OPTIMAL CONVERGENCE
FOR THE FINITE ELEMENT METHOD
IN CAMPANATO SPACES

GEORG DOLZMANN

ABSTRACT. We prove a priori estimates and optimal error estimates for linear finite element approximations of elliptic systems in divergence form with continuous coefficients in Campanato spaces. The proofs rely on discrete analogues of the Campanato inequalities for the solution of the system, which locally measure the decay of the energy. As an application of our results we derive $W^{1,p}$-estimates and give a new proof of the well-known $W^{1,\infty}$-results of Rannacher and Scott.

1. INTRODUCTION

In this paper, we present a new approach to a priori estimates and error estimates for finite element solutions of linear elliptic systems of second order with continuous coefficients. Our results rely on an extension of the by now classical Campanato space methods in elliptic theory, which provide a powerful tool to prove regularity based on $L^2$ estimates rather than on an investigation of the fundamental solution. Estimates in the energy norm follow naturally from the variational structure of the problem.

We consider the elliptic system
\begin{equation}
- \text{div}(ADu) = - \text{div} F \quad \text{in } \Omega,
\end{equation}
where $u \in W^{1,2}_0(\Omega; \mathbb{R}^m)$ and $A$ satisfies the Legendre-Hadamard condition (see Sections 2 and 3 for the notation used in the introduction). Assume that $u_h \in S^h_0(\Omega_h)$ is a solution of the corresponding weak formulation
\begin{equation}
 a(u_h, \psi_h) = \int_{\Omega} FD\psi_h \, dx \quad \forall \psi_h \in S^h_0(\Omega_h),
\end{equation}
where $S^h_0(\Omega_h)$ is the space of piecewise affine and globally continuous functions on a quasiuniform triangulation $\Omega_h$ of $\Omega$ and $a(\cdot, \cdot)$ is the bilinear form associated with $A$. Our first result concerns a priori estimates for $Du_h$ in Morrey and Campanato spaces. In particular we prove the following bound on $Du_h$ in the Campanato space $L^{2,n}$ which is isomorphic to the space of functions of bounded mean oscillation studied in \cite{JN}:

Theorem 1.1. Assume that $\Omega$ is smooth, $A \in C^{0,\sigma}$ for some $\sigma > 0$, and $F \in L^2(\Omega)$. Then $Du_h \in L^{2,n}(\Omega)$, and we have the a priori estimate

\[ \|Du_h\|_{L^{2,n}(\Omega_h)} \leq c_o \left( \|u_h\|_{2;\Omega_h} + \|F\|_{L^{2,n}(\Omega_h)} \right). \]

The second main result is the following error estimate for the gradient of the finite element solution $u_h$.

Theorem 1.2. Assume that $\Omega$ is smooth, $A \in C^{0,\sigma}$, and the system (1.1) has a unique solution. Let $F \in L^{2,n}(\Omega)$ and define $e_h = u - u_h$. Then

\[ \|De_h\|_{L^{2,n}(\Omega_h)} \leq c_o \inf_{w_h \in S_h} \|Du - Dw_h\|_{L^{2,n}(\Omega_h)}. \]

The importance of estimates in $L^{2,n}$ arises from the fact that this space is a natural substitute for $L^\infty$ in many results in real analysis. For example, if the system has a unique solution, Stampacchia’s interpolation theorem [St] immediately implies the following $W^{1,p}$ estimate:

Theorem 1.3. Assume that $\Omega$ is smooth, $A \in C^{0,\sigma}$ for some $\sigma > 0$, and the system (1.1) has a unique solution. Let $F \in L^p(\Omega)$ with $p \in (2, \infty)$. Then $Du_h \in L^p(\Omega)$, and we have the a priori estimate

\[ \|Du_h\|_{L^p(\Omega_h)} \leq c_p \|F\|_{L^p(\Omega_h)} \]

as well as the error estimate

\[ \|De_h\|_{L^p(\Omega_h)} \leq c_p \inf_{w_h \in S_h} \|Du - Dw_h\|_{L^p(\Omega_h)}. \]

As a further application of the $L^{2,n}$–estimates we show in Section 7 how one can obtain optimal $W^{1,\infty}$–estimates for $e_h$, thus generalizing the famous result by Rannacher and Scott and the recent results in [SW2] to systems. This approach allows one to obtain uniform estimates by exploiting the variational structure of the problem, and does not rely on the weighted norm techniques first developed in [Na].

There exists an extensive literature on error estimates for finite element methods in various spaces. The question of whether optimal convergence holds in $W^{1,\infty}$ has been open for a long time and was finally solved by Rannacher and Scott in [RS]. Blum, Lin and Rannacher [BLR] showed in addition that in general the error $u - u_h$ is not of order $O(h^2)$ in $L^\infty$ even if the data are smooth. The spaces $L^{2,n}$ were used in [R] to prove optimal estimates for $De_h$ up to a logarithmic factor, and in [Du2] to show optimal convergence for $e_h$ of order $O(h^2)$ in two dimensions. General results in Orlicz spaces can be found in [Du1]. Schauder estimates for higher order methods have been analyzed in [Ni], while a discussion of properties of solutions of elliptic equations based on DeGiorgi’s ideas has been carried out in [AC].

The paper is organized as follows. In Sections 2 and 3 we introduce our notation and summarize the basic results needed in the subsequent sections. We derive an analogue of the Campanato inequalities for the finite element solution in the interior situation in Section 4, while the boundary situation is analyzed in Section 5. These estimates allow us to obtain the a priori estimates and the error estimates in Section 6, and uniform estimates are given in Section 7. Finally, the Appendix gives the proofs of some well-known results in elliptic theory.

While carrying out this programme, we shall state explicitly the necessary assumptions on the coefficients and the domain $\Omega \subset \mathbb{R}^n$ which ensure that the solution
has the required regularity; that regularity theory for elliptic systems is more subtle than for elliptic equations can already be seen from the fact that there is no analogue of DeGiorgi’s famous C^{0,σ} regularity result for equations with L∞ coefficients. In addition, Gårding’s inequality does not hold for L∞ coefficients, see [Zh]. The approach towards regularity pursued here is unfortunately based on Hölder continuity of the coefficients. We therefore do not recover the general estimates in [BS] for equations in the scalar case.

2. Preliminaries

Let Ω ⊂ R^n be a convex, open and bounded domain and define Ω(x₀, R) = B(x₀, R) ∩ Ω. The convexity assumption is not related to regularity properties of the solution; in the scalar case it implies the square integrability of the second derivatives; it only avoids extending the coefficients outside of Ω. For methods to treat nonconvex domains, see e.g. [SW1]. We say that Ω is a domain of class C^{k,σ} if for all x₀ ∈ ∂Ω there exists a diffeomorphism γ ∈ C^{k,σ}(B_R⁺; R^n) which maps B_R⁺ onto Ω(x₀, R) and Γ_R onto ∂Ω(x₀, R) ∩ ∂Ω. Here B_R⁺ = {x ∈ R^n : |x| < R, x_n > 0} and Γ_R = {x ∈ R^n : |x| < R, x_n = 0}. We say that T_h is a quasiumiform triangulation of Ω with n-simplices T if there exist constants σ₀, σ₁ > 0 independent of h such that for each T ∈ T_h there exist balls B(x₀, σ₀h) and B(x₁, σ₁h) with B(x₀, σ₀h) ⊂ T ⊂ B(x₁, σ₁h) (see [C] for details). Moreover we assume that all nodes in ∂Ω_h are contained in ∂Ω. If Ω is a domain of class C^{1,σ}, then dist(x₀, ∂Ω) ≤ ch^{1+σ} for all x₀ ∈ ∂Ω_h, where c is independent of h. For a given triangulation T_h we define S^h(Ω_h) as the space of all globally continuous functions which are affine on the simplices T ∈ T_h, and we denote by S^h_0 the subspace of all functions in S^h whose trace on ∂Ω_h is zero. We use the standard notation for the Lebesgue spaces L^p, the Sobolev spaces W^{k,p} and the Hölder spaces C^{k,σ} with norms ∥·∥_{L^p(Ω)}, ∥·∥_{W^{k,p}(Ω)} and ∥·∥_{C^{k,σ}(Ω)}, respectively. See Section 3 for the definition of the Morrey and Campanato spaces and their fundamental properties.

In our proofs, we will use two interpolation operators onto S^h: the standard interpolation operator Π₁, defined as the linear interpolation of the nodal values of a (continuous) function, and the operator Π_{SZ} constructed in [SZ], which is based on local averages. If W^{2,p}(Ω) ↪ C^{0}(Ω), then

\begin{equation}
\|w - Π₁w\|_{L^{p};T} \leq ch^{2-\ell}\|D^2w\|_{p;T}
\end{equation}

for all w ∈ W^{2,p}(Ω_h), while

\begin{equation}
\|w - Π_{SZ}w\|_{L^{p};T} \leq ch^{2-\ell}\|D^2w\|_{2;S(T)},
\end{equation}

where S(T) = ∪(T' : T' ∩ T = ∅) for all w ∈ W^{2,2}(Ω_h).

In this paper we study general elliptic systems of second order of the form

\begin{equation}
-D_i(A_{ij}^α D_j u^α_i) = -D_i F^α_i + f_i, \quad i = 1, \ldots, m,
\end{equation}

where the coefficients A_{ij}^α satisfy the Legendre-Hadamard condition

\begin{equation}
A_{ij}^α \xi_α \eta_β \xi_β η_β \geq c|ξ|^2 |η|^2 \quad \forall ξ ∈ R^n, η ∈ R^m.
\end{equation}

Here we use the summation convention. However, our analysis does not include general systems which are elliptic in the sense of Agmon, Douglis and Nirenberg or saddle point problems. The corresponding weak formulation is given by

\begin{equation}
\langle a(u, ψ), ψ \rangle = \mathcal{F}(ψ) \quad \forall ψ ∈ W^{1,2}_0(Ω)
\end{equation}
with
\[ F(\psi) = \int_{\Omega} (F_i^\alpha D_\alpha \psi^i + f_i \psi^i) dx. \]

We say that \( u_h \in S^0_h \) is a finite element solution of the system if
\[ a(u_h, \psi_h) = F(\psi_h) \quad \forall \psi \in S^0_h(\Omega_h). \]

Here the bilinear form \( a(\cdot, \cdot) \) on \( W^{1,2} \times W^{1,2} \) associated with \( A \) is given by
\[ a(u, v) = \int_{\Omega_h} A^\alpha_i j D_\beta u^j D_\alpha v^i dx, \]
and we will use \( a_h \) to denote the bilinear form \( a \) restricted to \( \Omega_h \):
\[ a_h(u, v) = \int_{\Omega_h} A^\alpha_i j D_\beta u^j D_\alpha v^i dx. \]

The following result is a standard result in elliptic theory and can be found for example in [Gi], Teorema 10.1.

**Theorem 2.1** (Gårding’s inequality). Assume that the coefficients \( A^\alpha_i j \) are uniformly continuous in \( \bar{\Omega} \) and satisfy (2.4).

i) If the coefficients are constant, then there exists a constant \( \mu > 0 \) such that
\[ \int_{\Omega} A^\alpha_i j D_\beta \varphi^j D_\alpha \varphi^i dx \geq \mu \int_{\Omega} |D\varphi|^2 dx \quad \forall \varphi \in W^{1,2}_0(\Omega). \]

ii) There exists an \( R_0 > 0 \) such that (2.7) holds for all \( \varphi \) with \( \text{diam}(\text{spt} \varphi) < R_0 \).

iii) There exist constants \( \nu, H > 0 \) such that
\[ \int_{\Omega} A^\alpha_i j D_\beta \varphi^j D_\alpha \varphi^i dx \geq \nu \int_{\Omega} |D\varphi|^2 dx - H \int_{\Omega} |\varphi|^2 dx \quad \forall \varphi \in W^{1,2}_0(\Omega). \]

Throughout the paper all constants in the estimates depend only an \( n, m, \Omega, A \) and the constant in Gårding’s inequality (here we adopt the point of view that the constants in the other usual inequalities like Poincaré’s inequality or the Sobolev embedding theorem depend only on these quantities). In particular, they are independent of \( h, u, F, f \) and the center \( x_0 \) of the balls \( \Omega(x_0, R) \).

## 3. Elliptic regularity in Campanato spaces

Assume that \( \Omega \subset \mathbb{R}^n \) is an open domain, \( 1 \leq p < \infty \) and \( \lambda \geq 0 \). We define the Morrey space \( L^{p,\lambda}(\Omega) \) as the space of all functions \( u : \Omega \to \mathbb{R}^m \) such that \( u \in L^p(\Omega) \) and
\[ \|u\|_{L^{p,\lambda}(\Omega)}^p = \sup_{x_0 \in \Omega} \sup_{0 < \varrho < \text{diam}(\Omega)} \frac{1}{\varrho^\lambda} \frac{1}{\Omega(x_0, \varrho)} \int_{\Omega(x_0, \varrho)} |u|^p dx < \infty. \]

The Campanato space \( L^{p,\lambda}(\Omega) \) is the space of all functions \( u \in L^p(\Omega) \) for which
\[ [u]_{p,\lambda}^p = \sup_{x_0 \in \Omega} \sup_{0 < \varrho < \text{diam}(\Omega)} \frac{1}{\varrho^\lambda} \frac{1}{\Omega(x_0, \varrho)} \int_{\Omega(x_0, \varrho)} |u - (u)_{x_0, R}|^p dx < \infty. \]

Here \((u)_{x_0, R} = (u)_{\Omega(x_0, R)}\) denotes the mean value of \( u \) on \( \Omega(x_0, R) \):
\[ (u)_{x_0, R} = \frac{1}{|\Omega(x_0, R)|} \int_{\Omega(x_0, R)} u dx. \]
We endow $\mathcal{L}^{p,\lambda}(\Omega)$ with the norm $\|u\|_{\mathcal{L}^{p,\lambda}(\Omega)} = \|u\|_{L^p(\Omega)} + [u]_{p,\lambda}$. Defined in such a way, the Morrey and Campanato spaces are Banach spaces, and $\mathcal{L}^{p,\lambda}(\Omega)$ is isomorphic to $\mathcal{L}^{p,\lambda}(\Omega)$ if $0 \leq \lambda < n$ and the domain $\Omega$ is sufficiently smooth (in general one needs that $\Omega$ is a domain of type $A$; see [Ca1] for the precise definition). Moreover, $\mathcal{L}^{p,\lambda}(\Omega)$ is isomorphic to $C^{0,\sigma}(\bar{\Omega})$ with $\sigma = \frac{\lambda-n}{p}$ for $\lambda \in (n, n + p]$, while $\mathcal{L}^{p,\lambda}(\Omega)$ is isomorphic to $\text{BMO}(\Omega)$, the space of functions with bounded mean oscillation which was defined in the fundamental paper by John and Nirenberg [JN]. For more information about these spaces, see e.g. [KJF].

Starting from Campanato's paper [Ca1], a complete regularity theory for elliptic equations and systems has been developed (see, e.g. [Ca2], [Gi], [G]). We summarize the relevant results in the following two theorems (see [Gi], Capitolo 10). Part iii) in Theorem 3.1 follows by contradiction from the estimates in parts i) and ii), since in this situation the homogeneous equation has only the trivial solution. Throughout the paper we write $\lambda - 2$ instead of $(\lambda - 2)^+ = \max\{\lambda - 2, 0\}$.

**Theorem 3.1.** Assume that the coefficients $A^{\alpha\beta}_{ij}$ satisfy the Legendre-Hadamard condition (2.4). Let $u \in W^{1,2}_0(\Omega)$ be a weak solution of (2.5).

i) Suppose $\Omega$ is a domain of class $C^1$ and that $A^{\alpha\beta}_{ij} \in C^0(\bar{\Omega})$. If $\lambda \in [0, n)$, $F \in \mathcal{L}^{2,\lambda}(\Omega)$ and $f \in \mathcal{L}^{2,\lambda-2}(\Omega)$, then $Du \in \mathcal{L}^{2,\lambda}(\Omega)$ and we have the a priori estimate

$$\|Du\|_{\mathcal{L}^{2,\lambda}(\Omega)} \leq c\left(\|u\|_{L^2(\Omega)} + \|f\|_{\mathcal{L}^{2,\lambda-2}(\Omega)} + \|F\|_{\mathcal{L}^{2,\lambda}(\Omega)}\right).$$

ii) Suppose that $\Omega$ is a domain of class $C^{1,\sigma}$ and $A^{\alpha\beta}_{ij} \in C^{0,\sigma}(\bar{\Omega})$. If $F \in \mathcal{L}^{2,\lambda}(\Omega)$ and $f \in \mathcal{L}^{2,\lambda-2}(\Omega)$ with $\lambda \leq n + 2\sigma$, then $Du \in \mathcal{L}^{2,\lambda}(\Omega)$ and we have

$$\|Du\|_{\mathcal{L}^{2,\lambda}(\Omega)} \leq c\left(\|u\|_{L^2(\Omega)} + \|f\|_{\mathcal{L}^{2,\lambda-2}(\Omega)} + \|F\|_{\mathcal{L}^{2,\lambda}(\Omega)}\right).$$

iii) If the system has a unique solution, then the a priori estimates in i) and ii) hold without the norm of $u$ on the right hand side.

A similar result holds for the higher derivatives of $u$.

**Theorem 3.2.** Assume $\Omega$ is a domain of class $C^{k+1}$ ($C^{k+1,\sigma}$) and that the coefficients $A^{\alpha\beta}_{ij} \in C^{k}(\bar{\Omega})$ ($C^{k,\sigma}(\bar{\Omega})$) satisfy the Legendre-Hadamard condition (2.4). Let $u \in W^{1,2}_0(\Omega)$ be a weak solution of (2.5) and $k \geq 1$. Suppose that $D^kF \in \mathcal{L}^{2,\lambda}(\Omega)$ (resp. $\mathcal{L}^{2,\lambda}(\Omega)$) and $D^{k-1}f \in \mathcal{L}^{2,\lambda}(\Omega)$ with $\lambda \in (0, n)$ (resp. $\mathcal{L}^{2,\lambda}(\Omega)$ with $\lambda \leq n + 2\sigma$). Then $D^{k+1}u \in \mathcal{L}^{2,\lambda}(\Omega)$ (resp. $\mathcal{L}^{2,\lambda}(\Omega)$), and we have the corresponding a priori estimates.

The main ingredient in the proof of these regularity results is local decay estimates for the solution of the homogeneous system, which we will refer to as Campanato inequalities.

**Proposition 3.3.** Assume that the coefficients $A^{\alpha\beta}_{ij}(x_0)$ satisfy (2.4) and that $v$ is a solution of the homogeneous system $D_\alpha(A^{\alpha\beta}_{ij}(x_0)D_\beta v) = 0$ in $\Omega(x_0, R)$.

i) If $\Omega(x_0, R) \subset \Omega$, then for all $0 < q < R$

$$\int_{\Omega(x_0, q)} |Dv|^2 dx \leq c\left(\frac{q}{R}\right)^n \int_{\Omega(x_0, R)} |Dv|^2 dx,$$
and
\[
\int_{\Omega(x_0, \varrho)} |Dv - (Dv)_{x_0, R}|^2 \, dx \leq c \left( \frac{\varrho}{R} \right)^{n+2} \int_{\Omega(x_0, R)} |Dv - (Dv)_{x_0, R}|^2 \, dx.
\]

ii) If \( x_0 \in \partial \Omega \) and \( \Omega(x_0, R) = B(x_0, R)^+ \) with \( v = 0 \) on \( \Gamma_R \), then
\[
\int_{\Omega(x_0, \varrho)} |Dv|^2 \, dx \leq c \left( \frac{\varrho}{R} \right)^n \int_{\Omega(x_0, R)} |Dv|^2 \, dx,
\]
and
\[
\int_{\Omega(x_0, \varrho)} |Dv - (D_n v)_{x_0, \varrho} \otimes e_n|^2 \, dx \leq c \left( \frac{\varrho}{R} \right)^{n+2} \int_{\Omega(x_0, R)} |Dv - (D_n v)_{x_0, R} \otimes e_n|^2 \, dx.
\]

Remark. For systems with continuous coefficients one obtains a similar estimate with an additional term \( \omega^2(R) \int_{\Omega(x_0, R)} |Dv|^2 \, dx \) on the right hand side, where \( \omega \) denotes the oscillation of the coefficients on \( \Omega(x_0, R) \).

We define the following discrete analogues of the Morrey spaces \( L^{2,\lambda}(\Omega) \) and the Campanato spaces \( L^{2,\lambda}(\Omega) \), where the radii in the definition are bounded from below by \( h \). A function \( u \) belongs to the discrete Morrey space \( L^{p,\lambda}_h(\Omega) \) if
\[
\|u\|^{p,\lambda}_{L_h^p} = \sup_{x_0 \in \Omega} \sup_{0 \leq \varrho < \text{diam}(\Omega)} \frac{1}{\varrho^\lambda} \int_{\Omega(x_0, \varrho)} |u|^p \, dx < \infty,
\]
and to the discrete Campanato space \( L^{p,\lambda}_h(\Omega) \) if
\[
[u]^{p,\lambda,h}_{L_h^p} = \sup_{x_0 \in \Omega} \sup_{0 \leq \varrho < \text{diam}(\Omega)} \frac{1}{\varrho^\lambda} \int_{\Omega(x_0, \varrho)} |u - (u)_{x_0, \varrho}|^p \, dx < \infty.
\]

The following lemma shows that a function \( u_h \in S^h \) is bounded in \( L^{2,\lambda}(\Omega_h) \) if and only if it is bounded in \( L^{2,\lambda}_h(\Omega_h) \).

**Lemma 3.4.** Let \( u_h \in S^h \), \( h > 0 \) small enough, and \( 0 \leq \lambda \leq n \).

i) If \( u_h \in L^{2,\lambda}(\Omega_h) \) with \( \|u\|_{L^{2,\lambda}_h} \leq C \), then \( u_h \in L^{2,\lambda}(\Omega_h) \) and \( \|u_h\|_{L^{2,\lambda}_h} \leq \tilde{C} \), where \( \tilde{C} \) depends only \( \sigma_0, \lambda, n \) and \( C \).

ii) The same statement holds also for \( L^{2,\lambda}_h(\Omega_h) \).

**Proof.** Assume that \( 0 < \varrho \leq h \) and let \( T_i, i = 1, \ldots, L, \) be the triangles \( T \in T_h \) such that \( T \cap \Omega_h(x_0, \varrho) \neq \emptyset \). To prove i), choose points \( x_i \in T_i \) such that \( \Omega_h(x_i, \sigma_0 h) \subset T_i \). Then
\[
\frac{1}{\varrho^\lambda} \int_{\Omega_h(x_0, \varrho)} |Du_h|^2 \, dx \leq \sum_{i=1}^L \frac{|T_i \cap \Omega_h(x_0, \varrho)|^{\lambda/n} |T_i \cap \Omega_h(x_i, \varrho)|^{1-\lambda/n}}{\varrho^\lambda} \frac{1}{(\sigma_0 h)^{n-\lambda}} \int_{\Omega_h(x_i, \sigma_0 h)} |Du_h|^2 \, dx \leq cLC,
\]
where \( c \) depends only on \( \sigma_0, \lambda \) and \( n \). To prove ii), choose for a given domain \( \Omega_h(x_0, \varrho) \) the smallest radius \( \tilde{\varrho} \) such that \( \Omega_h(x_0, \tilde{\varrho}) \) contains all triangles \( T_i \in T_h \).
defined above. If \( x_0 \in \Omega_h \) and \( \Omega_h(x_0, \hat{\varrho}) \cap \partial \Omega_h \neq \emptyset \), then replace \( \Omega_h(x_0, \hat{\varrho}) \) by a domain \( \Omega_h(\bar{x}_0, \hat{\varrho}) \) such that \( \hat{\varrho} \leq c \varrho \) and \( \Omega_h(x_0, \hat{\varrho}) \subset \Omega_h(\bar{x}_0, \hat{\varrho}) \). Otherwise define \( \bar{x}_0 = x_0 \) and \( \hat{\varrho} = \hat{\varrho} \). Then we conclude, as in case \( i \), that

\[
\frac{1}{\varrho^\lambda} \int_{\Omega_h(x_0, \varrho)} |Du_h - (Du_h)_{x_0, \varrho}|^2 dx \leq \frac{c}{\varrho^\lambda} \int_{\Omega_h(x_0, \varrho)} |Du_h - \xi|^2 dx
\]

\[
\leq \frac{c}{\varrho^\lambda} \int_{\Omega_h(\bar{x}_0, \hat{\varrho})} |Du_h - \xi|^2 dx,
\]

and the assertion follows with \( \xi = (Du_h)_{\bar{x}_0, \hat{\varrho}} \). \( \square \)

4. A POINTWISE INTERIOR ESTIMATE

The main result in this section is the pointwise estimate in Proposition 4.8. It is based on the following analogues of the Campanato inequalities in Section 3 for the finite element solution \( u_h \) on balls \( \Omega(x_0, R) \subset \Omega \). Throughout the rest of the paper we will set

\[
\mathcal{R}_h(F, f; R) = \int_{\Omega_h(x_0, R)} |F - (F)_{\Omega_h(x_0, R)}|^2 dx + R^2 \int_{\Omega_h(x_0, R)} |f|^2 dx,
\]

and \( \eta \) denotes a nonnegative, continuous function such that \( \eta(t) \leq ct^{1/n} \) for \( n \geq 3 \) and \( \eta(t) \leq c(\mu)t^\mu \) for all \( \mu \in (0, 1/2) \) for \( n = 2 \). We denote the modulus of continuity of the coefficients by \( \omega \), i.e.

\[
\omega(R) = \sup_{|x-x_0|<R} \sup_{\alpha, \beta=1, \ldots, n} \sup_{i,j=1, \ldots, m} |A^\alpha_{ij}(x) - A^\alpha_{ij}(x_0)|.
\]

**Lemma 4.1.** There exists a constant \( \Lambda > 0 \) such that for all \( h \leq \varrho \leq R \leq R_0 \) and \( R \geq \Lambda h \) the following inequalities hold:

\[
\int_{\Omega(x_0, \varrho)} |Du_h|^2 dx \leq c\left\{ \left( \frac{\varrho}{R} \right)^n + \omega^2(R) + \eta\left( \frac{h}{R} \right) \right\} \int_{\Omega(x_0, R)} |Du_h|^2 dx + c\mathcal{R}_h(F, f; R),
\]

\[
\int_{\Omega(x_0, \varrho)} |Du_h - (Du_h)_{x_0, \varrho}|^2 dx \leq c\left\{ \left( \frac{\varrho}{R} \right)^{n+2} + \eta\left( \frac{h}{R} \right) \right\} \int_{\Omega(x_0, R)} |Du_h - (Du_h)_{x_0, R}|^2 dx
\]

\[+ c\omega^2(R) \int_{\Omega(x_0, R)} |Du_h|^2 dx + c\mathcal{R}_h(F, f; R).\]

Here \( \Lambda \) is independent of \( x_0, h, \varrho, R, u \) and \( u_h \).

We split the proof into a series of lemmas. The idea is to decompose \( u_h \) as a sum \((u_h - w) + w\), where \( w \in W^{1,2}(\Omega(x_0, R)) \) is the solution of the homogeneous system with constant coefficients

\[
a_0(w, \psi) = 0 \quad \forall \psi \in W^{1,2}_0(\Omega(x_0, R)), \quad w = u_h \quad \text{on } \partial \Omega(x_0, R),
\]
and to use the Campanato estimate in Proposition 3.3 for \( w \). Here \( a_0 \) denotes the bilinear form with constant coefficients \( A^0_{ij}(x_0) \). It follows from \( w = u_h \) on \( \partial \Omega(x_0, R) \) and the divergence theorem that

\[
\int_{\Omega(x_0, R)} D_{ij}w^i dx = \int_{\Omega(x_0, R)} D_{ij}u^i_h dx, \quad i = 1, \ldots, m, \alpha = 1, \ldots, n.
\]

We summarize the important properties of \( w \) in the following lemma.

**Lemma 4.2.** Assume that \( w \) is the solution of (4.2).

i) We have the a priori estimate

\[
\int_{\Omega(x_0, R)} |Dw - \xi|^2 dx \leq c \int_{\Omega(x_0, R)} |Du_h - \xi|^2 dx \quad \forall \xi \in \mathbb{R}^{mn}.
\]

ii) We have for \( k \geq 2 \) the Caccioppoli estimate

\[
\int_{\Omega(x_0, R)} |D^k w|^2 dx \leq \frac{c}{(R - \rho)^{2(k-1)}} \int_{\Omega(x_0, R)} |Dw - \xi|^2 dx \quad \forall \xi \in \mathbb{R}^{mn}.
\]

iii) We have the pointwise estimate

\[
\sup_{x \in \Omega(x_0, \rho)} |D^k w|^2 \leq \frac{c}{(R - \rho)^{2(k-1)}} \frac{1}{R^n} \int_{\Omega(x_0, R)} |Dw - \xi|^2 dx \quad \forall \xi \in \mathbb{R}^{mn}.
\]

**Proof.** In view of Gårding’s inequality we obtain i) from \( a_0(u_h - w, u_h - w) = a_0(u_h, u_h - w) \). The Caccioppoli estimate in ii) is standard (see, e.g. [Gi]), and the pointwise estimate follows from ii) by Sobolev’s embedding theorem. \( \square \)

In order to obtain an estimate for \( Du_h - Dw \) we define

\[
(4.4) \quad \psi = \xi^2(u_h - w), \quad \psi_h = \Pi_1 \psi,
\]

where \( \xi \geq 0 \) is a smooth cut–off function such that \( \xi = \Pi_1 \xi = 0 \) on \( \mathbb{R}^n \setminus \Omega(x_0, \frac{3}{4}R) \), \( \xi = 1 \) on \( \Omega(x_0, \frac{5}{8}R) \), and \( \|D^i \xi\|_{L^\infty} \leq cR^{-i} \) for \( i = 1, 2 \) (\( R \) will be of order one, and the existence of \( \xi \) is thus clear for \( h \) small enough). The following estimate of the difference \( \psi - \psi_h \) in the energy norm will be important. For \( n \leq 3 \) an estimate of this type follows easily from the interpolation estimate (2.1). In arbitrary dimensions, however, a direct computation is necessary.

**Lemma 4.3.** Let \( \psi \) and \( \psi_h \) be defined as in (4.4).

i) We have the local estimate

\[
\int_T |D\psi - D\psi_h|^2 dx \leq \sup_{x \in T} c^2(x) \left\{ \frac{c}{R^2} \int_T |u_h - w|^2 dx + c h^2 |T| \sup_{x \in T} |D^2 w(x)|^2 \right\}.
\]

ii) We have for all \( \xi \in \mathbb{R}^{mn} \) the global estimate

\[
\int_{\Omega(x_0, R)} |D\psi - D\psi_h|^2 dx \leq \frac{c}{R^2} \int_{\Omega(x_0, R)} |u_h - w|^2 dx + c \frac{h^2}{R^2} \int_{\Omega(x_0, R)} |Dw - \xi|^2 dx.
\]
Proof. Clearly ii) follows from i) by Lemma 4.2. To prove i), let \( a_i, i = 1, \ldots, n + 1 \), be the nodes of the simplex \( T \) and \( \Phi_i \) the standard nodal basis of \( T \), i.e., \( \Phi_i(a_j) = \delta_{ij} \). Then \( \Pi_1 w(x) = \sum_{i=1}^{n+1} \Phi_i(x) w(a_i) \) for all \( w \in C^0(T) \). We have

\[
D \psi = 2 \zeta D \zeta(u_h - w) + \zeta^2 (Du_h - Dw),
\]
and the assertion of the lemma follows easily from Young’s inequality.

We have

\[
\int_T |D \psi - D \psi_h|^2 \leq \frac{c}{R^2} \sup_{x \in T} \zeta^2(x) \int_T |u_h - w|^2 dx + c \int_T \zeta^2 |D w - Du_h|^2 dx \]

\[
+ c \int_T |\zeta^2 (Du_h - Dw) - D \psi_h|^2 dx.
\]

The second term is estimated by the interpolation inequality (2.1) with \( p = \infty \), while by definition of \( \psi_h \)

\[
\int_T |\zeta^2 (Du_h - Dw) - D \psi_h|^2 dx
\]

\[
= \int_T \left| \sum_{i=1}^{n+1} D \Phi_i(x) (u_h - w)(a_i) (\zeta^2(x) - \zeta^2(a_i)) \right|^2 dx
\]

\[
\leq \sum_{i=1}^{n+1} \sup_{x \in T} |D \Phi_i(x)|^2 |(u_h - w)(a_i)|^2 \frac{|\zeta^2(x) - \zeta^2(a_i)|^2}{|T|}.
\]

By assumption \( \sup_{x \in \Omega_0} |D \Phi_i(x)| \leq c h^{-1} \) and \( \sup_{x \in T} |\zeta(x) - \zeta(a_i)| \leq c |x - a_i|/R \); therefore

\[
\sup_{x \in T} |\zeta^2(x) - \zeta^2(a_i)| \leq c \frac{|x - a_i|}{R} \sup_{x \in T} |\zeta(x) + \zeta(a_i)| \leq 2c \frac{\text{diam}(T)}{R} \sup_{x \in T} |\zeta|.
\]

Since \( \int_T |v_h|^2 dx \) and \( |T| \sum_{i=1}^{n+1} |v_h(a_i)|^2 \) are equivalent norms on \( T \), we obtain

\[
\int_T |\zeta^2 (Du_h - Dw) - D \psi_h|^2 dx \leq \frac{c}{R^2} \sup_{x \in T} \zeta^2 \int_T |u_h - \Pi_1 w|^2 dx,
\]
and the assertion of the lemma follows easily. \( \square \)

By (2.6) and (4.2) we obtain, since \( \psi_h \in S_0^h \),

\[
a(u_h - w, \psi) = a(u_h - w, \psi - \psi_h) + F(\psi_h) - (a - a_0)(w, \psi_h).
\]

We estimate the different terms in the following lemmas.

Lemma 4.4. We have

\[
a(u_h - w, \psi) \geq c \int_{\Omega(x_0, R)} \zeta^2 |Du_h - Dw|^2 dx - \frac{c}{R^2} \int_{\Omega(x_0, R)} |u_h - w|^2 dx,
\]
where the constant \( c > 0 \) depends on the constant in Gårding’s inequality.

Proof. A direct computation shows that

\[
A_{ij}^{\alpha \beta} D_\beta(u^i_h - w^i) D_\alpha(\zeta^2(u^i_h - w^i)) = A_{ij}^{\alpha \beta} D_\beta(\zeta(u^i_h - w^i)) D_\alpha(\zeta(u^i_h - w^i))
\]

\[
+ A_{ij}^{\alpha \beta} D_\beta u^i_h D_\alpha \zeta(\zeta(u^i_h - w^i)) - A_{ij}^{\alpha \beta} D_\beta(\zeta(u^i_h - w^i)) D_\alpha(\zeta u^i_h - w^i)).
\]

By Gårding’s inequality

\[
a(u_h - w, \psi) \geq c \int_\Omega |D(\zeta(u_h - w))|^2 dx - (mn) |A|_{\infty} |D \zeta|_{\infty} \|u_h - w\|_{2, \Omega(x_0, R)}
\]

\[
\cdot \left\{ \|D(u_h - Dw)\|_{2, \Omega(x_0, R)} + \|D(\zeta(u_h - w))\|_{2, \Omega(x_0, R)} \right\},
\]
and the assertion of the lemma follows easily from Young’s inequality. \( \square \)
Lemma 4.5. We have for $\varepsilon > 0$

$$|a(u_h - w, \psi - \psi_h)| \leq \varepsilon \int_{\Omega(x_0, R)} \zeta^2 |Du_h - Dw|^2 \, dx$$

$$+ c \left\{ \frac{h}{R} \int_{\Omega(x_0, R)} |Du_h - \xi|^2 \, dx + \frac{1}{\varepsilon R^2} \int_{\Omega(x_0, R)} |u_h - w|^2 \, dx \right\}.$$ 

Proof. Choose for each triangle $T \in \mathcal{T}_h$ a point $x_T$ such that $\sup_{x \in T} \zeta(x) = \zeta(x_T)$. We have, by Hölder's inequality and Lemma 4.3,

$$|a(u_h - w, \psi - \psi_h)|$$

$$\leq (mn)|A|_{\infty} \sum_{T \cap \text{spt} \xi \neq \emptyset} \|Du_h - Dw\|_{2;T} \|D\psi - D\psi_h\|_{2;T}$$

$$\leq c \sum_{T \cap \text{spt} \xi \neq \emptyset} \|Du_h - Dw\|_{2;T} \left\{ \frac{\zeta(x_T)}{R} \|u_h - w\|_{2;T} + h|T|^{1/2} \sup_{x \in T} |D^2 w(x)| \right\}.$$ 

By definition

$$\zeta(x_T) \|Du_h - Dw\|_{2;T} \leq \|\zeta(x_T) - \zeta(Du_h - Dw)\|_{2;T} + \|\zeta(Du_h - Dw)\|_{2;T}$$

$$\leq \sup_{x \in T} \frac{\zeta(x) - \zeta(x_T)}{|x - x_T|} |x - x_T| \|Du_h - Dw\|_{2;T} + \|\zeta(Du_h - Dw)\|_{2;T}$$

$$\leq c \frac{\text{diam}(T)}{R} \|Du_h - Dw\|_{2;T} + \|\zeta(Du_h - Dw)\|_{2;T},$$

and therefore we obtain

$$\sum_{T \cap \text{spt} \xi \neq \emptyset} \|Du_h - Dw\|_{2;T} \frac{\zeta(x_T)}{R} \|u_h - w\|_{2;T}$$

$$\leq c \sum_{T \cap \text{spt} \xi \neq \emptyset} \frac{h}{R^2} \|Du_h - Dw\|_{2;T} \|u_h - w\|_{2;T} + \frac{1}{R} \|\zeta(Du_h - Dw)\|_{2;T} \|u_h - w\|_{2;T}$$

$$\leq \varepsilon \int_{\Omega(x_0, R)} \zeta^2 |Du_h - Dw|^2 \, dx + \frac{h^2}{R^2} \int_{\Omega(x_0, R)} |Du_h - Dw|^2 \, dx + \frac{c}{\varepsilon R^2} \int_{\Omega(x_0, R)} |u_h - w|^2 \, dx.$$ 

On the other hand, we obtain by Lemma 4.2

$$\sum_{T \cap \text{spt} \xi \neq \emptyset} \|Du_h - Dw\|_{2;T} h|T|^{1/2} \sup_{x \in T} |D^2 w|$$

$$\leq c \frac{h}{R} \int_{\Omega(x_0, R)} |Du_h - Dw|^2 \, dx + chR|\Omega(x_0, R)| \sup_{x \in \Omega(x_0, R)} |D^2 w|^2$$

$$\leq c \frac{h}{R} \int_{\Omega(x_0, R)} |Du_h - Dw|^2 \, dx + \frac{h}{R} \int_{\Omega(x_0, R)} |Dw - \xi|^2 \, dx,$$

and the assertion of the lemma follows easily in view of Lemma 4.2. \qed
Lemma 4.6. We have
\[
|\mathcal{F}(\psi_h) - (a - a_0)(w, \psi_h)| \\
\leq \frac{c}{\varepsilon} \left\{ \omega^2(R) \int_{\Omega(x_0, R)} |Dw|^2 \, dx + \mathcal{R}_h(F, f; R) \right\} \\
+ \varepsilon \left\{ \int_{\Omega(x_0, R)} \zeta^2 |Du_h - Dw|^2 \, dx \\
+ \frac{1}{R^2} \int_{\Omega(x_0, R)} |u_h - w|^2 \, dx + \int_{\Omega(x_0, R)} |Du_h - \xi|^2 \, dx \right\}.
\]

Proof. Since \( \psi_h \in W^{1,2}_0(\Omega_h(x_0, R)) \), we have by definition
\[
|\mathcal{F}(\psi_h) - (a - a_0)(w, \psi_h)| \leq \|D\psi_h\|_{2;\Omega(x_0, R)} \\
\cdot \left( \|F - (F)\Omega_h(x_0, R)\|_{2;\Omega_h(x_0, R)} + cR\|f\|_{2;\Omega_h(x_0, R)} + mn\omega(R)\|Dw\|_{2;\Omega(x_0, R)} \right).
\]

By the triangle inequality
\[
\|D\psi_h\|^2_{2,\Omega} \leq 2\|D\psi - D\psi_h\|^2_{2,\Omega} + 2\|D\psi\|^2_{2,\Omega},
\]
and the assertion of the lemma follows easily in view of Lemmas 4.3 and 4.2. \( \square \)

If we combine the inequalities in the above lemmas with the estimates in Lemma 4.2, we obtain the following inequality:
\[
\int_{\Omega(x_0, R)} \zeta^2 |Du_h - Dw|^2 \, dx \\
\leq c \left\{ \frac{h}{R} \int_{\Omega(x_0, R)} |Du_h - (Du_h)_{x_0, R}|^2 \, dx + \mathcal{R}_h(F, f; R) \\
+ \frac{1}{R^2} \int_{\Omega(x_0, R)} |u_h - w|^2 \, dx + \omega^2(R) \int_{\Omega(x_0, R)} |Du_h|^2 \, dx \right\}.
\]

It therefore remains to estimate \( \|u_h - w\| \). This is done in the following lemma with a duality argument.

Lemma 4.7. There exists a constant \( \Lambda > 0 \) such that for all \( R \) with \( R \geq \Lambda h \) the following inequality holds:
\[
\int_{\Omega(x_0, R)} |u_h - w|^2 \, dx \leq \eta \left( \frac{h}{R} \right)^2 R^2 \int_{\Omega(x_0, R)} |Du_h - Dw|^2 \, dx \]
\[
+ cR^2 \left\{ \omega^2(R) \int_{\Omega(x_0, R)} |Dw|^2 \, dx + \mathcal{R}_h(F, f; R) \right\}.
\]

Remark. Let \( v \in W^{1,2}_0(\Omega(x_0, R)) \) be the solution of
\[
-D_\alpha(A_\alpha^{ij} D_\beta v^j) = -D_\alpha F^\alpha_i + f_i
\]
Let \( r \) be the scaling coefficient. By definition of \( R \) on \( s \), solves approximately the system
\[
(4.6) \quad \|v\|_{2;\Omega(x_0,R)} + R \|Dv\|_{2;\Omega(x_0,R)} + R^2 \|D^2v\|_{2;\Omega(x_0,R)} \leq c(R^2\|f\|_{2;\Omega(x_0,R)} + R\|F - (F)_{x_0,R}\|_{2;\Omega(x_0,R)}).
\]
This scaling is expressed in the inequality above, since \( u_h - w \in W^{1,2}(\Omega(x_0,R)) \) solves approximately the system
\[
-D_\alpha(A_{ij}^\beta D_\beta (u_h^i - w^j)) = -D_\alpha(F_i^\alpha + (A_{ij}^\beta - A_{ij}^{\alpha\beta}(x_0))D_\beta w^j) + f_i.
\]

**Proof.** We give the proof for \( n \geq 3 \) (for \( n = 2 \) use Hölder’s inequality to deduce an analogue of (4.7) below). We will show that for \( \delta, \varepsilon > 0 \)
\[
\int_{\Omega(x_0,R)} |u_h - w|^2 \, dx \leq \varepsilon R^2 \int_{\Omega(x_0,R)} |Du_h - Dw|^2 \, dx + \left( \frac{\varepsilon}{\delta}\left(\frac{h}{R}\right)^2 + \delta \right) \int_{\Omega(x_0,R)} |u_h - w|^2 \, dx
\]
\[
+ \frac{c}{\delta} R^2 \omega^2(R) \int_{\Omega(x_0,R)} |Dw|^2 \, dx + R_h(F, f; R);
\]
the assertion of the lemma follows with \( \varepsilon = (\frac{h}{R})^{1/n} \) and \( \delta, \frac{h}{R} \) small enough.

Let \( z \in W^{1,2}_0(\Omega(x_0,R)) \) be the solution of the adjoint system
\[
-D_\alpha(A_{ij}^{\alpha\beta} D_\beta z^j) = u_h^i - w^i.
\]
Then \( z \in W^{2,2}(\Omega(x_0,R)) \), and the estimate (4.6) holds with \( f = u_h - w \) and \( F = 0 \). Let \( r \in (0, \frac{R}{2}) \), and choose a cut-off function \( \tau \) such that \( \tau = 1 \) on \( \Omega(x_0,R-r) \), \( \tau = 0 \) on \( \mathbb{R}^n \setminus \Omega(x_0,R) \) and \( |D^i \tau|_\infty \leq c h^{-i} \) for \( i = 1, 2 \). Let \( A_r = \Omega(x_0,R \setminus \Omega(x_0,R-r) \). We fix \( r = ch \) such that \( \tau = 1 \setminus \Omega(x_0,R) \). By Hölder’s inequality, the Sobolev embedding theorem, and (4.6)
\[
(4.7) \quad \|Dz\|_{2;A_r} \leq |A_r|^{1/n} \|Dz\|_{2n/(n-2);\Omega(x_0,R)}
\]
\[
\leq c|A_r|^{1/n} \left( \left(\frac{1}{R}\right)^{1/n} \|Dz\|_{2;\Omega(x_0,R)} + \|D^2z\|_{2;\Omega(x_0,R)} \right)
\]
\[
\leq cR \left(\frac{h}{R}\right)^{1/n} \|u_h - w\|_{2;\Omega(x_0,R)}.
\]

By definition of \( z \)
\[
\int_{\Omega(x_0,R)} |u_h - w|^2 \, dx = \int_{\Omega(x_0,R)} A_{ji}^{\beta \alpha} D_\beta D_\alpha (u_h^i - w^i)(1 - \tau) \, dx
\]
\[
+ \int_{\Omega(x_0,R)} A_{ji}^{\beta \alpha} D_\beta D_\alpha (u_h^i - w^i) \tau \, dx.
\]
The first term is easily estimated, since by (4.7)
\[
(mn)|A|_\infty \|Dz\|_{2;A_r} \|Du_h - Dw\|_{2;A_r}
\]
\[
\leq (mn)|A|_\infty cR \left(\frac{h}{R}\right)^{1/n} \|u_h - w\|_{2;\Omega(x_0,R)} \|Du_h - Dw\|_{2;\Omega(x_0,R)}.
\]
We rewrite the second term in view of (2.6) and (4.2) as
\[
(4.8) \quad a(u_h - w, \tau z - \Pi_{SZ}(\tau z)) - (a - a_0)(w, \Pi_{SZ}(\tau z)) + \mathcal{F}(\Pi_{SZ}(\tau z)) \\
- \int_{\Omega(x_0, R)} A^{\alpha}_{ji} D_\beta \tau z^j D_\alpha (u_h - w) \, dx.
\]
We use the interpolation inequality to estimate the first term in (4.8):
\[
a(u_h - w, \tau z - \Pi_{SZ}(\tau z)) \leq c \sum_{T \in \text{spt } \tau \neq \emptyset} h \|D^2(\tau z)\|_{L^2(T)} \|Du_h - Dw\|_{L^2(T)}
\]
By (4.6), (4.7) and Poincaré’s inequality on \(A_r\),
\[
\int_{\Omega(x_0, R)} |D^2(\tau z)|^2 \, dx \leq c \int_{\Omega(x_0, R)} |D^2 z|^2 \, dx + \frac{c}{h^2} \int_{A_r} |Dz|^2 \, dx \leq \left\{ c + c \frac{R^2}{h^2} \left( \frac{h}{R} \right)^{2/n} \right\} \int_{\Omega(x_0, R)} |u_h - w|^2.
\]
The last term in (4.8) is bounded by
\[
(mn)|A|\frac{\epsilon}{R} \|z\|_{L^2(A_r)} \|Du_h - Dw\|_{L^2(\Omega(x_0, R))} \\
\leq \epsilon R^2 \int_{\Omega(x_0, R)} |Du_h - Dw|^2 \, dx + \frac{c}{\epsilon^2 R^2 h^2} \int_{A_r} |z|^2 \, dx,
\]
and we proceed as before. The remaining terms in (4.8) are finally estimated with \(\delta > 0\) by
\[
\frac{R^2}{2\delta} \left( \omega^2(R) \int_{\Omega(x_0, R)} |Dw|^2 \, dx + cR_h(F, f; R) \right) + \frac{1}{2} \frac{\epsilon R^2}{h^2} \int_{\Omega(x_0, R)} |D\Pi_{SZ}(\tau z)|^2 \, dx.
\]
By the stability of \(\Pi_{SZ}\) (see [SZ]) we get
\[
\int_{\Omega(x_0, R)} |D\Pi_{SZ}(\tau z)|^2 \, dx \leq c \int_{\Omega(x_0, R)} |D(\tau z)|^2 + h^2 |D^2(\tau z)|^2 \, dx,
\]
and the estimates follow as above.

Proof of Lemma 4.1. Inequality (4.5) implies with Lemma 4.7 and Lemma 4.2 that
\[
\int_{\Omega(x_0, R)} \zeta^2 |Du_h - Dw|^2 \, dx \\
\leq \left\{ \eta \left( \frac{h}{R} \right) \int_{\Omega(x_0, R)} \zeta^2 |Du_h - (Du_h)_{x_0, R}|^2 \, dx + \omega^2(R) \int_{\Omega(x_0, R)} |Du_h|^2 \, dx + R_h(F, f; R) \right\}.
\]
On the other hand, from the Campanato inequality in Proposition 3.3 for $w$ and the triangle inequality we have
\[
\int_{\Omega(x_0, \rho)} |Du_h|^2 \, dx \leq 2 \int_{\Omega(x_0, \rho)} |Dw|^2 \, dx + 2 \int_{\Omega(x_0, R)} \zeta^2 |Du_h - Dw|^2 \, dx
\]
\[
\leq 2c \left( \frac{\rho}{R} \right)^n \int_{\Omega(x_0, R)} |Dw|^2 \, dx + 2 \int_{\Omega(x_0, R)} \zeta^2 |Du_h - Dw|^2 \, dx.
\]
This yields the first inequality for $u_h$. The second follows analogously with the mean value form of the Campanato inequality: by the minimality of the mean value,
\[
\int_{\Omega(x_0, \rho)} |Du_h - (Du_h)_{x_0, \rho}|^2 \, dx \leq c \int_{\Omega(x_0, \rho)} |Dw| \, dx + c \int_{\Omega(x_0, \rho)} |Du_h - Dw|^2 \, dx.
\]
We now conclude as above. It follows from (4.3) that $(Du)_{x_0, R} = (Du_h)_{x_0, R}$, and we can therefore use Proposition 3.3 and Lemma 4.2 with $\xi = (Du_h)_{x_0, R}$ to estimate the first term on the right hand side. This implies the assertion of the lemma. \( \square \)

**Proposition 4.8.** Assume that $\Omega_h$ is a regular triangulation, $u_h$ the solution (2.6) and $\delta_0 > 0$.

i) Let $\lambda \in [0, n)$. Assume that $A^{ij}_{kl} \in C^{0}(\Omega)$, $f \in L^{2,n-2}(\Omega_h)$ and $F \in L^{2,n}(\Omega_h)$. Then there exist constants $\alpha_0, h_0 > 0$, which depend only on $\Omega$, $n$, $\lambda$, and $\delta_0$, such that $R_\lambda < \delta_0$, and for all $x_0 \in \Omega$ with $\text{dist}(x_0, \partial \Omega) > \delta_0$ and $h \leq h_0$,
\[
\text{sup}_{h < \rho \leq R_\lambda} \frac{1}{\rho^n} \int_{\Omega(x_0, \rho)} |Du_h|^2 \, dx \leq \alpha_0 \left( \|u_h\|_{L^{2,n}(\Omega_h)}^2 + \|f\|_{L^{2,n-2}(\Omega_h)}^2 + \|F\|_{L^{2,n}(\Omega_h)}^2 \right).
\]

ii) If $A^{ij}_{kl} \in C^{0,\sigma}(\Omega)$ for some $\sigma > 0$, $f \in L^{2,n-2}(\Omega_h)$ and $F \in L^{2,n}(\Omega_h)$, then there exist constants $\alpha_0, h_0 > 0$, which depend only on $\Omega$, $n$, $\sigma$, $A$, and $\delta_0$, such that $R_\lambda < \delta_0$ and, for all $x_0 \in \Omega$ with $\text{dist}(x_0, \partial \Omega) > \delta_0$ and for $h \leq h_0$,
\[
\text{sup}_{h < \rho \leq R_\lambda} \frac{1}{\rho^n} \int_{\Omega(x_0, \rho)} |Du_h - (Du_h)_{x_0, \rho}|^2 \, dx \leq \alpha_0 \left( \|u_h\|_{L^{2,n}(\Omega_h)}^2 + \|f\|_{L^{2,n-2}(\Omega_h)}^2 + \|F\|_{L^{2,n}(\Omega_h)}^2 \right).
\]

**Remark.** The proof shows that we only need the quantity
\[
\text{sup}_{x_0 \in \Omega} \text{sup}_{h \leq h_0} \frac{1}{R} \int_{\Omega(x_0, R)} |F - (F)_{\Omega_h}(x_0, R)|^2 \, dx
\]
to be bounded, i.e., $F \in L^{2,n}(\Omega_h)$.

**Proof.** We first prove i). Let
\[
\Psi(t) = \frac{1}{t^\lambda} \int_{\Omega(x_0, t)} |Du_h|^2 \, dx.
\]
We obtain, by Lemma 4.1 for \( \varrho = \tau R \) with \( \tau \in (0, 1) \),
\[
\Psi(\tau R) \leq c \left\{ \tau^{n-\lambda} + \tau^{-\lambda} \left( \omega^2(R) + \eta \left( \frac{h}{R} \right) \right) \right\} \Psi(R) + c \tau^{-\lambda} \left\{ \|f\|_{L^{2,\lambda-2}(\Omega_h)}^2 + \|F\|_{L^{2,\lambda}(\Omega_h)}^2 \right\},
\]
whenever \( R_0 \geq R \geq \Delta h \) and \( \tau R \geq h \), since
\[
\frac{1}{R^\lambda} \int_{\Omega_h(x_0,R)} |F - (F)_{\Omega_h(x_0,R)}|^2 \, dx \leq c \|F\|_{L^{2,\lambda}(\Omega_h)}^2,
\]
and
\[
\frac{R^2}{\Omega_h(x_0,R)} \int |f|^2 \, dx \leq c \|f\|_{L^{2,\lambda}(\Omega_h)}^2.
\]
Now choose first \( \tau \) small enough so that \( c \tau^{n-\lambda} \leq \frac{1}{4} \), then \( \hat{R}_0 \) small enough so that \( c \tau^{-\lambda} \omega(\hat{R}_0) \leq \frac{1}{4} \), and finally \( \Lambda_1 \geq \max\{\Lambda, \tau^{-1}\} \) big enough so that \( \eta(\frac{1}{\Lambda_1}) \leq \frac{1}{4} \). Let \( R_0^0 = \min\{R_0, \hat{R}_0, \delta_0\} \), and choose \( h_0^\lambda \) small enough so that \( [\Lambda_1 h_0^\lambda, R_0^0] \neq 0 \). Let \( \varrho_0 \in [\tau \Lambda_1 h_0^\lambda, R_0^0] \) be a radius such that
\[
\Psi(\varrho_0) = \sup_{\tau \Lambda_1 h_0^\lambda \leq \varrho \leq R_0^0} \Psi(\varrho).
\]
If \( \varrho_0 \in [\tau \Lambda_1 h_0^0, \tau R_0^0] \), then by our choice of the parameters
\[
\Psi(\varrho_0) \leq \frac{3}{4} \Psi(\tau^{-1} \varrho_0) + c \tau^{-\lambda} \left\{ \|f\|_{L^{2,\lambda-2}(\Omega_h)}^2 + \|F\|_{L^{2,\lambda}(\Omega_h)}^2 \right\},
\]
and thus
\[
\sup_{\tau \Lambda_1 h_0^\lambda \leq \varrho \leq \tau R_0^0} \Psi(\varrho) \leq 4 c \tau^{-\lambda} \left\{ \|f\|_{L^{2,\lambda-2}(\Omega_h)}^2 + \|F\|_{L^{2,\lambda}(\Omega_h)}^2 \right\}.
\]
If \( \tau R_0^0 \leq \varrho \leq R_0^0 \), then
\[
\sup_{\tau R_0^0 \leq \varrho \leq R_0^0} \Psi(\varrho) \leq \frac{1}{(\tau R_0^0)^\lambda} \int_{\Omega(x_0,R_0^0)} |Du_h|^2 \, dx \leq \frac{c}{(\tau R_0^0)^\lambda} \int_{\Omega} |Du_h|^2 \, dx.
\]
In view of Gårding’s inequality, this easily implies the assertion in case i).
To prove ii), note that \( \omega^2(R) \leq c R^{2\sigma} \) and therefore, in view of part i),
\[
\frac{\omega^2(R)}{R^n} \int_{\Omega(x_0,R)} |Du_h|^2 \, dx \leq \frac{c}{R^{n-2\sigma}} \int_{\Omega(x_0,R)} |Du_h|^2 \, dx \leq c \|Du_h\|_{L^{2,n-2\sigma}(\Omega)}^2 \leq c \left\{ \|u_h\|_{L^2(\Omega)}^2 + \|f\|_{L^{2,n-2\sigma}(\Omega)}^2 + \|F\|_{L^{2,n}(\Omega)}^2 \right\}.
\]
The assertion of the lemma now follows as in case i) with
\[
\Psi(t) = \frac{1}{t^n} \int_{\Omega(x_0,t)} |Du_h - (Du_h)_{x_0,t}|^2 \, dx.
\]
\( \square \)
5. A POINTWISE ESTIMATE AT THE BOUNDARY

The estimate for \( x_0 \in \partial \Omega \) is analogous to the interior estimate in Section 4. However, two arguments need to be modified at the boundary. First, the explicit forms of the Caccioppoli and Campanato inequalities do not seem to be directly available in the literature. We sketch the proofs in the appendix. Secondly, the interpolation operator \( \Pi_{SZ} \) does not map \( W^{1,2}_0(\Omega) \) into \( W^{1,2}_0(\Omega_h) \) and must therefore be suitably modified. To do this, assume that the nodes of the triangulation are given by \( a_i, i = 1, \ldots, N \), where \( a_{L+1}, \ldots, a_N \) are the nodes contained in \( \partial \Omega_h \). Let \( B_h = \{ T \in \mathcal{T}_h : \bar{T} \cap \partial \Omega_h \neq \emptyset \} \) and for \( T \in B_h \) define \( N_0(T) = \{ a_i : a_i \in \bar{T} \cap \partial \Omega_h \} \).

Let \( \Phi_i \) be the standard basis in \( S^h \).

**Lemma 5.1.** Assume that \( \Omega \) is a domain of class \( C^{1,\sigma} \) and \( \Omega_h \) a regular triangulation. Then there exists an interpolation operator \( \Pi_{SZ} \) such that for all \( v \in W^{1,2}_0(\Omega) \) we have \( \Pi_{SZ}(v) \in W^{1,2}_0(\Omega_h) \), \( \Pi_{SZ}(v)|_T = \Pi_{SZ}(v)|_T \) for all \( T \in \mathcal{T}_h \setminus B_h \), and

\[
\int_{\Omega_h} |D\Pi_{SZ}(v) - D\Pi_{SZ}(v)|^2 dx \leq c \int_{\Omega \setminus \Omega_h} |Dv|^2 dx.
\]

**Proof.** This follows with a simple modification of the construction in [SZ]. Recall that \( \Pi_{SZ} \) is defined by (we use the notation from [SZ])

\[
\Pi_{SZ}(v(x)) = \sum_{i=1}^N \Phi_i(x) \int_{\sigma_i} \Psi_i(\xi)v(\xi)d\xi,
\]

where \( \sigma_i \) is an \((n-1)\)–simplex associated with the node \( a_i \). We define

\[
\hat{\Pi}_{SZ}(v(x)) = \sum_{i=1}^L \Phi_i(x) \int_{\sigma_i} \Psi_i(\xi)v(\xi)d\xi.
\]

Clearly \( \hat{\Pi}_{SZ}(v) \in W^{1,2}_0(\Omega_h) \), and \( \Pi_{SZ} \) agrees with \( \Pi_{SZ} \) on all \( T \) with \( N_0(T) = \emptyset \). Assume now that \( N_0(T) \neq \emptyset \). By construction, the \((n-1)\)–simplices \( \sigma_i \) associated with \( a_i \in N_0(T) \) are contained in \( \partial \Omega_h \). Let \( P(\sigma_i) = \{ x + s\nu(\sigma_i) : s > 0, x \in \sigma_i \} \cap \Omega \), where \( \nu(\sigma_i) \) is the outward normal to \( \partial \Omega_h \) on \( \sigma_i \). Since \( v \in W^{1,2}_0(\Omega) \), we may estimate

\[
\int_T |D\Pi_{SZ}(v) - D\Pi_{SZ}(v)|^2 dx \leq \int_T \left( \sum_{a_i \in N_0(T)} |D\Phi_i(x)| \int_{\sigma_i} |\Psi_i(\xi)v(\xi)| d\xi \right)^2 dx
\]

\[
\leq c \sum_{a_i \in N_0(T)} |T||D\Phi_i|_{\infty,T}^2|\Psi_i|_{\infty,\sigma_i}^2|P(\sigma_i)| \int_{P(\sigma_i)} |Dv|^2 dx.
\]

Since \( |D\Phi_i|_{\infty,T} \leq ch^{-1} \), \( |\Psi_i|_{\infty,\sigma_i} \leq ch^{1-n} \), and \( \text{dist}(x, \partial \Omega) \leq ch^{1+\sigma} \) for all \( x \in \sigma_i \), we obtain the assertion of the lemma.

Assume now that \( x_0 \in \partial \Omega \), and choose a domain \( \Omega_0(x_0, R) \) of class \( C^2 \) such that \( \Omega(x_0, R) \subset \Omega_0(x_0, R) \subset \Omega(x_0, 2R) \). Let \( \zeta \) be a smooth cut–off function such that \( \zeta = \Pi_1 \zeta = 0 \) on \( \mathbb{R}^n \setminus \Omega(x_0, \frac{3}{2}R) \), \( \zeta = 1 \) on \( \Omega(x_0, \frac{1}{2}R) \), and \( \|D\zeta\|_{\infty} \leq cR^{-1} \). Finally let \( w \in W^{1,2}(\Omega_0(x_0, R)) \) be the solution of the system with constant coefficients \( A^{\alpha\beta}_{ij}(x_0) \)

\[
a_0(w, \psi) = 0 \quad \forall \psi \in W^{1,2}(\Omega_0(x_0, R)),
\]

\[
w = u_h \quad \text{on } \partial \Omega_0(x_0, R).
\]

(5.1)
We need $w$ to be defined on a smooth domain, since the duality argument in Lemma 5.6 requires the solution of the adjoint problem (5.3) to be globally in $W^{2,2}$. This modification is not necessary in the scalar case, since solutions of elliptic equations in convex domains satisfy this regularity assumption. It seems to be an open question whether an analogous result holds for elliptic systems.

**Lemma 5.2.** Assume that $w$ is the solution of (5.1).

i) *We have the a priori estimate*

$$
\int_{\Omega_0(x_0,R)} |Dw - \xi|^2 dx \leq c \int_{\Omega_0(x_0,R)} |Du_h - \xi|^2 dx \quad \forall \xi \in \mathbb{R}^{mn}.
$$

ii) *Assume that $\Omega$ is a domain of class $C^k$. Then for $k \geq 2$ we have the Caccioppoli estimate*

$$
\int_{\Omega(x_0,\rho)} |D^k w|^2 dx \leq \frac{c}{(R - \rho)^{2(k-1)}} \int_{\Omega(x_0,R)} |Dw - (D\nu(x_0)w)_{x_0,R} \otimes \nu(x_0)|^2 dx + \frac{c}{(R - \rho)^{2(k-2)}} \int_{\Omega(x_0,R)} |Dw|^2 dx.
$$

iii) *Assume that $\Omega$ is a domain of class $C^\ell$ with $\ell \geq k + \frac{n}{2}$. Then we have the pointwise estimate*

$$
\sup_{x \in \Omega(x_0,\rho)} |D^k w|^2 \leq \frac{c}{(R - \rho)^{2(k-1)}} \frac{1}{R^n} \int_{\Omega(x_0,R)} |Dw - (D\nu(x_0)w)_{x_0,R} \otimes \nu(x_0)|^2 dx + \frac{c}{(R - \rho)^{2(k-2)}} \frac{1}{R^n} \int_{\Omega(x_0,R)} |Dw|^2 dx.
$$

*Proof.* The proof of i) is analogous to the corresponding proof in Lemma 4.2, and we give the proof of ii) in the appendix (see Corollary A.4). Finally, iii) is a consequence of ii) and Sobolev's embedding theorem. \qed

We define as before $\psi = \zeta^2(u_h - w)$ and $\psi_h = \Pi_1 \psi$. The global estimate in Lemma 4.3 ii) now holds in the following form: If $\Omega$ is a domain of class $C^k$ with $k \geq 2 + \frac{n}{2}$, then we have the global estimate

$$
\int_{\Omega_h(x_0,R)} |D\psi - D\psi_h|^2 dx \leq \frac{c}{R^2} \int_{\Omega(x_0,R)} |u_h - w|^2 dx + cR^2 \frac{h^2}{R} \int_{\Omega(x_0,R)} |Dw|^2 dx + c \frac{h^2}{R} \int_{\Omega(x_0,R)} |Dw - (D\nu(x_0)w)_{x_0,R} \otimes \nu(x_0)|^2 dx.
$$

(5.2)

We conclude from $\psi_h \in S_h$ that

$$
a(u_h - w, \psi) = a(u_h - w, \psi - \psi_h) + F(\psi_h) - (a - a_0)(w, \psi_h),$$

where we used the equations for $u_h$ and $w$ with $\psi_h$ as test function. The left hand side is estimated as in Lemma 4.4:
Lemma 5.3. Assume that $\Omega$ is a domain of class $C^k$ with $k \geq 2 + \frac{n}{2}$. Then
\[
a(u_h - w, \psi) \geq c \int_{\Omega(x_0, R)} \xi^2 |Du_h - Dw|^2 \, dx - c \frac{1}{R^2} \int_{\Omega(x_0, R)} |u_h - w|^2 \, dx.
\]

In the following lemmas we write $h^{1+\sigma}$ (instead of $h^2$ since $\sigma = 1$) to indicate in which terms we use the fact that the distance to the boundary is of order $h^{1+\sigma}$.

Lemma 5.4. Assume that $\Omega$ is a domain of class $C^k$ with $k \geq 2 + \frac{n}{2}$. Then, for $\varepsilon > 0$,
\[
|a(u_h - w, \psi - \psi_h)| \leq \varepsilon \int_{\Omega(x_0, R)} \xi^2 |Du_h - Dw|^2 \, dx + c \left\{ \int_{\Omega(x_0, R)} |Du_h|^2 \, dx \right\}
\]
\[
+ \frac{h}{R} \int_{\Omega(x_0, 2R)} |Du_h - (D_{\nu(x_0)} u_h)_{x_0, 2R} \otimes \nu(x_0)|^2 \, dx + \left( \frac{h^{1+\sigma}}{R} \right)^{2/n} \int_{\Omega_0(x_0, R)} |Du_h|^2 \, dx.
\]

Proof. By definition
\[
a(u_h - w, \psi - \psi_h) = a_h(u_h - w, \psi - \psi_h) - \int_{(\Omega_1(\Omega_h) \cap \text{spt } \zeta)} A^{\alpha\beta}_{ij} D_\alpha w^i D_\beta (\xi^2 w^j) \, dx.
\]
The first term is estimated as in Lemma 4.5, where we now use the $L^\infty$-estimate in Lemma 5.2 iii). To estimate the terms involving $w$, choose a rotation $Q \in SO(n)$ such that $Q \nu(x_0) = -e_n$, and let $\hat{\Omega}(x_0, R) = Q \Omega(x_0, R)$, $\hat{w}(x) = w(Q^t x)$ and $\hat{u}_h(x) = u_h(Q^t x)$. Then
\[
\int_{\Omega(x_0, R)} |Dw - (D_{\nu(x_0)} w)_{x_0, R} \otimes \nu(x_0)|^2 \, dx = \int_{\hat{\Omega}(x_0, R)} |D\hat{w} - (D_{e_n} \hat{w})_{\hat{\Omega}(x_0, R)} \otimes e_n|^2 \, dx
\]
\[
\leq \int_{\hat{\Omega}(x_0, R)} |D\hat{w} - (D_{e_n} \hat{u}_h)_{\hat{\Omega}(x_0, R)} \otimes e_n|^2 \, dx,
\]
since the mean value minimizes the integral and the resulting term can be estimated by Lemma 5.2. The second term on the right hand side is easily estimated by Hölder’s inequality and Poincaré’s inequality on $(\Omega \setminus \Omega_h) \cap \text{spt } \zeta$. Finally, by the critical Sobolev embedding
\[
\int_{(\Omega \setminus \Omega_h) \cap \text{spt } \zeta} |Dw|^2 \, dx \leq c \left( \frac{h^{1+\sigma}}{R} \right)^{2/n} \left\{ \int_{\Omega(x_0, R)} |Dw|^2 \, dx + cR^2 \int_{\Omega(x_0, \frac{3}{2} R)} |D^2 w|^2 \, dx \right\}
\]
\[
\leq c \left( \frac{h^{1+\sigma}}{R} \right)^{2/n} \int_{\Omega_0(x_0, R)} |Du_h|^2 \, dx.
\]
The assertion of the lemma follows now easily by Lemma 5.2. \qed

Recall that $R_h$ has been defined in (4.1).
Lemma 5.5. Assume that \( \Omega \) is a domain of class \( C^k \) with \( k \geq 2 + \frac{n}{2} \). Then, for \( \varepsilon > 0 \),

\[
|F(\psi_h) - (a - a_0)(w, \psi_h)| \leq \varepsilon \left\{ \omega^2(R) \int_{\Omega(x_0, R)} |Du_h|^2 \, dx + \mathcal{R}_h(F, f; R) \right\}
\]
\[
+ \varepsilon \left\{ \int_{\Omega(x_0, R)} \zeta^2 |Du_h - Dw|^2 \, dx + \frac{1}{R^2} \int_{\Omega(x_0, R)} |u_h - w|^2 \, dx \right. \]
\[
+ \left. \frac{h}{R} \int_{\Omega(x_0, 2R)} |Du_h - (D_{\nu(x_0)}u_h)_{x_0, 2R} \otimes \nu(x_0)|^2 \, dx \right\}.
\]

Proof. This is analogous to the proof of Lemma 4.6, where we now use the global estimate (5.2).

The estimate for \( u_h - w \) is based on a duality argument as in Section 4.

Lemma 5.6. There exists a constant \( \Lambda > 0 \) such that for all \( R \geq \Lambda h \) the following inequality holds:

\[
\int_{\Omega_0(x_0, R)} |u_h - w|^2 \, dx \leq \eta \left( \frac{h}{R} \right)^2 \int_{\Omega_0(x_0, R)} |Du_h - Dw|^2 \, dx
\]
\[
+ cR^2 \left\{ \omega^2(R) + h^{2\sigma/n} \right\} \int_{\Omega_0(x_0, 2R)} |Du_h|^2 \, dx + \mathcal{R}_h(F, f; 2R) \}.
\]

Proof. Choose a smooth domain \( \Omega_1(x_0, R) \) such that \( \Omega_1(x_0, R) \subset \Omega_0(x_0, R) \) and such that there exists a cut-off function \( \tau \) with the following properties: \( \tau = \Pi_{SZ} \tau = 0 \) on \( \mathbb{R}^n \setminus \Omega_0(x_0, R) \), \( \tau = 1 \) on \( \Omega_1(x_0, R) \), and \( |D^i \tau| \leq ch^{-i} \) for \( i = 0, 1, 2 \). Moreover we may assume that \( |\Omega_0(x_0, R) \setminus \Omega_1(x_0, R)| \leq ch^n - 1 \). Let \( z \in W^{1,2}_0(\Omega_0(x_0, R)) \) be the solution of the adjoint system

\[
-D_{\alpha}(A_{\beta j}^{\alpha j}D_{\beta z^j}) = u_h^i - w^i.
\]

Then \( z \in W^{2,2}(\Omega_0(x_0, R)) \) (see, e.g., [Gi]) and

\[
||z||_2 + R||Dz||_2 + R^2||D^2z||_2 \leq cR^2||u_h - w||_2
\]

(see the norms being taken on \( \Omega_0(x_0, R) \)). As in the proof of Lemma 4.7 with \( \Pi_{SZ} \) replaced by \( \hat{\Pi}_{SZ} \) we obtain

\[
\int_{\Omega_0(x_0, R)} |u_h - w|^2 \, dx = \int_{\Omega_0(x_0, R)} A_{\beta j}^{\alpha j}D_{\beta z^j}D_{\alpha}(u_h^i - w^i)(1 - \tau) \, dx
\]
\[
- \int_{\Omega_0(x_0, R)} A_{\beta j}^{\alpha j}D_{\beta \tau z^j}D_{\alpha}(u_h^i - w^i) \, dx - \int_{\Omega_0(x_0, R)} A_{\beta j}^\alpha D_{\beta w^j}D_{\alpha}(\tau z^i) \, dx
\]
\[
+ a_h(u_h - w, \tau z - \hat{\Pi}_{SZ}(\tau z)) - (a - a_0)(w, \hat{\Pi}_{SZ}(\tau z)) + \mathcal{F}(\hat{\Pi}_{SZ}(\tau z)).
\]

Denote the terms on the right hand side by \( I - VI \); we estimate them separately using the inequalities

\[
\int_{\Omega_0(x_0, R) \setminus \Omega_1(x_0, R)} |D(\tau z)|^2 \, dx \leq cR^2 \left( \frac{h}{R} \right)^{2/n} \int_{\Omega_0(x_0, R)} |u_h - w|^2 \, dx
\]
and

\[(5.6) \quad \int_{\Omega \setminus \Omega_h} |D(\tau z)|^2 dx \leq cR^2 \left( \frac{h^{1+\sigma}}{R} \right)^{2/n} \int_{\Omega_h \setminus \Omega_{(x_0, R)}} |u_h - w|^2 dx,\]

which follow from Poincaré’s inequality, the Sobolev embedding and the a priori estimate (5.4). Now

\[|I| \leq (mn)|A|_\infty \left( \int_{\Omega_{(x_0, R)} \setminus \Omega_{(x_0, R)}} |Dz|^2 dx \right)^{1/2} \left( \int_{\Omega_{(x_0, R)}} |Du_h - Dw|^2 dx \right)^{1/2}\]

and

\[|II| \leq (mn)|A|_\infty |D\tau|_\infty \left( \int_{\text{spt } D\tau} |z|^2 dx \right)^{1/2} \left( \int_{\Omega_{(x_0, R)}} |Du_h - Dw|^2 dx \right)^{1/2}\]

are easily estimated. For III we obtain

\[|III| \leq c(mn)|A|_\infty \left( \int_{\Omega_{(x_0, R)}} |Dw|^2 dx \right)^{1/2} \left( \int_{\Omega_{(x_0, R)}} \left( \frac{h^{1+\sigma}}{R} \right)^{1/n} \left( \int_{\Omega_{(x_0, R)}} |u_h - w|^2 dx \right)^{1/2} \right)^2,
\]

and this can be estimated by Young’s inequality. To bound the remaining terms IV – VI we use the fact that by Lemma 5.1 and (5.6)

\[
\int_{\Omega} |\Pi_{SZ}(\tau z) - \hat{\Pi}_{SZ}(\tau z)|^2 dx \leq c h^2 \int_{\Omega \setminus \Omega_h} |D(\tau z)|^2 dx
\]

\[
\leq c h^{\sigma(1+2/n)} R^2 \left( \frac{h}{R} \right)^{2/n} \int_{\Omega_{(x_0, R)}} |u_h - w|^2 dx.
\]

The assertion follows easily.

The above lemmas prove the following Campanato inequality for $u_h$ at the boundary. The proof is identical to the proof of Lemma 4.1.

**Lemma 5.7.** Assume that $\Omega$ is a domain of class $C^k$ with $k \geq 2 + \frac{n}{2}$. Then there exists a constant $\Lambda > 0$ such that for all $h \leq \varrho \leq R \leq R_0$ and $R \geq \Lambda h$ the following inequalities hold:

\[
\int_{\Omega_{(x_0, \varrho)}} |Du_h|^2 dx \leq c \left\{ \left( \frac{\theta}{R} \right)^n + \omega^2(R) + \eta^2(R) + h^{2\sigma/n} \right\} \int_{\Omega_{(x_0, 2R)}} |Du_h|^2 dx + cR_k(F, f; 2R),
\]

License or copyright restrictions may apply to redistribution; see http://www.ams.org/journal-terms-of-use
\[
\int_{\Omega(x_0, \varrho)} |Du_h - (D_{\nu(x_0)}u_h)_{x_0, \varrho} \otimes \nu(x_0)|^2 \, dx \\
\leq c \left( \frac{\varrho}{R} \right)^{n+2} + \eta \left( \frac{h}{R} \right) \int_{\Omega(x_0, 2R)} |Du_h - (D_{\nu(x_0)}u_h)_{x_0, R} \otimes \nu(x_0)|^2 \, dx \\
+ c \left( h \nu + h^{2\sigma} \right) \int_{\Omega(x_0, 2R)} |Du_h|^2 \, dx + cR_h(F, f; 2R).
\]

Here \( \Lambda \) is independent of \( x_0, h, \varrho, R, u, u_h \), while \( \eta \) is a nonnegative, continuous function such that \( \eta(t) \leq c t^{1/n} \) for \( n \geq 3 \) and \( \eta(t) \leq c(\mu)t^{\mu} \) for all \( \mu \in (0, \frac{1}{2}) \) for \( n = 2 \).

We obtain from this Campanato inequality the following estimate at the boundary:

**Proposition 5.8.** Assume that \( \Omega \) is a domain of class \( C^k \) with \( k \geq 2 + \frac{n}{2} \), \( \Omega_h \) a regular triangulation and \( u_h \) the solution of (2.6). Let \( x_0 \in \partial \Omega \).

i) Let \( \lambda \in (0, n) \). Assume that \( A_{ij}^{\alpha \beta} \in C(\Omega), f \in L^{2, \lambda-2}(\Omega_h) \) and \( F \in L^{2, \lambda}(\Omega_h) \). Then there exist constants \( R_1^1, h_1^1, c_1 > 0 \), which depend only on \( \Omega, n, \lambda, \) and \( A \), such that for \( h \leq h_1^1 \)

\[
\sup_{h < \varrho \leq R_1^1} \frac{1}{\varrho^n} \int_{\Omega(x_0, \varrho)} |Du_h|^2 \, dx \\
\leq c_1 \left( \|u_h\|_{2, \Omega_h}^2 + \|f\|_{L^{2, \lambda-2}(\Omega_h)}^2 + \|F\|_{L^{2, \lambda}(\Omega_h)}^2 \right).
\]

ii) If \( A_{ij}^{\alpha \beta} \in C^{0, \sigma}(\Omega) \) for some \( \sigma > 0 \), \( f \in L^{2, \sigma - 2}(\Omega_h) \) and \( F \in L^{2, \sigma}(\Omega_h) \), then there exist constants \( R_1^1, h_1^1, c_1 > 0 \), which depend only on \( \Omega, n, \sigma, \) and \( A \), such that for \( h \leq h_1^1 \)

\[
\sup_{h < \varrho \leq R_1^1} \frac{1}{\varrho^n} \int_{\Omega(x_0, \varrho)} |Du_h - (Du_h)_{x_0, \varrho}|^2 \, dx \\
\leq c_1 \left( \|u_h\|_{2, \Omega_h}^2 + \|f\|_{L^{2, \sigma-2}(\Omega_h)}^2 + \|F\|_{L^{2, \sigma}(\Omega_h)}^2 \right).
\]

**Proof.** The proof is analogous to the proof of Proposition 4.8. In the proof of i) we choose \( h_1^1 \) small enough so that \( c(h_1^1)^{2/n} \leq \frac{1}{R} \), while in the proof of ii) we use the inequality \( h \leq R \). Thus we obtain

\[
\sup_{h < \varrho \leq R_1^1} \frac{1}{\varrho^n} \int_{\Omega(x_0, \varrho)} |Du_h - (D_{\nu(x_0)}u_h)_{x_0, \varrho} \otimes \nu(x_0)|^2 \, dx \\
\leq c_1 \left( \|u_h\|_{2, \Omega_h}^2 + \|f\|_{L^{2, \sigma-2}(\Omega_h)}^2 + \|F\|_{L^{2, \sigma}(\Omega_h)}^2 \right).
\]

The proposition follows since the mean value minimizes the integral on the left hand side. \( \square \)

6. Error estimates in Campanato spaces

The estimates in Sections 4–5 imply the following stability result.

**Theorem 6.1.** Assume that \( \Omega \) is a domain of class \( C^k \) with \( k \geq 2 + \frac{n}{2} \), \( \Omega_h \) a regular triangulation and \( u_h \) a solution of (2.6).
i) Let $\lambda \in (0, n)$. Assume that $A_{ij}^{0\beta} \in C^{0} (\bar{\Omega})$, $f \in L^{2,\lambda-2} (\Omega_h)$ and $F \in L^{2,\lambda} (\Omega_h)$. Then there exists a constant $c_\lambda > 0$, which depends only on $\Omega$, $n$, $\lambda$, and $A$, such that
\[
\|Du_h\|_{L^{2,\lambda} (\Omega_h)} \leq c_\lambda \left( \|u_h\|_{2;\Omega} + \|f\|_{L^{2,\lambda-2} (\Omega_h)} + \|F\|_{L^{2,\lambda} (\Omega_h)} \right).
\]
i) If $A_{ij}^{0\beta} \in C^{0,\sigma} (\bar{\Omega})$ for some $\sigma > 0$, $f \in L^{2,n-2} (\Omega_h)$ and $F \in L^{2,n} (\Omega_h)$, then there exists a constant $c_n > 0$, which depends only on $\Omega$, $n$, $\sigma$, and $A$, such that
\[
\|Du_h\|_{L^{2,n} (\Omega_h)} \leq c_n \left( \|u_h\|_{2;\Omega} + \|f\|_{L^{2,n-2} (\Omega_h)} + \|F\|_{L^{2,n} (\Omega_h)} \right).
\]
iii) If the system (2.3) has a unique solution, then the estimates in i) and ii) hold without the norm of $u_h$ on the right hand side.
iv) If the system has a unique solution, then the Ritz projection is stable in Morrey and Campanato spaces: under the assumptions in i) and ii) we have
\[
\|Du_h\|_{L^{2,\lambda} (\Omega_h)} \leq c_{\lambda} \|Du\|_{L^{2,\lambda} (\Omega_h)}
\]
and
\[
\|Du_h\|_{L^{2,n} (\Omega_h)} \leq c_n \|Du\|_{L^{2,n} (\Omega_h)}.
\]

Proof: To prove i), let $\bar{R} = \min \{ R^0_\chi, \frac{1}{2} R^1_\chi \}$ and assume that $h \leq \min \{ h^0_\chi, h^1_\chi \}$. We first show that
\[
\sup_{x_0 \in \Omega} \sup_{h \leq \bar{R}} \frac{1}{\Omega(x_0, R)} \int_{\Omega(x_0, R)} |Du_h|^2 \, dx \leq c \left( \|u_h\|_{2;\Omega}^2 + \|f\|_{L^{2,\lambda-2} (\Omega_h)}^2 + \|F\|_{L^{2,\lambda} (\Omega_h)}^2 \right).
\]
This inequality follows from the interior estimate in Proposition 4.8 and the estimate at the boundary if $\Omega(x_0, R) \subset \Omega$ or $x_0 \in \partial \Omega$, respectively. Assume now that $\Omega(x_0, R) \cap \partial \Omega \neq \emptyset$ and $x_0 \notin \partial \Omega$. Choose a point $\bar{x}_0 \in \partial \Omega$ such that $|x_0 - \bar{x}_0| = \text{dist}(x_0, \partial \Omega)$. Since
\[
\frac{1}{\Omega(x_0, R)} \int_{\Omega(x_0, R)} |Du_h|^2 \, dx \leq \frac{c}{(2R)^\lambda} \int_{\Omega(\bar{x}_0, 2R)} |Du_h|^2 \, dx,
\]
we conclude this proof using again the boundary estimate in Proposition 4.8. The assertion of case i) now follows easily from Lemma 3.4. The proof of ii) is analogous, and iii) follows from Theorem 3.1. To prove iv), define $F^\alpha_i = A_{ij}^{0\beta} D^\beta_i u^j$ and note that $F \in L^{2,\lambda} (\Omega)$ ($F \in L^{2,n} (\Omega)$) if $Du \in L^{2,\lambda} (\Omega)$ ($Du \in L^{2,n} (\Omega)$). This follows from the fact that $L^\infty (\Omega)$ and $C^{0,\sigma} (\bar{\Omega})$ are multipliers in $L^{2,\lambda} (\Omega)$ and $L^{2,n} (\Omega)$, respectively. The assertion is now an immediate consequence of the a priori estimates in i) and ii).

The following optimal error estimates are an immediate consequence of Theorem 6.1.

**Theorem 6.2.** Assume that $\Omega$ is a domain of class $C^k$ with $k \geq 2 + \frac{n}{2}$, $\Omega_h$ a regular triangulation, and $u$ and $u_h$ the unique solutions of the system (2.5) and the finite element equation (2.6), respectively. Define $e_h = u - u_h$. 

i) Let $\lambda \in [0, n)$. Assume that $A_{ij}^{\alpha \beta} \in C^0(\bar{\Omega})$, $f \in L^{2, \lambda - 2}(\Omega_h)$ and $F \in L^{2, \lambda}(\Omega_h)$. Then there exists a constant $c_\lambda > 0$, which depends only on $\Omega$, $n$, $\lambda$, and $A$, such that
\[
\|Dc_h\|_{L^{2, \lambda}(\Omega_h)} \leq c_\lambda \inf_{w_h \in S_h^0} \|Du - Dw_h\|_{L^{2, \lambda}(\Omega_h)}.
\]

ii) Let $\lambda \in (n - 2, n)$. Assume that $A_{ij}^{\alpha \beta} \in C^1(\bar{\Omega})$, $f \in L^{2, \lambda}(\Omega_h)$ and $F \in W^{1, 2}(\bar{\Omega})$ with $DF \in L^{2, \lambda}(\Omega_h)$. Then there exists a constant $c_\lambda > 0$, which depends only on $\Omega$, $n$, $\lambda$, and $A$, such that we have the optimal estimate
\[
\|Dc_h\|_{L^{2, \lambda}(\Omega_h)} \leq c_\lambda \|Du - Dw_h\|_{L^{2, \lambda}(\Omega_h)}.
\]

iii) If $A_{ij}^{\alpha \beta} \in C^{0, \sigma}(\bar{\Omega})$ for some $\sigma > 0$, $f \in L^{2, n-2}(\Omega_h)$ and $F \in L^{2, n}(\Omega_h)$, then there exists a constant $c_n > 0$, which depends only on $\Omega$, $n$, $\sigma$, and $A$, such that
\[
\|Dc_h\|_{L^{2, n}(\Omega_h)} \leq c_n \inf_{w_h \in S_h^0} \|Du - Dw_h\|_{L^{2, n}(\Omega_h)}.
\]

iv) If $A_{ij}^{\alpha \beta} \in C^{1, \sigma}(\bar{\Omega})$ for some $\sigma > 0$, $f \in L^{2, \lambda}(\Omega_h)$ for some $\lambda \in (n, n + 2]$ and $F \in W^{1, 2}(\Omega)$ with $DF \in L^{2, \lambda}(\Omega_h)$, then there exists a constant $c_n > 0$, which depends only on $\Omega$, $n$, $\sigma$, and $A$, such that
\[
\|Dc_h\|_{L^{2, n}(\Omega_h)} \leq c_n \|Du - Dw_h\|_{L^{2, \lambda}(\Omega_h)}.
\]

Remarks. 1) The system (2.3) has for example a unique solution if the coefficients are constant or if the coefficients $A_{ij}^{\alpha \beta}$ satisfy the Legendre condition, i.e., there exists a constant $c > 0$ such that $A_{ij}^{\alpha \beta}(x)\xi_i \xi_j \geq c|\xi|^2$ for all $\xi \in \mathbb{R}^m$ and all $x \in \Omega$.

2) The slightly stronger assumptions in part (iv) of Theorem 6.2 compared with Theorem 6.1 (ii) are needed in order to ensure that $D^2u \in L^\infty$. In fact, $D^2u \in C^{0, \sigma}$ with $\sigma = \frac{\lambda - n}{2}$; see Section 3.

Proof. We first prove (i). For $w_h \in S_h^0$ define $F^\alpha_i = A_{ij}^{\alpha \beta} D_\beta(w^j - w_h^j)$, and let $v_h$ be the finite element solution of (2.3) with $F = (F^\alpha_i)$ and $f = 0$. By Theorem 6.1
\[
\|Du_h\|_{L^{2, \lambda}(\Omega_h)} \leq c\|Du - Dw_h\|_{L^{2, \lambda}(\Omega_h)}.
\]

Since the solutions of the system (2.3) are unique, $v_h = R(u - w_h)$ is the Ritz projection of $u - w_h$, and this estimate implies
\[
\|Du_h - Dw_h\|_{L^{2, \lambda}(\Omega_h)} \leq c\|Du - Dw_h\|_{L^{2, \lambda}(\Omega_h)}.
\]

The proof follows now from the triangle inequality:
\[
\|Du - Du_h\|_{L^{2, \lambda}(\Omega_h)} \leq \|Du - Dw_h\|_{L^{2, \lambda}(\Omega_h)} + \|Du_h - Dw_h\|_{L^{2, \lambda}(\Omega_h)}.
\]

To prove (ii), we have to show that for $\lambda \in (n - 2, n)$ the estimate
\[
\|Du - D\Pi_{SZ}u\|_{L^{2, \lambda}(\Omega_h)} \leq c\|D^2u\|_{L^{2, \lambda}(\Omega_h)}
\]
holds. In view of Poincaré’s inequality, we deduce that $Du \in L^{2,\lambda+2}$, and thus $Du \in C^{0,\sigma}(\bar{\Omega})$ with $\sigma = \frac{\lambda + 2 - n}{2}$. Hence for $0 < \varrho < h$ we obtain

$$
\frac{1}{\varrho^\lambda} \int_{\Omega_h(x_0, \varrho)} |Du - D\Pi_{SZ} u|^2 dx
\leq \frac{c}{\varrho^\lambda} \int_{\Omega_h(x_0, \varrho)} |Du - Du(x_0)|^2 dx + \frac{c}{\varrho^\lambda} \int_{\Omega_h(x_0, \varrho)} |D\Pi_{SZ} u - Du(x_0)|^2 dx.
$$

With $\bar{x}_0$ and $\bar{\varrho}$ defined as in Lemma 3.4, we conclude that

$$
\frac{c}{\bar{\varrho}^\lambda} \int_{\Omega_h(x_0, \bar{\varrho})} |Du - Du(x_0)|^2 dx
\leq \frac{c}{\bar{\varrho}^\lambda} \int_{\Omega_h(\bar{x}_0, \bar{\varrho})} |D\Pi_{SZ} u - Du|^2 dx + \frac{c}{\bar{\varrho}^\lambda} \int_{\Omega_h(\bar{x}_0, \bar{\varrho})} |Du - Du(x_0)|^2 dx.
$$

Since $Du \in C^{0,\sigma}(\bar{\Omega})$, we get

$$
\frac{c}{\bar{\varrho}^\lambda} \int_{\Omega_h(x_0, \bar{\varrho})} |Du - Du(x_0)|^2 dx \leq c\varrho^{n-\lambda+2\sigma}\|D^2 u\|_{L^{2,\lambda}(\Omega_h)}^2 \leq c\varrho^2\|D^2 u\|_{L^{2,\lambda}(\Omega_h)}^2
$$

and a similar inequality for the integral over $\Omega(\bar{x}_0, \bar{\varrho})$. This proves $ii$), since we may use the interpolation property of $\Pi_{SZ}$ on balls with radii of order $h$. The proof of $iii$) is similar. Finally, $iv$) follows since $u \in W^{2,\infty}(\Omega)$ implies

$$
\sup_{x \in \Omega} \sup_{0 < R \leq \text{diam}(\Omega)} \frac{1}{R^n} \int_{\Omega_h(x_0, R)} |Du - D\Pi_1 u|^2 dx \leq c\varrho^2\|D^2 u\|_{L^{2,\lambda}(\Omega_h)}^2.
$$

7. Uniform estimates

As a further application of the $L^{2,n}$ estimates in Theorem 6.2 we show in this section how one can deduce from these estimates an optimal $L^\infty$ estimate. This generalizes the famous results in [RS] to systems in arbitrary dimensions. The case of an elliptic equation in arbitrary dimensions has recently been solved in [SW2]. The methods employed in this section were first used in [DF].

**Theorem 7.1.** Assume that $\Omega$ is a domain of class $C^k$ with $k \geq 2 + \frac{n}{2}$, $\Omega_h$ a regular triangulation, and that $u$ and $u_h$ are the unique solutions of the system (2.5) and the finite element equation (2.6), respectively. Define $e_h = u - u_h$. If $A^{ij}_{ij} \in C^{2,\sigma}(\bar{\Omega})$ for some $\sigma > 0$, $f \in L^{2,\lambda}(\Omega_h)$, and $F \in W^{1,2}(\Omega)$ is such that $DF \in L^{2,\lambda}(\Omega_h)$ with $\lambda \in (n, n + 2]$, then

$$
\|De_h\|_{L^{\infty};\Omega_h} \leq c\|D^2 u\|_{L^{2,\lambda}(\Omega_h)}
$$

for all $\Omega_0 \subset \subset \Omega$.

**Proof.** We restrict ourselves to the case of interior estimates for systems with constant coefficients; the proof with $C^{2,\sigma}$ coefficients is similar, since the corresponding Green’s function has the same growth properties, see [F], [DM]. We give the arguments for $n \geq 3$; for $n = 2$ one uses the logarithmic Green’s function. The key
point in the argument is to use a differentiated Green’s function as introduced in [RS].

Assume that $\|De_h\|_{\infty; \Omega} = Ds e_h(x_0)$, where $x_0 \in T_0 \in T_h$. Choose $\hat{x}_0 \in T_0$ such that $\Omega(\hat{x}_0, \sigma_0 h) \subset T_0$, and let $\hat{e}_h = \Pi u - u_h$. In view of the interpolation estimate,

$$|Ds e_h(x_0)| \leq |Ds e_h^{k}(x_0)| + |Ds (u^k - \Pi u^k)(x_0)| \leq |Ds e_h(x_0)| + \mathcal{O}(h),$$

and thus it suffices to estimate $Ds e_h(x_0)$. Choose a smooth function $\delta \geq 0$ with support in $\Omega(\hat{x}_0, \sigma_0/2)$ and $\int_\Omega \delta dx = 1$. Denote by $G = G(x, y) \in W_h^{1,2}(\Omega)$ the solution of the elliptic system

$$-D_\alpha (A_{ij}^{\beta\alpha} D_\beta G^i) = -\delta_{ik} \delta_h,$$

where $\delta_h = h^{-n} \delta(\frac{x-y}{h})$. Taking the derivative with respect to $x$, we obtain a solution $G_s = D_s G$ of the system

$$-D_\alpha (A_{ij}^{\beta\alpha} D_\beta G_s^i) = -\delta_{ik} D_s \delta_h.$$ 

With $y = \hat{x}_0$ we deduce by standard $L^2$ estimates that

$$\int_{\Omega(\hat{x}_0, \sigma h)} |DG_s|^2 dx \leq c_h h^{-n},$$

$$\int_{\Omega(\hat{x}_0, \sigma h)} |D^2 G_s|^2 dx \leq c_h h^{-n-2},$$

for $\sigma \leq \sigma_0$, and a slight generalization of the estimates for elliptic systems in [F] (see also [DM]) shows that the following pointwise estimates hold on $\Omega \setminus \Omega(\hat{x}_0, \sigma_0 h)$:

$$|G_s| \leq c|x - \hat{x}_0|^{1-n},$$

$$|DG_s| \leq c|x - \hat{x}_0|^{-n},$$

$$|D^2 G_s| \leq c|x - \hat{x}_0|^{-n-1}.$$ 

Fix $0 < R_0 < \text{dist}(\Omega_0, \partial\Omega)/2$, and choose a cut-off function $\tau_0$ such that $\tau_0 = 1$ on $\Omega(x_0, R_0/2)$, $\tau_0 = \Pi_{S^2} \tau_0 = 0$ on $\mathbb{R}^n \setminus \Omega(x_0, R_0)$ and $|D^i \tau_0| \leq c R_0^{-i}$ for $i = 1, 2$. Then

$$(7.1) \quad D_s e_h^{k}(\hat{x}_0) = a_h(\tau_0 e_h, G_s) = a_h(e_h, \tau_0 G_s) + a_h(\tau_0 (\Pi_1 u - u), G_s) + \int_{\Omega_h} A_{ji}^{\beta\alpha} D_\beta G_s^i (D_\alpha \tau_0) e_h^i dx - \int_{\Omega_h} A_{ji}^{\beta\alpha} (D_\beta \tau_0) G_s^i D_\alpha e_h^i dx.$$

Using integration by parts and the estimates for $G_s$, we see that the second term on the right-hand side in (7.1) is of order $\mathcal{O}(h)$. It is here that we use the full strength of the differentiated Green’s function. Since $\tau_0 = 1$ on $\Omega(\hat{x}_0, R_0/2)$, the two integrals involving $D_\tau \tau_0$ in (7.1) are estimated in view of the $W^{1,2}$ estimates for $e_h$. Let $\psi = \tau_0 G_s$ and $\psi_h = \Pi_{S^2} \psi$. By the orthogonality of the Ritz projection we conclude from (7.1) that

$$D_s e_h^{k}(\hat{x}_0) = \int_{\Omega_h} A_{ji}^{\beta\alpha} D_\beta e_h^i D_\alpha (\psi^i - \psi_h^i) dx + \mathcal{O}(h).$$

To estimate the remaining integral, we define a family of balls $\Omega(\hat{x}_0, R_\ell)$ with $R_\ell = 2^{-\ell} R_0$, $\ell = 0, 1, 2, \ldots, L$, such that $R_L \leq h < R_{L-1}$, and corresponding cut-off functions $\tau_\ell$ such that $\sum \tau_\ell = 1$ on $\Omega(\hat{x}_0, R_0)$ and

$$\text{spt}(\tau_\ell) \subset \Omega(\hat{x}_0, R_{\ell-1}) \setminus \Omega(\hat{x}_0, R_{\ell+1}).$$
Then
\[ \int_{\Omega_h} A^{\alpha\beta}_{ij} D_{\beta} e^i_{\ell} D_{\alpha} (\psi^j - \psi^j_h) dx = \sum_{\ell=1}^L \int_{\Omega_h} A^{\alpha\beta}_{ij} (D_{\beta} e^i_{\ell} - (D_{\beta} e^i_{\ell})_{\partial_0, R}) D_{\alpha} (\tau_{\ell}(\psi^j - \psi^j_h)) dx. \]

In view of the $L^2$-estimate for $D e_h$ this is estimated by
\[ c \sum_{\ell=1}^L h R_{\ell}^{n/2} \|D_{\alpha} (\tau_{\ell}(\psi^j - \psi^j_h))\|_{2;\Omega(\partial_0, R)}. \]

Invoking again the estimates for $G_s$, we obtain
\[ \|D e_h\|_{\infty; \Omega} \leq c h^2 \|D^2 u\|_{\infty; \Omega} \sum_{\ell=1}^L R_{\ell}^{-1} + O(h) = O(h), \]
and this proves the assertion of the theorem. \hfill \Box

**Appendix**

The following lemmas contain estimates for solutions of elliptic systems which do not seem to be directly available in the literature. The proofs use standard techniques and are included for the convenience of the reader.

**Lemma A.1.** Assume that $A^{\alpha\beta}_{ij} \in C^1(B^+(0, 2R))$ and that $v \in C^2(B^+(0, 2R))$ is a solution of
\[ D_{\alpha} (A^{\alpha\beta}_{ij} D_{\beta} v^j) = 0 \]
with $v = 0$ on $\partial B^+(0, 2R) \cap \{x_n = 0\}$. Then
\[ \int_{B^+(0, R)} |D^2 v|^2 dx \leq \frac{c}{R^2} \int_{B^+(0, 2R)} |Dv - \xi \otimes e_n|^2 dx + c R^n |\xi|^2 \]
for all $\xi \in \mathbb{R}^m$.

**Proof.** Let $\zeta \in C_0^\infty(\mathbb{R}^n)$ be a cut-off function such that $\zeta \equiv 1$ on $B(0, R)$, $\zeta \equiv 0$ on $\mathbb{R}^n \setminus B(0, 2R)$ and $|D\zeta| \leq c R^{-1}$ with a constant independent of $R$. Define $w = \zeta (v - x_n \xi)$. Then $D_{\beta} w = \zeta (D_{\beta} v - \delta_{\beta n} \xi) + D_{\beta} \zeta (v - x_n \xi)$ and
\[ D_{\alpha} (A^{\alpha\beta}_{ij} D_{\beta} w^j) = (-\zeta) D_{\alpha} A^{\alpha\beta}_{ij} \delta_{\beta n} \xi^j + D_{\alpha} A^{\alpha\beta}_{ij} (D_{\beta} v^j - \delta_{\beta n} \xi^j) + D_{\alpha} (A^{\alpha\beta}_{ij} D_{\beta} \zeta (v^j - x_n \xi)) \]
\[ = f_i + D_{\alpha} F^{\alpha}_{i} \]
with
\[ f_i = (-\zeta) D_{\alpha} A^{\alpha\beta}_{ij} \delta_{\beta n} \xi^j + (D_{\alpha} \zeta^j) A^{\alpha\beta}_{ij} (D_{\beta} v^j - \delta_{\beta n} \xi^j) \]
and
\[ F^{\alpha}_{i} = A^{\alpha\beta}_{ij} D_{\beta} \zeta (v^j - x_n \xi). \]

It follows from standard results in elliptic regularity (see, e.g., [Gi], p. 363) that
\[ \int_{B^+(0, R)} |D^2 w|^2 dx \leq \frac{c}{R^2} \int_{B^+(0, 2R)} |Dw|^2 dx + c \int_{B^+(0, 2R)} (|DF|^2 + |f|^2) dx. \]
Together with Poincaré’s inequality
\[ \int_{B^+(0,2R)} |v - x_n \xi|^2 dx \leq \frac{c}{R^2} \int_{B^+(0,2R)} |Dv - \xi \otimes \epsilon_n|^2 dx, \]
this easily implies the assertion of the lemma. \[ \square \]

**Lemma A.2.** Assume that \( k \geq 3 \), \( A^{ij}_{ij}, F^a_i \in C^{k-1}(B^+(0,R_0)) \), and that \( v \in W^{1,2}(B^+(0,R_0)) \cap C^k(B(0,R_0)) \) is the solution of
\[ D_\alpha(A^{ij}_{ij} D_\beta v^j) = D_\alpha F^a_i \]
with \( v = 0 \) on \( \partial B^+(0,R_0) \cap \{x_n = 0\} \). Then there exists a constant \( c \), which depends only on \( k \) and \( \|A^{ij}_{ij}\|_{C^{k-1}(B^+(0,R_0))} \), such that for all \( 0 < q < R < R_0 \) (here we choose \( R_0 \) small enough so that we may apply Gårding’s inequality)
\[ (A.1) \int_{B^+(0,\rho)} |D^k v|^2 dx \leq c \left\{ (R - \rho)^{-2} \int_{B^+(0,R)} |D^2 v|^2 dx + \int_{B^+(0,R)} |Dv|^2 dx + \int_{B^+(0,R)} |D^2 F|^2 dx \right\}. \]

**Proof.** We argue by induction. Assume first that \( k = 3 \). We have to show that
\[ \int_{B^+(0,\rho)} |D^3 v|^2 dx \leq c \left( (R - \rho)^{-2} \int_{B^+(0,R)} |D^2 v|^2 dx + \int_{B^+(0,R)} |Dv|^2 dx + \int_{B^+(0,R)} |D^2 F|^2 dx \right). \]
For \( \sigma \in \{1, \ldots, n-1\} \) let \( v_\sigma = D_\sigma v \). Then \( v_\sigma \) is a solution of
\[ (A.2) \quad D_\alpha(A^{ij}_{ij} D_\beta v^j) = D_\alpha(D_\sigma F^a_i - D_\sigma A^{ij}_{ij} D_\beta v^j) = D_\alpha G^\sigma_i \]
with \( G^\sigma_i = D_\sigma F^a_i - D_\sigma A^{ij}_{ij} D_\beta v^j \) and \( v_\sigma = 0 \) on \( \partial B^+(0,R_0) \cap \{x_n = 0\} \). It follows from standard regularity results in elliptic theory (see, e.g., [Gi], p. 363) that
\[ \int_{B^+(0,\rho)} |D^2 v_\sigma|^2 dx \leq c \left( (R - \rho)^{-2} \int_{B^+(0,R)} |Dv|^2 dx + \int_{B^+(0,R)} |DG|^2 dx \right). \]
By the definition of \( G^\sigma_i \) and \( v_\sigma \),
\[ \int_{B^+(0,\rho)} |D^2 D_\sigma v|^2 dx \leq c \left( (R - \rho)^{-2} \int_{B^+(0,R)} |D^2 v|^2 dx + \int_{B^+(0,R)} |Dv|^2 dx + \int_{B^+(0,R)} |D^2 F|^2 dx \right). \]
Rearranging the terms in the pointwise form of the differential equation, we obtain
\[ (A.3) \quad A^{nn}_{ij} D_{nn} v^j = D_\alpha F^a_i - D_\alpha A^{ij}_{ij} D_\beta v^j - \sum_{(\alpha,\beta) \neq (n,n)} A^{ij}_{ij} D_\alpha v^j, \]
and thus
\[ A^{nn}_{ij} D_{nn} v^j = - D_n A^{nn}_{ij} D_{nn} v^j + D_n[D_\alpha F^a_i - D_\alpha A^{ij}_{ij} D_\beta v^j - \sum_{(\alpha,\beta) \neq (n,n)} A^{ij}_{ij} D_\alpha v^j]. \]
It follows from the Legendre-Hadamard condition (2.4) that the matrix \( (A^{nn}_{ij}) \) has a uniformly bounded inverse. Therefore we can solve the equation for \( D_{nn} v \) and
obtain the assertion of the lemma for \( k = 3 \), since all terms on the right hand side are estimated.

Assume now that the assertion holds for \( k-1 \). We want to show that the estimate (A.1) holds if \( A^{\alpha\beta}_{ij}, F^\alpha_i \in C^{k-1}(B^+(0, R_0)) \). In this case \( v_\gamma \) solves the equation (A.2) with \( A^{\alpha\beta}_{ij}, F^\alpha_i \in C^{k-2}(B^+(0, R_0)) \), and we can use (A.1) for \( k-1 \). Thus

\[
\int_{B^+(0, R)} |D^{k-1}v_\sigma|^2 \, dx \leq c \sum_{\ell=2}^{k-2} \int_{B^+(0, R)} (R - q)^{-2(k-\ell)} |D(v_\sigma)|^2 \, dx
\]

\[
+ \int_{B^+(0, R)} |Dv_\sigma|^2 \, dx + \sum_{\ell=2}^{k-2} \int_{B^+(0, R)} |D^\ell F|^2 \, dx.
\]

Thus all derivatives of \( v \) of order \( k \) except \( D^k v \) are estimated. Finally, we obtain the estimate for \( D^k v \) on differentiating (A.3) \((k-2)\) times. \qed

**Lemma A.3.** Assume that \( \Omega \) is a domain of class \( C^k \), \( k \geq 2 \), \( x_0 \in \partial \Omega \) and \( 2R \leq R_0 \). Let \( v \in C^k(\Omega(x_0, 2R)) \) be a solution of

\[
D_\alpha (A^{\alpha\beta}_{ij}(x_0) D_\beta v^j) = 0, \quad i = 1, \ldots, m.
\]

Then for all \( \xi \in \mathbb{R}^m \) we have

\[
\int_{\Omega(x_0, R)} |D^k v|^2 \, dx \leq c \frac{R^{2(k-1)}}{R^{2(k-2)}} \int_{\Omega(x_0, 2R)} |Dv + \xi \otimes \nu(x_0)|^2 \, dx + cR^3 |\xi|^2
\]

\[
+ \frac{c}{R^{2(k-2)}} \int_{\Omega(x_0, 2R)} |Dv|^2 \, dx.
\]

**Proof.** Assume first that \( x_0 = 0 \) and \( \nu(x_0) = e_n \). By assumption there exists a diffeomorphism \( \gamma \in C^2(B^+(0, 2R)) \rightarrow \Omega(0, 2R) \) such that \( \gamma(B^+(0, R)) = \Omega(0, R) \) and \( D\gamma(0) = \text{Id} \). Let \( \tilde{v} = v \circ \gamma, \Gamma_{ij} = \partial \gamma^i / \partial x_j(x) \) and \((\Gamma^{ij}) = (\Gamma_{ij})^{-1} \). Then \( \tilde{v} \) is a solution of

\[
D_\mu (\tilde{A}^{\mu\nu}_{ij} D_\nu v^j) = 0, \quad i = 1, \ldots, m,
\]

with

\[
\tilde{A}^{\mu\nu}_{ij} = A^{\alpha\beta}_{ij} \Gamma^{\mu\beta} \Gamma^{\nu\alpha} \det D\gamma.
\]

Changing coordinates, we deduce that

\[
\int_{\Omega(x_0, R)} |D^k v| \, dx \leq c \sum_{\ell=1}^{k} \int_{B^+(0, R)} |D^\ell \tilde{v}|^2 \, dx
\]

\[
\leq \frac{c}{R^{2(k-1)}} \int_{B^+(0, 2R)} |D\tilde{v} - \xi \otimes e_n|^2 \, dx + cR^3 |\xi|^2 + \frac{c}{R^{2(k-2)}} \int_{B^+(0, 2R)} |D\tilde{v}|^2 \, dx.
\]

The last inequality follows for \( k = 2 \) directly from Lemma A.1: for \( k \geq 3 \) we apply Lemma A.2 iteratively to \( D^k \tilde{v}, \ell = k, k-1, \ldots, 3 \), on a sequence of half balls \( B^+(0, R_\ell) \) such that \((R_{\ell+1} - R_\ell)^{-1} \leq cR^{-1} \), and then use Lemma A.1 to estimate
the second derivatives. We now obtain the desired inequality in the case $x_0 = 0$, $v(x_0) = -e_n$, since

$$\int_{B^+(0,2R)} |\nabla \tilde{v} - \xi \otimes e_n|^2 \, dx \leq \int_{B^+(0,2R)} |\nabla v(\gamma(x))| |\gamma(x) - D\gamma(0)|^2 \, dx + \int_{B^+(0,2R)} |\nabla v(\gamma(x)) - \xi \otimes e_n|^2 \, dx$$

$$\leq cR^2 \int_{\Omega(0,2R)} |\nabla v|^2 \, dx + \int_{\Omega(0,2R)} |\nabla \tilde{v} - \xi \otimes e_n|^2 \, dx.$$ 

In the general case we choose a rigid motion $\xi(x) = R(x-x_0)$ with $R \in SO(n)$ such that $\Omega = \xi(\Omega)$ satisfies $\nu(\Omega) = -e_n$. Let $\tilde{v} = v(\xi^{-1}(x))$. Then

$$\int_{\Omega(0,2R)} |\nabla \tilde{v} - \xi \otimes e_n|^2 \, dx = \int_{\xi(\Omega(0,2R))} |\nabla v(\xi^{-1}(x))R^t - \xi \otimes R^t e_n R^t|^2 \, dx$$

$$= \int_{\Omega(x_0,2R)} |\nabla v + \xi \otimes v(x_0)|^2 \, dx.$$ 

The assertion of the lemma now follows as before.

**Corollary A.4.** Assume that $\Omega$ is a domain of class $C^k$, $k \geq 2$, $x_0 \in \partial \Omega$, and $2R \leq R_0$. Let $v \in W^{1,2}(\Omega(x_0,2R))$ be a solution of

$$D_\alpha (A_{ij}^\alpha (x_0)D_{\beta j} v) = 0, \quad i = 1, \ldots, m.$$ 

Then

$$\int_{\Omega(x_0,R)} |D^k v|^2 \, dx \leq \frac{c}{R^{2(k-1)}} \int_{\Omega(x_0,2R)} |\nabla v - (Dv(x_0)v)_{x_0,R} \otimes v(x_0)|^2 \, dx$$

$$+ \frac{c}{R^{2(k-2)}} \int_{\Omega(x_0,2R)} |\nabla v|^2 \, dx.$$ 

**Proof.** Standard regularity results in elliptic theory imply that $v$ is smooth in $\Omega(x_0,2R)$. The estimate follows now from Lemma A.3 with $\xi = -(Dv(x_0))_{x_0,R}$. 

**Proposition A.5.** Assume that $\Omega$ is a domain of class $C^{1,\sigma}$, $x_0 \in \partial \Omega$, and $v \in W^{1,2}(\partial \Omega, R)$ is a solution of the elliptic system

$$-D_\alpha (A_{ij}^\alpha (x_0)D_{\beta j} v) = 0$$ 

with $v = 0$ on $\partial \Omega \cap \partial \Omega(x_0, R)$. Then

$$\int_{\Omega(x_0,0)} |\nabla v - (Dv(x_0)v)_{x_0,0} \otimes v(x_0)|^2 \, dx \leq c \left( \frac{R}{\rho} \right)^{n+2} \int_{\Omega(x_0,R)} |\nabla v - (Dv(x_0)v)_{x_0,R} \otimes v(x_0)|^2 \, dx$$

$$+ cR^{2\sigma} \int_{\Omega(x_0,R)} |\nabla v|^2 \, dx.$$ 

**Proof.** This is an immediate consequence of the Campanato inequality in Proposition 3.3 for the solution $\tilde{v}$ of the transformed system on $B^+(0,R)$. See the proof of Lemma A.3 for details.
ACKNOWLEDGMENTS

Parts of these results are contained in my Ph.D. thesis, and it is my pleasure to thank my advisor J. Frehse for his constant support. I also thank the referee for many useful comments which helped to improve the manuscript.
