_{i,j}$ by

$$K_{i,j} = (x_{i-1}, x_i) \times (t_{j-1}, t_j), \quad \text{for } i = 1, \ldots, N \text{ and } j = 1, \ldots, M.$$

In the finite volume context, the discretization of (1.1) is performed on each cell. The basic idea is to integrate (1.1) over a cell so that the convection and diffusion terms are converted into line integrals of normal fluxes along the cell edges, and then use the trapezoidal rule to approximate the integrals. Thus, letting $u^h$ denote
the computed solution, for cell $K_{i,j}$ we set

\begin{equation}
\int_{K_{i,j}} f(x, t) \, dx \, dt
= -\frac{\varepsilon k_{ij}}{2} \left( u_x^h(x_i, t_j) - u_x^h(x_{i-1}, t_j) + u_x^h(x_i, t_{j-1}) - u_x^h(x_{i-1}, t_{j-1}) \right) \\
+ \frac{a k_{ij}}{2} \left( u^h(x_i, t_j) - u^h(x_{i-1}, t_j) + u^h(x_i, t_{j-1}) - u^h(x_{i-1}, t_{j-1}) \right) \\
+ \frac{rh_i}{2} \left( u^h(x_i, t_j) - u^h(x_i, t_{j-1}) + u^h(x_{i-1}, t_j) - u^h(x_{i-1}, t_{j-1}) \right) \\
+ \frac{bh_i k_{ij}}{4} \left( u^h(x_i, t_j) + u^h(x_{i-1}, t_j) + u^h(x_i, t_{j-1}) + u^h(x_{i-1}, t_{j-1}) \right).
\end{equation}

With the approximation $u^h(x, t)$ parameterized by its values at the vertices, this still leaves two problems to be solved. First, how do we define $u_x^h$ at the nodes? There are several ways in which this may be done, but we consider here the so-called Method A in MacKenzie and Morton [8]. That is, we define

\begin{equation}
u_x^h(x_i, t_j) = \frac{1}{h_i + h_{i+1}} \left( u^h(x_{i+1}, t_j) - u^h(x_{i-1}, t_j) \right),
\end{equation}

for $i = 1, \ldots, N - 1$, and

\begin{equation}u_x^h(0, t_j) = \frac{2}{h_1} \left( u^h(x_1, t_j) - u^h(0, t_j) \right) - u_x^h(x_1, t_j).
\end{equation}

Similarly to (2.3), one can define $u_x^h(1, t_j)$. This solves the first problem.

The second difficulty is as follows. If we perform the discretization (2.1) on all cells, we will have a system of $N M$ equations in $(N - 1)M$ unknowns, since $u^h(x, t)$ will be prescribed on three sides of $\Omega$ by (1.2) and (1.3). We have $M$ equations too many. To obtain an exact match, we choose upwind control volumes, that is, each nodal unknown is associated with the cell upwind of it. We do this by discarding the equations associated with $K_{N,j}$ for $j = 1, \ldots, M$. We then obtain a system of equations (2.1) – (2.3), for $i = 1, \ldots, N - 1$ and $j = 1, \ldots, M$, which has exactly the same number of unknowns as that of equations. The second problem has been eliminated.

Finite volume methods are often interpreted as finite difference methods. This is reflected in the finite difference techniques used to analyze such schemes. For a scheme such as (2.1) – (2.3), which does not satisfy a discrete maximum principle, it is difficult to obtain a satisfactory finite difference analysis. Instead, we observe that the cell-vertex formulation of the finite volume method has a natural interpretation as a Petrov-Galerkin finite element method. The finite element framework then affords the possibility of applying finite element techniques to estimate errors in the finite volume method; see [10, 15, 16, 9].

To reformulate the cell-vertex finite volume scheme (2.1) – (2.3) as a finite element method, we first define our trial and test spaces. Set

$$U^h_0 = \{ v \in H^1(\Omega) \cap C(\bar{\Omega}) : v(0, t) = v(1, t) = 0 \text{ for } t \in (0, T], \}
\quad v \text{ is bilinear on each cell } K, \$$

$$M^h = \{ p \in L^2(\Omega) : p \text{ is constant on each cell } K, \}
\quad p \equiv 0 \text{ on cells } K_{N,j} \text{ for } j = 1, \ldots, M. \}$$
In order to simplify the presentation, we introduce the averaging operators $\mu, \mu_x$ and $\mu_t$, for $i = 1, \ldots, N$ and $j = 1, \ldots, M$,

\[
\mu w_{i,j} = \frac{1}{h_i k_j} \int_{K_{i,j}} w(x, t) \, dx \, dt,
\]
\[
\mu_x w_{i,j} = \frac{1}{h_i} \int_{x_{i-1}}^{x_i} w(x, t_j) \, dx,
\]
\[
\mu_t w_{i,j} = \frac{1}{k_j} \int_{t_{j-1}}^{t_j} w(x_i, t) \, dt,
\]

for all $w(x, t)$ for which the right-hand side is defined.

**Remark 2.1.** One can easily verify that for each $v \in U_0^h$ and for $i = 1, \ldots, N$ and $j = 1, \ldots, M$,

\[
(2.4) \quad \mu v_{i,j} = \frac{1}{4} (v_{i-1,j} + v_{i,j} + v_{i-1,j-1} + v_{i,j-1})
\]
\[
(2.5) \quad = \frac{1}{2} (\mu_x v_{i,j} + \mu_x v_{i,j-1})
\]
\[
(2.6) \quad = \frac{1}{2} (\mu_t v_{i,j} + \mu_t v_{i-1,j}),
\]
\[
(2.7) \quad \mu(v_x)_{i,j} = \frac{1}{h_i} (\mu_t v_{i,j} - \mu_t v_{i-1,j}),
\]
\[
(2.8) \quad \mu(v_t)_{i,j} = \frac{1}{k_j} (\mu_x v_{i,j} - \mu_x v_{i,j-1}),
\]

where $v_{i,j}$ denotes $v(x_i, t_j)$.

Now the cell-vertex finite volume approximation is defined as follows: find $u^h \in U_0^h$ satisfying

\[
(2.9) \quad \hat{B}(u^h, p) = (f, p) \quad \forall p \in \mathcal{M}^h,
\]
\[
(2.10) \quad \langle u^h(\cdot, 0), p^+ \rangle = \langle u^0, p^+ \rangle \quad \forall p \in \mathcal{M}^h,
\]

where $\langle \cdot, \cdot \rangle$ and $\langle \cdot, \cdot \rangle$ are the usual $L^2(\Omega)$ and $L^2(0,1)$ inner products,

\[
\langle p^+(x) \rangle = \lim_{t \to 0^+} p(x, t),
\]

and we set for any $(v, p) \in H^1(\Omega) \times \mathcal{M}^h$,

\[
(2.11) \quad \hat{B}(v, p) = -\varepsilon \sum_{j=1}^{M} \sum_{i=1}^{N-1} k_j \mu p_{n,j} \{ \hat{\mu}_t(v_x)_{i,j} - \hat{\mu}_t(v_x)_{i-1,j} \}
\]
\[
+ (av_x + bv_t + bv, p).
\]

Here we define, for $j = 1, \ldots, M$ and $v \in C(\Omega)$,

\[
(2.12) \quad \hat{\mu}_t(v_x)_{i,j} = \begin{cases} \frac{2}{h_i + h_{i+1}} (\mu v_{i+1,j} - \mu v_{i,j}) & \text{if } i = 1, \ldots, N - 1, \\
\frac{2}{h_i} \mu v_{i,j} - \hat{\mu}_t(v_x)_{i,j} & \text{if } i = 0. \end{cases}
\]

**Remark 2.2.** For the discretization of the diffusion term in $\hat{B}(v, p)$, we do not need nodal values of $v_x$, just its integral along two sides $x = x_{i-1}$ and $x = x_i$ of $K_{i,j}$. For $i = 1, \ldots, N - 1$, $\hat{\mu}_t(v_x)_{i,j}$ is defined by associating $\mu v_{i,j}$ with the cell center,
then taking the obvious divided difference. For \( i = 0 \), we define \( \hat{\mu}_t(v_x)_{i,j} \) by an extrapolation. It is easy to check that (2.1) – (2.3) is equivalent to (2.9) – (2.12).

In the next section, we shall demonstrate existence and uniqueness of the finite volume solution.

3. Stability and convergence

We begin our analysis of the cell-vertex finite volume scheme (2.9) – (2.12) by establishing the stability of the method in some appropriate mesh-dependent norms, which in turn implies the existence and uniqueness of the finite volume solution \( u^h \).

We introduce the following mesh-dependent norms:

\[
|v|_{l_2(\Omega^h)} = \left\{ \sum_{j=1}^{M} \sum_{i=1}^{N-1} h_i k_j |\mu v_{i,j}|^2 \right\}^{1/2},
\]

\[
|v|_{l_2(\partial_+ \Omega^h)} = \left\{ \sum_{j=1}^{N-1} k_j |\mu v_{N-1,j}|^2 + \sum_{i=1}^{N-1} h_i |\mu_x v_{i,M}|^2 \right\}^{1/2},
\]

\[
|v|_{l_2(\partial_- \Omega^h)} = \left\{ \sum_{i=1}^{N-1} h_i |\mu_x v_{i,0}|^2 \right\}^{1/2},
\]

\[
|v_x|_{l_2(\Omega^h)} = \left\{ \sum_{j=1}^{M} \sum_{i=1}^{N-1} \frac{h_i + h_{i+1}}{2} k_j |\hat{\mu}_t(v_x)_{i,j}|^2 + \frac{h_1}{4} \sum_{j=1}^{M} k_j |\hat{\mu}_t(v_x)_{0,j}|^2 \right\}^{1/2},
\]

for all \( v(x,t) \) for which the right-hand sides are defined.

Remark 3.1. We note that these norms are seminorms on \( L^2(\Omega) \). If \( |\cdot|_{l_2(\Omega^h)} \) is restricted to the subspace of \( \mathcal{U}_0^h \) defined by

\[
\{ v \in \mathcal{U}_0^h : v(x,0) = 0 \text{ for } 0 \leq x \leq 1 \},
\]

then it is a norm. The first three of these seminorms are similar to those used in Süli [16]. The last seminorm is introduced here to deal with the diffusion term.

Define a projection \( R : \mathcal{U}_0^h \rightarrow \mathcal{M}^h \) by

\[
Rv = \begin{cases} 
\mu v_{i,j} & \text{on } K_{i,j}, \text{ for } i = 1, \ldots, N - 1 \text{ and } j = 1, \ldots, M, \\
0 & \text{otherwise}.
\end{cases}
\]

The stability of the finite volume method (2.9) – (2.12) is proved by the following discrete Gårding inequality.

Theorem 3.1. Assume that \( \varepsilon \leq a(h_{N-1} + h_N) \). Then for each \( v \in \mathcal{U}_0^h \),

\[
\tilde{B}(v, Rv) \geq \frac{\varepsilon}{2} |v_x|_{l_2(\Omega^h)}^2 + b|v|^2_{l_2(\Omega^h)} + \frac{1}{4} \min\{a, r\} |v|^2_{l_2(\partial_+ \Omega^h)} - \frac{r}{2} |v|^2_{l_2(\partial_- \Omega^h)}.
\]
Proof. Recall the definition (2.11) of \( \hat{B}(\cdot, \cdot) \). For each \( v \in U_0^b \),
\[
\hat{B}(v, Rv) = -\varepsilon \sum_{j=1}^M \sum_{i=1}^{N-1} k_j \mu v_{i,j} \{ \hat{\mu}_t(v_x)_{i,j} - \hat{\mu}_t(v_x)_{i-1,j} \}
+ (av_x + rv_t + bv, Rv)
\]
(3.1)
\[
\equiv I_1 + I_2.
\]
First, by summation by parts,
\[
I_1 = \varepsilon \sum_{j=1}^M k_j \left\{ -\mu v_{N-1,j} \hat{\mu}_t(v_x)_{N-1,j} + \mu v_{1,j} \hat{\mu}_t(v_x)_{0,j} + \sum_{i=1}^{N-2} (\mu v_{i+1,j} - \mu v_{i,j}) \hat{\mu}_t(v_x)_{i,j} \right\}.
\]
(3.2)
Now we have
\[
-\mu v_{N-1,j} \hat{\mu}_t(v_x)_{N-1,j}
= (\mu v_{N,j} - \mu v_{N-1,j}) \hat{\mu}_t(v_x)_{N-1,j} - \mu v_{N,j} \hat{\mu}_t(v_x)_{N-1,j}
= \frac{h_{N-1} + h_N}{2} |\hat{\mu}_t(v_x)_{N-1,j}|^2 - \frac{1}{2} \hat{\mu}_t v_{N-1,j} \hat{\mu}_t(v_x)_{N-1,j},
\]
using (2.12), (2.6) and \( \mu_t v_{N,j} = 0 \),
\[
\geq \frac{h_{N-1} + h_N}{4} |\hat{\mu}_t(v_x)_{N-1,j}|^2 - \frac{1}{4(h_{N-1} + h_N)} |\mu_t v_{N-1,j}|^2,
\]
by the arithmetic-geometric inequality
\[
2\alpha\beta \leq \alpha^2/q + q\beta^2
\]
for all \( q > 0 \) and all \( \alpha \) and \( \beta \). Similarly, using (2.6) and \( \mu_t v_{0,j} = 0 \), we have
\[
\mu v_{1,j} \hat{\mu}_t(v_x)_{0,j}
= \frac{1}{2} \mu v_{1,j} \hat{\mu}_t(v_x)_{0,j}
= \frac{h_1}{4} (\hat{\mu}_t(v_x)_{0,j} + \hat{\mu}_t(v_x)_{1,j}) \hat{\mu}_t(v_x)_{0,j}, \quad \text{by (2.12)},
\]
\[
\geq \frac{h_1}{8} \left( |\hat{\mu}_t(v_x)_{0,j}|^2 - |\hat{\mu}_t(v_x)_{1,j}|^2 \right).
\]
Also from (2.12), for \( i = 1, \ldots, N-2 \), we obtain
\[
(\mu v_{i+1,j} - \mu v_{i,j}) \hat{\mu}_t(v_x)_{i,j} = \frac{h_i + h_{i+1}}{2} |\hat{\mu}_t(v_x)_{i,j}|^2.
\]
(3.5)
Substituting (3.3) – (3.5) into (3.2), we get
\[
I_1 \geq \varepsilon \sum_{j=1}^M k_j \left\{ \frac{h_{N-1} + h_N}{4} |\hat{\mu}_t(v_x)_{N-1,j}|^2 - \frac{1}{4(h_{N-1} + h_N)} |\mu_t v_{N-1,j}|^2
\right.
+ \frac{h_1}{8} \left( |\hat{\mu}_t(v_x)_{0,j}|^2 - |\hat{\mu}_t(v_x)_{1,j}|^2 \right)
\left. + \sum_{i=1}^{N-2} \frac{h_i + h_{i+1}}{2} |\hat{\mu}_t(v_x)_{i,j}|^2 \right\}.
\]
(3.6)
Next, we have

(3.7)

\[ I_2 = \sum_{j=1}^{M} \sum_{i=1}^{N-1} h_i k_j \mu (a v_x + r v_t + b v)_i,j \mu v_{i,j} \]

\[ = \sum_{j=1}^{M} \sum_{i=1}^{N-1} \{ a_{k,j} (\mu v_{i,j} - \mu v_{i-1,j}) + rh_i (\mu v_{i,j} - \mu v_{i,j-1}) + bh_i k_j \mu v_{i,j} \} \mu v_{i,j}, \]

by (2.7) and (2.8),

\[ = \frac{a}{2} \sum_{j=1}^{M} k_j \sum_{i=1}^{N-1} (|\mu v_{i,j}|^2 - |\mu v_{i-1,j}|^2) + \frac{r}{2} \sum_{i=1}^{N-1} h_i \sum_{j=1}^{M} (|\mu v_{i,j}|^2 - |\mu v_{i,j-1}|^2) \]

\[ + b \sum_{j=1}^{M} \sum_{i=1}^{N-1} h_i k_j |\mu v_{i,j}|^2, \]

using (2.5) and (2.6),

\[ = \frac{a}{2} \sum_{j=1}^{M} k_j |\mu v_{N-1,j}|^2 + \frac{r}{2} \sum_{i=1}^{N-1} h_i (|\mu v_{i,M}|^2 - |\mu v_{i,0}|^2) \]

\[ + b \sum_{j=1}^{M} \sum_{i=1}^{N-1} h_i k_j |\mu v_{i,j}|^2, \]

by telescoping and using \( \mu v_{0,j} = 0 \), for \( j = 1, \ldots, M \).

Hence,

\[ \mathcal{B}(v, Rv) = I_1 + I_2 \]

\[ \geq \frac{\varepsilon}{2} |v_x|^2_{L^2(\Omega^h)} + \left( \frac{a}{2} - \frac{\varepsilon}{4(h_{N-1} + h_N)} \right) \sum_{j=1}^{M} k_j |\mu v_{N-1,j}|^2 \]

\[ + \frac{r}{2} \sum_{i=1}^{N-1} h_i |\mu v_{i,M}|^2 - \frac{r}{2} |v|^2_{L^2(\partial \Omega^h)} + b |v|^2_{L^2(\Omega^h)}. \]

The desired result then follows from the assumption of the theorem.

As a corollary we obtain the following stability result.

**Theorem 3.2.** Assume that \( \varepsilon \leq a(h_{N-1} + h_N) \). Then (2.9) – (2.12) has a unique solution \( u^h \in \mathcal{U}_0^h \) and

(3.8)

\[ \varepsilon |u_x|^2_{L^2(\Omega^h)} + |u|^2_{L^2(\partial \Omega^h)} + |u^h|^2_{L^2(\partial \Omega^h)} \]

\[ \leq C \left\{ |f|^2_{L^2(\Omega^h)} + |u^0|^2_{L^2(\partial \Omega^h)} \right\}. \]

Here, \( C \) depends only on \( a, b \) and \( r \).

**Proof.** As the existence of a unique solution follows from (3.8), because we are dealing with a norm in this situation (cf. Remark 3.1), we need only establish (3.8).

Taking \( p = Ru^h \) in (2.9) and using the arithmetic-geometric inequality, we obtain

\[ \mathcal{B}(u^h, Ru^h) = \langle f, Ru^h \rangle \]

\[ \leq \frac{b}{2} |u^h|^2_{L^2(\Omega^h)} + \frac{1}{2b} |f|^2_{L^2(\Omega^h)}. \]
Now an appeal to Theorem 3.1 completes the proof.

Theorems 3.1 and 3.2 are in the spirit of results obtained in finite element analyses using standard “inf-sup” machinery; see, e.g., Babuška and Osborn [1] and the references therein.

As another corollary of Theorem 3.1 we have the following global error bound.

**Theorem 3.3.** Assume that \( \varepsilon \leq a(h_{N-1} + h_N) \). Let \( u^I \) be the interpolant from \( U_0^h \) to \( u \). Then

\[
\varepsilon \| \mu_t(u_x) - \hat{\mu}_t(u_x^h) \|_{L_2(\Omega^h)}^2 + \| u - u^h \|_{L_2(\partial_\varepsilon\Omega^h)}^2 + \| u - u^h \|_{L_2(\partial_\varepsilon\Omega^h)}^2 \\
\leq C \left\{ \varepsilon \| \mu_t(u_x) - \hat{\mu}_t(u_x^I) \|_{L_2(\Omega^h)}^2 + \| a(u - u^I) \|_{L_2(\Omega^h)}^2 \\
+ \| u - u^I \|_{L_2(\partial_\varepsilon\Omega^h)}^2 + \| u - u^I \|_{L_2(\partial_\varepsilon\Omega^h)}^2 + \| u - u^I \|_{L_2(\partial_\varepsilon\Omega^h)}^2 \right\},
\]

where

\[
(3.9)
\| \mu_t(u_x) - \hat{\mu}_t(u_x^h) \|_{L_2(\Omega^h)}^2 = \sum_{j=1}^M k_j \sum_{i=1}^{N-1} \frac{h_i + h_{i+1}}{2} \| \mu_t(u_x)_{i,j} - \hat{\mu}_t(u_x^h)_{i,j} \|_{L_2(\Omega^h)}^2 \\
+ \frac{h_1}{4} \sum_{j=1}^M k_j \| \mu_t(u_x)_{0,j} - \hat{\mu}_t(u_x^h)_{0,j} \|_{L_2(\Omega^h)}^2,
\]

and \( \| \mu_t(u_x) - \hat{\mu}_t(u_x^I) \|_{L_2(\Omega^h)}^2 \) is similarly defined.

**Proof.** Set

\[
\xi = u^h - u^I, \quad \eta = u - u^I.
\]

Then

\[
u - u^h = \eta - \xi.
\]

We begin by estimating \( \xi \).

Applying Theorem 3.1, we obtain

\[
(3.10) \quad \frac{\varepsilon}{2} |\xi|^2_{L_2(\Omega^h)} + b |\xi|^2_{L_2(\Omega^h)} + \frac{1}{4} \min\{a, r\} |\xi|^2_{L_2(\partial_\varepsilon\Omega^h)} \\
\leq B(\xi, R\xi) + \frac{r}{2} |\xi|^2_{L_2(\partial_\varepsilon\Omega^h)}.
\]

Set

\[
(3.11) \quad e_{i,j} = \mu_t(u_x)_{i,j} - \hat{\mu}_t(u_x^I)_{i,j}.
\]

From (1.1) – (1.3) and (2.9) – (2.12), we have

\[
(3.12) \quad B(\xi, R\xi) = -\varepsilon \sum_{j=1}^M k_j \mu \xi_{i,j} \{ e_{i,j} - e_{i-1,j} \} \\
+ (a\eta_x + r\eta_\| + b\eta, R\xi)
\]

and, by (2.10),

\[
(3.13) \quad |\xi|^2_{L_2(\partial_\varepsilon\Omega^h)} = |\eta|^2_{L_2(\partial_\varepsilon\Omega^h)}.
\]
We first estimate the term involving \( \epsilon \):

\[
- \epsilon \sum_{j=1}^{M} \sum_{i=1}^{N-1} k_j \mu \xi_{i,j} \{ e_{i,j} - e_{i-1,j} \}
\]

\[
= \epsilon \sum_{j=1}^{M} k_j \left\{ -\mu \xi_{N,j} e_{N-1,j} + \mu \xi_{1,j} e_{0,j} + \sum_{i=1}^{N-1} (\mu \xi_{i+1,j} - \mu \xi_{i,j}) e_{i,j} \right\},
\]

by summation by parts,

\[
= \epsilon \sum_{j=1}^{M} k_j \left\{ -\frac{1}{2} \mu \xi_{N-1,j} e_{N-1,j} + \frac{1}{2} \mu \xi_{1,j} e_{0,j} + \sum_{i=1}^{N-1} \frac{h_i + h_{i+1}}{2} \mu \xi_{i,j} e_{i,j} \right\},
\]

(3.14)

by virtue of (2.12), (2.6) and \( \mu \xi_{0,j} = \mu \xi_{N,j} = 0 \),

\[
= \epsilon \sum_{j=1}^{M} k_j \left\{ -\frac{1}{2} \mu \xi_{N-1,j} e_{N-1,j} + \frac{h_1}{4} (\hat{\mu}_t(\xi_{x})_{0,j} + \hat{\mu}_t(\xi_{x})_{1,j}) e_{0,j}
\]

\[
+ \sum_{i=1}^{N-1} \frac{h_i + h_{i+1}}{2} \hat{\mu}_t(\xi_{x})_{i,j} e_{i,j} \right\}, \text{ by (2.12)},
\]

\[
\leq \epsilon \sum_{j=1}^{M} k_j \left\{ \min_{\{a, r\}} \frac{1}{8\epsilon} |\mu \xi_{N-1,j}|^2 + C \epsilon |e_{N-1,j}|^2
\]

\[
+ \frac{h_1}{16} |\hat{\mu}_t(\xi_{x})_{0,j}|^2 + \frac{h_1}{16} |\hat{\mu}_t(\xi_{x})_{1,j}|^2 + C h_1 |e_{0,j}|^2
\]

\[
+ \frac{1}{8} \sum_{i=1}^{N-1} \frac{h_i + h_{i+1}}{2} |\hat{\mu}_t(\xi_{x})_{i,j}|^2 + 2 \sum_{i=1}^{N-1} \frac{h_i + h_{i+1}}{2} |e_{i,j}|^2 \right\}
\]

\[
\leq \frac{1}{8} \min_{\{a, r\}} \xi_{l_2(\partial, \Omega^h)}^2 + \frac{\epsilon}{4} \xi_{l_2(\partial, \Omega^h)}^2 + \frac{\epsilon}{4} \xi_{l_2(\partial, \Omega^h)}^2 + C \epsilon \left| \mu_t(u_x) - \hat{\mu}_t(u^f_x) \right|^2_{l_2(\Omega^h)},
\]

using \( \epsilon \leq a(h_{N-1} + h_N) \).

As regards the other term in (3.12), we have

\[
(3.15) \quad (a_{\eta_x} + r \eta_t + b \eta, R \xi) \leq \frac{b}{2} \xi_{l_2(\Omega^h)}^2 + C (a_{\eta_x} + r \eta_t + b \eta)_{l_2(\Omega^h)}^2.
\]

Thus, from (3.10), (3.12) – (3.15), it follows that

\[
\frac{\epsilon}{4} \xi_{l_2(\partial, \Omega^h)}^2 + \frac{b}{2} \xi_{l_2(\Omega^h)}^2 + \frac{1}{8} \min_{\{a, r\}} \xi_{l_2(\partial, \Omega^h)}^2
\]

\[
\leq C \left\{ \xi_{l_2(\partial, \Omega^h)} |\mu_t(u_x) - \hat{\mu}_t(u^f_x)|^2_{l_2(\Omega^h)} + |a_{\eta_x} + r \eta_t + b \eta|_{l_2(\Omega^h)}^2 + |\eta|_{l_2(\partial, \Omega^h)}^2 \right\}.
\]

This, together with the triangle inequality, yields the desired result. \( \square \)

4. Local Error Analysis

In this section we present local convergence results for the cell-vertex finite volume scheme (2.9) – (2.12). While the analysis is rather intricate, it ultimately shows that the scheme yields accurate results on certain subsets of \( \Omega \) where \( u \) is smooth; see Remark 4.2 below for more details.
We first derive various interpolation errors. Set
\[ I = \{(i, j) : i = 1, \ldots, N-1, j = 1, \ldots, M\}. \]

We have

**Lemma 4.1.** For any \((i, j) \in I\), assume that \(u \in C^3(K_{i,j} \cup K_{i+1,j})\). Then

\[
\begin{align*}
|\mu u_{i,j}| + |\mu (a \eta_x + r \eta_t)_{i,j}| & \leq C(h_i h_j)^{-1/2} h^2 |u|_{H^3(K_{i,j})}, \\
|\mu x \eta_{i,0}| & \leq C h^{3/2} |u_0|_{H^3(x_{i-1}, x_i)}, \\
|\mu_t (u_{x,i,j} - \hat{\mu}_t (u_{x,i,j}^f))| & \leq C \{ |h_i - h_{i+1}| u_{C^2(K_{i,j})} + (h_{i+1}^2 + h_i^2 + k_j^2) u_{C^3(K_{i,j} \cup K_{i+1,j})} \}, \\
|\mu_t (u_{x,0,j} - \hat{\mu}_t (u_{x,0,j}^f))| & \leq C \{ |h_1 - h_2| u_{C^2(K_{i,j})} + (h_2^2 + h_1^2 + k_j^2) u_{C^3(K_{i,j} \cup K_{i+1,j})} \},
\end{align*}
\]

where \(| \cdot |_{H^3(D)} \) denotes the usual seminorm on \(H^3(D)\).

**Proof.** The proof of (4.1) can be found in the proof of Theorem 4 in Morton and Suli [10]. In a similar manner one can prove (4.2).

We need only prove (4.3) and (4.4). For \(i \geq 1\), using (2.12), we have

\[
\begin{align*}
\hat{\mu}_t (u_{x,i,j}^f) & = \frac{2}{h_i + h_{i+1}} (\mu u_{t+1,i,j} - \mu u_{t,i,j}) \\
& = \frac{1}{2(h_i + h_{i+1})} (u_{i+1,j} - u_{i+1,j-1} - u_{i-1,j} - u_{i-1,j-1}), \quad \text{by (2.4)}, \\
& = \frac{1}{2} (u_{x}(x_i, t) + u_{x}(x_i, t_{j-1})) + \frac{h_{i+1} - h_i}{4} (u_{xx}(x_i, t) + u_{xx}(x_i, t_{j-1})) \\
& \quad + \frac{1}{12(h_i + h_{i+1})} \left\{ h_{i+1}^3 \left( u_{xxx}(\theta_2, t_j) + u_{xxx}(\theta_2, t_{j-1}) \right) \\
& \quad + h_i^3 \left( u_{xxx}(\theta_3, t_j) + u_{xxx}(\theta_3, t_{j-1}) \right) \right\},
\end{align*}
\]

by a Taylor expansion, where

\[ x_{i-1} < \theta_3, \theta_4 < x_i < \theta_1, \theta_2 < x_{i+1}. \]

Thus,

\[
\begin{align*}
|\mu_t (u_{x,i,j}) - \hat{\mu}_t (u_{x,i,j}^f)| & \leq \left| \frac{1}{k_j} \int_{t_{j-1}}^{t_j} u_{x}(x_i, t) \, dt - \frac{1}{2} (u_{x}(x_i, t) + u_{x}(x_i, t_{j-1})) \right| \\
& \quad + C |h_i - h| u_{C^2(K_{i,j})} + C (h_{i+1}^2 + h_i^2) u_{C^3(K_{i,j} \cup K_{i+1,j})} \\
& \leq C |h_i - h| u_{C^2(K_{i,j})} + C (h_{i+1}^2 + h_i^2 + k_j^2) u_{C^3(K_{i,j} \cup K_{i+1,j})},
\end{align*}
\]

by the error estimate for the trapezoidal rule.
Similarly, for \( i = 0 \), by a Taylor expansion about \( x = 0 \) and using \( u_{0,j} = 0 \) for all \( j \), we have
\[
\begin{align*}
\hat{\mu}_{i} (u_{x}^I)_{0,j} &= \frac{2}{h_1} \mu_{i} u_{1,j}^I - \mu_{i} (u_{x}^I)_{1,j} \\
&= \frac{1}{h_1} (u_{1,j} + u_{1,j-1}) - \frac{1}{2(h_1 + h_2)} (u_{2,j} + u_{2,j-1}) \\
&= u_{x}(0, t_j) + u_{x}(0, t_{j-1}) + \frac{h_1}{2} (u_{xx}(0, t_j) + u_{xx}(0, t_{j-1})) \\
&+ \frac{h_1^2}{6} (u_{xxx}(\theta_5, t_j) + u_{xxx}(\theta_6, t_{j-1})) \\
&- \frac{1}{2} (u_{x}(0, t_j) + u_{x}(0, t_{j-1})) - \frac{h_1 + h_2}{4} (u_{xx}(0, t_j) + u_{xx}(0, t_{j-1})) \\
&- \frac{(h_1 + h_2)^2}{12} (u_{xxx}(\theta_7, t_j) + u_{xxx}(\theta_8, t_{j-1})) \\
&= \frac{1}{2} (u_{x}(0, t_j) + u_{x}(0, t_{j-1})) + \frac{h_1 - h_2}{4} (u_{xx}(0, t_j) + u_{xx}(0, t_{j-1})) \\
&+ \frac{h_1^2}{6} (u_{xxx}(\theta_5, t_j) + u_{xxx}(\theta_6, t_{j-1})) \\
&- \frac{(h_1 + h_2)^2}{12} (u_{xxx}(\theta_7, t_j) + u_{xxx}(\theta_8, t_{j-1})) ,
\end{align*}
\]
where
\[
0 < \theta_l < x_2 \quad \text{for} \ l = 5, \ldots, 8.
\]
Hence,
\[
\begin{align*}
|\mu_{i} (u_{x})_{0,j} - \hat{\mu}_{i} (u_{x}^I)_{0,j}| &
\leq \frac{1}{h_1} \int_{t_{j-1}}^{t_j} u_{x}(0, t) \, dt - \frac{1}{2} (u_{x}(0, t_j) + u_{x}(0, t_{j-1})) \\
&+ C |h_1 - h_2| \|u\|_{C^2(K_{i,j})} + C (h_2^2 + h_1^2) \|u\|_{C^3(K_{i,j} \cup K_{i-1,j})} \\
&\leq C |h_1 - h_2| \|u\|_{C^2(K_{i,j})} + C (h_2^2 + h_1^2) \|u\|_{C^3(K_{i,j} \cup K_{i-1,j})} ,
\end{align*}
\]
which completes the proof of (4.4). \( \square \)

For each \((i, j) \in I\), define
\[
B_{i,j}(w) = -\frac{\varepsilon}{h_i} (\hat{\mu}_{i} (w_x)_{i,j} - \hat{\mu}_{i} (w_x)_{i-1,j}) + \mu (aw_x + rw_t + bw)_{i,j} ,
\]
for all \( w \) for which the right-hand side is defined. Then
\[
\hat{B}(w, p) = \sum_{j=1}^{M} \sum_{i=1}^{N-1} h_i k_j \mu p_{i,j} B_{i,j}(w) .
\]
For \( \tilde{I} \) any nonempty subset of \( I \), let \( \tilde{\Omega} = \bigcup_{(i,j) \in \tilde{I}} K_{i,j} \). Set
\[
\begin{align*}
|w|_{\hat{B}(\tilde{\Omega})} &= \left\{ \sum_{(i,j) \in \tilde{I}} h_i k_j |B_{i,j}(w)|^2 \right\}^{1/2} ,
\end{align*}
\]
License or copyright restrictions may apply to redistribution; see https://www.ams.org/journal-terms-of-use
We note that $|:\cdot|_{B(\Omega^+)}$ is a seminorm on $L^2(\Omega)$. It can be regarded as a generalization of the seminorm $|\nabla \cdot T^h(a(\cdot))|_{L^2(\Omega^+)}$ introduced in Morton and Stynes [9].

Using Lemma 4.1, we get the following error bound in a local $|:\cdot|_{B(\Omega^+)}$ seminorm.

**Theorem 4.1.** Let $\tilde{\Omega} = \bigcup_{(i,j) \in \tilde{I}} K_{i,j}$ be arbitrary. Set

$$\tilde{I} = \left\{(i,j) \in I: \ j = j' \text{ and } |i - i'| \leq 1 \text{ for some } (i',j') \in \tilde{I}\right\}.$$  

Let $\tilde{\Omega}^+ = \bigcup_{(i,j) \in \tilde{I}^+} K_{i,j}$. Assume that $u \in C^3(\tilde{\Omega}^+)$. Then

$$|u^h - u^I|_{B(\tilde{\Omega})} \leq C\varepsilon \left\{ight.\max_{(i,j) \in \tilde{I}^+} \left\{h_i^{-1}\left|h_{i+1} - h_i\right|, h_i^{-1}\left|h_i - h_{i-1}\right|\right\} \|u\|_{C^2(\tilde{\Omega}^+)} + \left.\max_{(i,j) \in \tilde{I}^+} \left\{h_{i+1}^{-1}h_i, h_i, k_j^2h_i^{-1}\right\} \|u\|_{C^2(\tilde{\Omega}^+)} + C h^2 \|u\|_{H^3(\tilde{\Omega})}\right\}.$$  

**Proof.** From (1.1), (2.9) and (2.11), we get

$$\tilde{B}\left(u^h - u^I, p\right) = -\varepsilon \sum_{j=1}^M \sum_{i=1}^{N-1} k_j \mu p_{i,j}\{e_{i,j} - e_{i-1,j}\} + (a_{i,j} \leq h_i, j, \forall p \in \mathcal{M},$$  

where $e_{i,j}$ is as in (3.11).

Fix $(i,j) \in \tilde{I}$. Take $p$ in (4.9) to be the characteristic function of $K_{i,j}$. From (4.6) this yields

$$B_{i,j}\left(u^h - u^I, p\right) = -\varepsilon h_i^{-1}\{e_{i,j} - e_{i-1,j}\} + \mu(a_{i,j} \leq h_i, j, \forall p \in \mathcal{M},$$  

Applying Lemma 4.1 gives

$$|B_{i,j}\left(u^h - u^I, p\right)| \leq C\varepsilon h_i^{-1}\left\{\left|h_{i+1} - h_i\right| + \left|h_i - h_{i-1}\right|\right\} \|u\|_{C^2(K_{i-1,j} \cup K_{i,j})} + \left(h_{i+1}^2 + h_i^2 + h_{i-1}^2 + k_j^2\right) \|u\|_{C^2(K_{i-1,j} \cup K_{i,j} \cup K_{i+1,j})} + C(h_{k_j})^{-1/2} h^2 \|u\|_{H^3(K_{i,j}),}$$  

with the convention that $h_0 = h_1$. The desired inequality follows immediately from the definition (4.7).

In what follows, we shall derive a local error bound in an energy seminorm. To this end, we introduce a cutoff function $w(x,t)$ defined by

$$\omega(x,t) = g\left(\frac{x-x^*}{\gamma h}\right)g(t-t^*),$$  

where $(x^*, t^*)$ is a fixed node, $\gamma \geq 1$ is a constant (which we choose later to be independent of $\varepsilon$ and the mesh), and

$$g(r) = \frac{2}{1 + \exp(r)} \forall r \in (-\infty, \infty).$$
Set
\[ \Omega_0 = \{(x, t) \in \Omega : x \leq x^*, \ t \leq t^* \}, \tag{4.11} \]
\[ \Omega_0^+ = \left\{(x, t) \in \Omega : x \leq x^* + s\gamma h \ln \frac{1}{h}, \ t \leq t^* + s\gamma h \ln \frac{1}{h} \right\}, \tag{4.12} \]
where \( s > 0 \) is some integer (which we choose later to be independent of \( \varepsilon \) and \( h \)). Without loss of generality, we assume that \( \Omega_0^+ \) consists of cells, that is,
\[ \Omega_0^+ = \bigcup_{j=1}^{j'} \bigcup_{i=1}^{i'} K_{i,j}, \tag{4.13} \]
for some \((i', j') \in I\). Set
\[ \Omega_0^{++} = \bigcup_{j=1}^{j'+1} \bigcup_{i=1}^{i'} K_{i,j}. \]

One can easily show that
\[ \omega_x < 0 \quad \text{and} \quad \omega_t < 0 \quad \text{on} \ \Omega, \tag{4.14} \]
\[ \max_{D_{i,j}} \omega / \min_{D_{i,j}} \omega \leq C, \quad \max_{D_{i,j}} |\omega_x| / \min_{D_{i,j}} |\omega_x| \leq C, \tag{4.15} \]
where \( D_{i,j} = K_{i,j} \cup K_{i+1,j} \),
\[ |\omega_x| \leq C\gamma^{-1} h^{-1} \omega, \tag{4.16} \]
\[ \omega(x_n, t) \leq Ch^s \quad \text{for} \ t \in [0, T], \tag{4.17} \]
and \( \omega(x, t) \geq 1 \quad \text{on} \ \Omega_0 \).

**Notation.** We introduce the following weighted norms:
\[ |v|_{L^2(\Omega_0^+, \omega)} = \left\{ \sum_{j=1}^{j'} \sum_{i=1}^{i'} h_i k_j \omega_{i,j} |\mu v_{i,j}|^2 \right\}^{1/2}, \]
\[ |v|_{L^2(\partial \Omega_0^+, \omega)} = \left\{ \sum_{i=1}^{i'} h_i |\mu v_{i,0}|^2 \right\}^{1/2}, \]
\[ |v_x|_{L^2(\Omega_0^+, \omega)} = \left\{ \sum_{j=1}^{j'} \sum_{i=1}^{i'} h_i + h_{i+1} k_j \omega_{i,j} |\mu_t (v_x)_{i,j}|^2 \right. \]
\[ \left. + \frac{h_1}{4} \sum_{j=1}^{j'} k_j \omega_{1,j} |\mu_t (v_x)_{0,j}|^2 \right\}^{1/2}, \]
for all \( v(x, t) \) for which the right-hand sides are defined.

Define \( R_\omega : U_0^h \to M^h \) by
\[ R_\omega v = \left\{ \begin{array}{ll}
\omega_{i,j} \mu v_{i,j} & \text{on} \ K_{i,j}, \text{ for } i = 1, \ldots, i', \ j = 1, \ldots, j', \\
0 & \text{otherwise}.
\end{array} \right. \]

Then we can prove a weighted Gårding inequality.
Similarly to the derivation of (3.7), we have

\[ \varepsilon \leq c_0 h_i \quad \text{for } i = 1, \ldots, i' + 1. \]

Then

\[
\dot{B}(v, R_\omega v) \geq \frac{\varepsilon}{4} |v_x|^2_{l_2(\Omega_h^+)_{\omega}} + b|v|_{l_2(\Omega_h^+)_{\omega}}^2 - \frac{r}{2} |v|^2_{l_2(\partial_+ \Omega_h^+)_{\omega}} - Ch^s h_{i' + 1}^{-1} |v|^2_{l_2(\Omega_h^+)},
\]

where \( | \cdot |_{l_2(\Omega_h^+)} \) is defined analogously to \( | \cdot |_{l_2(\Omega)} \).

**Proof.** Similarly to the derivation of (3.7), we have

\[
(\alpha v_x + rv_t + bv, R_\omega v)
\]

\[
= \frac{\alpha}{2} \sum_{j=1}^{i'} \sum_{j=1}^{i'} \sum_{j=1}^{i'} \sum_{j=1}^{i'} k_j \omega_{i,j} \left( |\mu v_i - v_{i-1}|^2 - |\mu v_{i-1}|^2 \right)
\]

\[ + \frac{r}{2} \sum_{j=1}^{i'} \sum_{j=1}^{i'} h_i \omega_{i,j} \left( |\mu v_i|^2 - |\mu v_{i-1}|^2 \right)
\]

\[ + b \sum_{j=1}^{i'} \sum_{j=1}^{i'} h_i k_j \omega_{i,j} |\mu v_i|^2 \]

\[
= \frac{\alpha}{2} \sum_{j=1}^{i'} \sum_{j=1}^{i'} \sum_{j=1}^{i'} \sum_{j=1}^{i'} k_j \left\{ \sum_{j=1}^{i'} \omega_{i,j} \left( \omega_{i,j} - \omega_{i+1,j} \right) |\mu v_i - v_{i+1}|^2 + \omega_{i+1,j} |\mu v_{i+1,j}|^2 \right\}
\]

\[ + \frac{r}{2} \sum_{j=1}^{i'} \sum_{j=1}^{i'} h_i \left\{ \sum_{j=1}^{i'} \omega_{i,j} \left( \omega_{i,j} - \omega_{i+1,j} \right) |\mu v_i - v_{i+1}|^2 + \omega_{i+1,j} |\mu v_{i+1,j}|^2 \right\}
\]

\[ + b \sum_{j=1}^{i'} \sum_{j=1}^{i'} h_i k_j \omega_{i,j} |\mu v_i|^2,
\]

by summation by parts and using \( \mu v_{i,0} = 0 \).

Next, the contribution to \( \dot{B}(v, R_\omega v) \) from the diffusion term is

\[
Q_\varepsilon \equiv -\varepsilon \sum_{j=1}^{i'} \sum_{j=1}^{i'} k_j \omega_{i,j} \mu v_i \left\{ \hat{\mu}(v_x)_{i,j} - \hat{\mu}(v_{x})_{i-1,j} \right\}
\]

\[
= \varepsilon \sum_{j=1}^{i'} k_j \left\{ -\omega_{i,j} \mu v_{i,j} \hat{\mu}(v_x)_{i,j} + \omega_{i,j} \mu v_{i,j} \hat{\mu}(v_{x})_{i,j} \right\} - \sum_{j=1}^{i'-1} \sum_{i=1}^{i'} \left( \omega_{i,j} \mu v_{i,j} - \omega_{i+1,j} \mu v_{i+1,j} \right) \hat{\mu}_t(v_{x})_{i,j},
\]

\[ + \sum_{j=1}^{i'} \sum_{j=1}^{i'} k_j \omega_{i,j} \mu v_i \left\{ \hat{\mu}(v_x)_{i,j} - \hat{\mu}(v_{x})_{i-1,j} \right\} - \sum_{j=1}^{i'-1} \sum_{i=1}^{i'} \left( \omega_{i,j} \mu v_{i,j} - \omega_{i+1,j} \mu v_{i+1,j} \right) \hat{\mu}_t(v_{x})_{i,j},
\]

where \( \hat{\mu} \) and \( \hat{\mu}_t \) are defined similarly to \( \mu \) and \( \mu_t \).
Now, analogously to (3.3), we have

\[ -\mu v_{i',j} \hat{\mu}_t(v_x) v_{i',j} \geq \frac{h_{i'} + h_{i'+1}}{4} |\hat{\mu}_t(v_x)v_{i',j}|^2 - \frac{1}{h_{i'} + h_{i'+1}} |\mu v_{i'+1,j}|^2. \]  

(4.22)

For \( i = 1, \ldots, i' - 1, \)

\[ -(\omega_{i,j} \mu v_{i,j} - \omega_{i+1,j} \mu v_{i+1,j}) \hat{\mu}_t(v_x)_{i,j} = \{ \omega_{i,j} (\mu v_{i+1,j} - \mu v_{i,j}) - (\omega_{i,j} - \omega_{i+1,j}) \mu v_{i+1,j} \} \hat{\mu}_t(v_x)_{i,j} \]

\[ = \frac{h_i + h_{i+1}}{2} \omega_{i,j} |\hat{\mu}_t(v_x)_{i,j}|^2 - (\omega_{i,j} - \omega_{i+1,j}) \mu v_{i+1,j} \hat{\mu}_t(v_x)_{i,j}, \quad \text{by (2.12),} \]

\[ \geq \frac{h_i + h_{i+1}}{4} \omega_{i,j} |\hat{\mu}_t(v_x)_{i,j}|^2 - \frac{1}{h_i + h_{i+1}} (\omega_{i,j} - \omega_{i+1,j})^2 \omega_{i,j}^{-1} |\mu v_{i+1,j}|^2. \]

Substituting (4.22), (3.4) and (4.23) into (4.21), we obtain

\[ Q_{\varepsilon} \geq \varepsilon \sum_{j=1}^{j'} k_j \left\{ \frac{h_{i'} + h_{i'+1}}{4} \omega_{i',j} |\hat{\mu}_t(v_x)_{i',j}|^2 - \frac{1}{h_{i'} + h_{i'+1}} \omega_{i',j} |\mu v_{i'+1,j}|^2 \right. \]

\[ + \frac{h_i}{8} \omega_{1,j} (|\hat{\mu}_t(v_x)_{0,j}|^2 - |\hat{\mu}_t(v_x)_{1,j}|^2) + \sum_{i=1}^{i' - 1} \frac{h_i + h_{i+1}}{4} \omega_{i,j} |\hat{\mu}_t(v_x)_{i,j}|^2 \]

\[ - \sum_{i=1}^{i' - 1} \frac{1}{h_i + h_{i+1}} (\omega_{i,j} - \omega_{i+1,j})^2 \omega_{i,j}^{-1} |\mu v_{i+1,j}|^2 \} \]

\[ \geq \varepsilon \sum_{j=1}^{j'} k_j \omega_{i',j} |\mu v_{i'+1,j}|^2 \]

\[ - \varepsilon \sum_{j=1}^{j'} k_j \sum_{i=1}^{i' - 1} \frac{1}{h_i + h_{i+1}} (\omega_{i,j} - \omega_{i+1,j})^2 \omega_{i,j}^{-1} |\mu v_{i+1,j}|^2. \]

In (4.24), we can bound the second term by using (4.17), to get

\[ \frac{\varepsilon}{h_{i'} + h_{i'+1}} \sum_{j=1}^{j'} k_j \omega_{i',j} |\mu v_{i'+1,j}|^2 \]

\[ \leq C \frac{\varepsilon}{h_{i'} + h_{i'+1}} \sum_{j=1}^{j'} k_j |\mu v_{i'+1,j}|^2 \]

\[ \leq Ch^{\alpha - 1} |v|_{l^2(\Omega_0^+)}^2, \]

using (4.19).
As for the last term in (4.24), using (2.6) and \((a + b)^2 \leq 2(a^2 + b^2)\), we get (4.26)
\[
\sum_{i=1}^{i'-1} \frac{1}{h_i + h_{i+1}} (\omega_{i,j} - \omega_{i+1,j})^2 \omega_{i,j}^{-1} |\mu v_{i+1,j}|^2 \\
\leq \frac{1}{2} \sum_{i=1}^{i'-1} \frac{1}{h_i + h_{i+1}} h_i^2 \max_{K_{i+1,j}} |\omega_x|^2 \omega_{i,j}^{-1} (|\mu v_{i,j}|^2 + |\mu v_{i+1,j}|^2) \\
\leq C \sum_{i=1}^{i'-1} \frac{h_i^2}{h_i + h_{i+1}} \gamma^{-1} h_{i+1} \max_{K_{i+1,j}} |\omega_x| (|\mu v_{i,j}|^2 + |\mu v_{i+1,j}|^2),
\]
using (4.16) and (4.15),
\[
\leq C \gamma^{-1} \sum_{i=1}^{i'-1} \max_{K_{i+1,j}} |\omega_x| (|\mu v_{i,j}|^2 + |\mu v_{i+1,j}|^2) \\
\leq C \gamma^{-1} \sum_{i=1}^{i'-1} \left( \max_{K_{i+1,j}} |\omega_x| + \max_{K_{i,j}} |\omega_x| \right) |\mu v_{i,j}|^2 \\
\leq C \gamma^{-1} \sum_{i=1}^{i'-1} \left( \max_{K_{i+1,j}} |\omega_x| \right) \min_{K_{i+1,j}} |\omega_x| \frac{1}{h_{i+1}} (\omega_{i,j} - \omega_{i+1,j}) |\mu v_{i,j}|^2,
\]
since (4.14) implies that \(\omega_{i,j} - \omega_{i+1,j} > 0\),
\[
\leq C \gamma^{-1} \sum_{i=1}^{i'-1} \frac{1}{h_{i+1}} (\omega_{i,j} - \omega_{i+1,j}) |\mu v_{i,j}|^2, \quad \text{using (4.15),}
\]
\[
\leq \frac{a}{2c_0} \sum_{i=1}^{i'-1} \frac{1}{h_{i+1}} (\omega_{i,j} - \omega_{i+1,j}) |\mu v_{i,j}|^2.
\]
on choosing \(\gamma\) sufficiently large, independently of \(\varepsilon\) and of the mesh used.

Thus, from (4.24) – (4.26) and (4.19), we obtain
\[
Q_{\varepsilon} \geq \frac{\varepsilon}{4} |w|_{l_2(\Omega_0^+)}^2 - \frac{a}{2} \sum_{j=1}^{j'-1} k_j \sum_{i=1}^{i'-1} (\omega_{i,j} - \omega_{i+1,j}) |\mu v_{i,j}|^2 - C h^s h_{i+1}^{-1} |v|_{l_2(\Omega_0^+)}^2.
\]
Combine this with (4.20) and use (4.14) to complete the proof. \(\square\)

We now prove the main result of this section.

**Theorem 4.2.** Assume that \(\varepsilon \leq \alpha (h_{N-1} + h_N)\) and that (4.19) holds. If \(u \in C^3(\Omega_0^+),\) then
\[
|u - u^h|_{E(\Omega_0)} \leq C h \left( \|u\|_{C^3(\Omega_0^+)} + |u^0|_{H^2(0, x)} \right) \\
+ C \left( h^s h_{-1}^{-1} \right)^{1/2} \left( \|f\|_{L^2(\Omega)} + \|u^0\|_{L^2(0, 1)} + |u|_{H^2(\Omega_0^+)} \right),
\]
where \(\Omega_0\) and \(\Omega_0^+\) are as in (4.11) and (4.13) respectively, \(s\) is as in (4.12), and
\[
|u - u^h|_{E(\Omega_0)} = \left\{ \varepsilon |\mu(u_x) - \tilde{\mu}(u_x^h)|_{l_2(\Omega_0)}^2 + |u - u^h|_{l_2(\Omega_0)}^2 \right\}^{1/2}
\]
with \(|\tilde{\mu}(u_x) - \mu(u_x^h)|_{l_2(\Omega_0)}\) and \(|\cdot|_{l_2(\Omega_0)}\) defined similarly to (3.9) and \(|\cdot|_{l_2(\Omega_0)}\).
Proof. Applying Lemma 4.2, we obtain
\begin{equation}
\frac{\varepsilon}{4} |\xi|_{L^2(\Omega^+)}^2 + b|\xi|_{L^2(\Omega^+)}^2 \\
\leq \hat{B}(\xi, R_\omega) + \frac{r}{2} |\xi|_{L^2(\partial \cdot \Omega^+)}^2 + C h^2 h_\nu^{-1} |\xi|_{L^2(\Omega^+)}^2.
\end{equation}
(4.27)

Recalling (4.6), we obtain
\begin{equation}
\hat{B}(\xi, R_\omega) = \sum_{j=1}^{j'} \sum_{i=1}^{i'} h_i k_j \omega_{i,j} \mu_{i,j} B_{i,j}(\xi)
\leq \frac{b}{2} |\xi|_{L^2(\Omega^+)}^2 + \frac{1}{2b} \sum_{j=1}^{j'} \sum_{i=1}^{i'} h_i k_j \omega_{i,j} |B_{i,j}(\xi)|^2.
\end{equation}
(4.28)

Put this into (4.27) to get
\begin{equation}
\frac{\varepsilon}{2} |\xi|_{L^2(\Omega^+)}^2 + b|\xi|_{L^2(\Omega^+)}^2 \\
\leq \frac{1}{b} \sum_{j=1}^{j'} \sum_{i=1}^{i'} h_i k_j \omega_{i,j} |B_{i,j}(\xi)|^2 + r |\xi|_{L^2(\partial \cdot \Omega^+)}^2 + C h^2 h_\nu^{-1} |\xi|_{L^2(\Omega^+)}^2
\leq C \left( |\xi|_{L^2(\Omega^+)}^2 + |\xi|_{L^2(\partial \cdot \Omega^+)}^2 \right) + C h^2 h_\nu^{-1} |\xi|_{L^2(\Omega^+)}^2,
\end{equation}
(4.29)

since \( \omega(x, t) \leq 2 \) on \( \Omega \), where \( \cdot |_{L^2(\partial \cdot \Omega^+)} \) is defined similarly to \( \cdot |_{L^2(\partial \cdot \Omega^+)} \).

Appealing to Theorem 4.1, we obtain
\begin{equation}
|\xi|_{L^2(\Omega^+)} \leq C \varepsilon \max_{1 \leq i \leq i'} \left\{ \max_{1 \leq i \leq i'} \left\{ \left| h_{i+1} - h_{i} \right| \right\} \| u \|_{C^2(\Omega^+)} + h^2 \| u \|_{C^3(\Omega^+)} \right\}
\leq C h^2 \| u \|_{H^2(\Omega^+)}
\end{equation}
(4.30)

using (4.19).

By (2.10),
\begin{equation}
|\xi|_{L^2(\partial \cdot \Omega^+)} = |\eta|_{L^2(\partial \cdot \Omega^+)} \leq C h^2 \| u^0 \|_{H^3(0, x, t)},
\end{equation}
(4.31)

by virtue of (4.2).

For the last term in (4.29), we have
\begin{equation}
|\xi|_{L^2(\Omega^+)} \leq |w|_{L^2(\Omega^+)} + |u|_{L^2(\Omega^+)} + |\eta|_{L^2(\Omega^+)}
\leq C \left( |f|_{L^2(\Omega^+)} + |u^0|_{L^2(\Omega^+)} + |u|_{L^2(\Omega^+)} \right) + C^2 \| u \|_{H^2(\Omega^+)}
\end{equation}

according to Theorem 3.2 and (4.1).

Clearly, for any \( w \in L^2(\Omega) \),
\begin{equation}
|w|_{L^2(\Omega^+)} \leq |w|_{L^2(\Omega^+)} \leq \| w \|_{L^2(\Omega)},
\end{equation}

by a Cauchy-Schwarz inequality. Also,
\begin{equation}
\| u \|_{L^2(\Omega)} \leq C \left( \| f \|_{L^2(\Omega)} + \| u^0 \|_{L^2(0, 1)} \right).
\end{equation}
Thus,

\begin{equation}
(4.32) \quad |\xi|_{L^2(\Omega^{+}_{\varepsilon})} \leq C \left( \|f\|_{L^2(\Omega)} + \|u^0\|_{L^2(0, 1)} \right) + Ch^2|u|_{H^3(\Omega^{+}_{\varepsilon})}.
\end{equation}

Collecting (4.30) - (4.32) into (4.29) yields

\begin{equation}
(4.33) \quad \left\{ \varepsilon|\xi|^2_{L^2(\Omega^{+}_{\varepsilon}), \omega} + \|\xi\|^2_{L^2(\Omega^{+}_{\varepsilon}), \omega} \right\}^{1/2}
\leq Ch\|u\|_{C^3(\Omega^{+}_{\varepsilon})} + Ch^2|u^0|_{H^3(0, x_r)}
+ C \left( h^s h_{r+1}^{-1} \right)^{1/2} \left( \|f\|_{L^2(\Omega)} + \|u^0\|_{L^2(0, 1)} + |u|_{H^3(\Omega^{+}_{\varepsilon})} \right).
\end{equation}

Note that by (4.18),

\begin{equation}
(4.34) \quad \varepsilon|\xi|^2_{L^2(\Omega^{+}_{\varepsilon})} + |\xi|^2_{L^2(\Omega^{+}_{\varepsilon}), \omega} \leq \varepsilon|\xi|^2_{L^2(\Omega^{+}_{\varepsilon}), \omega} + |\xi|^2_{L^2(\Omega^{+}_{\varepsilon}), \omega}.
\end{equation}

Combining (4.33) with (4.34), invoking the triangle inequality and using Lemma 4.1, we obtain the desired result. \qed

\textbf{Remark 4.1.} The assumption that \( u \in C^3(\Omega^{+}_{\varepsilon}) \) in Theorem 4.2 can be guaranteed if the data is sufficiently smooth and satisfies certain compatibility conditions at the corner \((0, 0)\) of \( \Omega \); see Ladyženskaja et al. [7].

\textbf{Corollary 4.1.} Assume that the hypotheses of Theorem 4.2 hold and

\begin{equation}
(4.35) \quad h_{i+1} = h_i + O(h^2) \quad \text{for} \ i = 1, \ldots, i'
\end{equation}

and

\begin{equation}
(4.36) \quad h_{i'+1} = O(h^\kappa) \quad \text{for some} \ \kappa > 0.
\end{equation}

Then

\begin{equation}
\left|u - u^h\right|_{E(\Omega_{\varepsilon})} \leq Ch^2 \left( \|u\|_{C^3(\Omega^{+}_{\varepsilon})} + |u^0|_{H^3(0, x_r)} + \|f\|_{L^2(\Omega)} + \|u^0\|_{L^2(0, 1)} \right).
\end{equation}

\textbf{Proof.} By inspecting the proof of Theorem 4.2, we see (cf. (4.30)) that when (4.35) holds, then

\begin{equation}
(4.37) \quad |\xi|_{H^1(\Omega^{+}_{\varepsilon})} \leq Ch^2\|u\|_{C^3(\Omega^{+}_{\varepsilon})}.
\end{equation}

Hence from (4.29), (4.37), (4.31) and (4.32), we have

\begin{equation}
(4.38) \quad \left\{ \varepsilon|\xi|^2_{L^2(\Omega^{+}_{\varepsilon}), \omega} + \|\xi\|^2_{L^2(\Omega^{+}_{\varepsilon}), \omega} \right\}^{1/2}
\leq Ch^2 \left( \|u\|_{C^3(\Omega^{+}_{\varepsilon})} + |u^0|_{H^3(0, x_r)} \right)
+ C \left( h^s h_{r+1}^{-1} \right)^{1/2} \left( \|f\|_{L^2(\Omega)} + \|u^0\|_{L^2(0, 1)} + |u|_{H^3(\Omega^{+}_{\varepsilon})} \right).
\end{equation}

Since (4.36) implies \( h_{i'+1} = O(h^{-\kappa}) \), we take \( s = \kappa + 4 \) in (4.38). Now arguments exactly the same as in the proof of Theorem 4.2 lead to the desired result. \qed

\textbf{Corollary 4.2.} Assume that the hypotheses of Theorem 4.2 hold and that there exists a positive constant \( c_1 \), which is independent of \( \varepsilon \) and of the mesh, such that

\begin{equation}
(4.39) \quad \varepsilon \leq c_1 h^2_i \quad \text{for} \ i = 1, \ldots, i'+1.
\end{equation}

Then

\begin{equation}
\left|u - u^h\right|_{E(\Omega_{\varepsilon})} \leq Ch^2 \left( \|u\|_{C^3(\Omega^{+}_{\varepsilon})} + |u^0|_{H^3(0, x_r)} + \|f\|_{L^2(\Omega)} + \|u^0\|_{L^2(0, 1)} \right).
\end{equation}
Proof. From the proof of Lemma 4.2, we see that when (4.39) holds, one can get (cf. (4.25)), for each \( v \in \mathcal{U}_h^0 \),
\[
\tilde{B}(v, R_s v) \geq \frac{\varepsilon}{4} |\xi|_{l_2(\omega_j^+)}^2 + b|v|_{l_2(\omega_j^+)}^2 - \frac{r}{2} |v|_{l_2(\partial \omega_j^+)}^2 - C h^s |v|_{l_2(\omega_j^+)}^2.
\]
Hence, similarly to the derivation of (4.29), using (4.28), we obtain
\[
\frac{\varepsilon}{2} |\xi|_{l_2(\omega_j^+)}^2 + b|\xi|_{l_2(\omega_j^+)}^2
\]
(4.40)
\[
\leq \frac{1}{b} \sum_{j=1}^{J'} \sum_{i=1}^{J} h_i k_j \omega_{i,j} |B_{i,j}(\xi)|^2 + r|\xi|_{l_2(\partial \omega_j^+)}^2 + C h^s |\xi|_{l_2(\omega_j^+)}^2.
\]
Also, from (4.30) we see that (4.39) implies (4.37). It then follows from (4.40), (4.37), (4.31) and (4.32) that
\[
\left\{ \varepsilon |\xi|_{l_2(\omega_j^+)}^2 + |\xi|_{l_2(\omega_j^+)}^2 \right\}^{1/2}
\]
\[
\leq C \left( \|u\|_{C^3(\omega_j^+)}^2 + |u_v|_{H^3(0, x_v)}^2 \right) + C h^{s/2} \left( \|f\|_{L^2(\omega)} + \|u\|_{H^3(0, 1)} + |u|_{H^3(\omega_j^+)} \right).
\]
Choose \( s = 4 \) and follow the same argument as in the proof of Theorem 4.2 to complete the proof. \( \square \)

Remark 4.2. The assumption (4.19) is reasonable, since we are interested in the singularly perturbed case. Theorem 4.2 tells us that under this assumption, away from any layers, the scheme (2.9) – (2.12) on an arbitrary tensor product mesh is first-order accurate in the \( l_2 \) seminorm, as one can choose \( s \) sufficiently large to make the term \( C h^s h_{\omega_j^+}^{-1} \) negligible. Corollary 4.1 indicates that if we work with an almost uniform mesh, then the method becomes second-order accurate in smooth regions. Corollary 4.2 shows that when the diffusion parameter \( \varepsilon \) is relatively small, the method is second-order accurate on any general tensor product mesh, away from any layers. Nevertheless, this \( l_2 \) seminorm is of course not strong enough to exclude checkerboard oscillations from the computed solution.
