ANALYSIS OF A VARIABLE TIME-STEP DISCRETIZATION
OF THE THREE-DIMENSIONAL FRÉMOND MODEL
FOR SHAPE MEMORY ALLOYS

ULISSE STEFANELLI

ABSTRACT. This paper deals with a semi-implicit time discretization with variable step of a three-dimensional Frémond model for shape memory alloys. Global existence and uniqueness of a solution is discussed. Moreover, an a priori estimate for the discretization error is recovered. The latter depends solely on data, imposes no constraints between consecutive time steps, and shows an optimal order of convergence when referred to a simplified model.

1. Introduction

This paper is concerned with the following system of partial differential equations in terms of the unknown functions \( \vartheta, \chi_1, \chi_2, \) and \( u \):

\[
\begin{align*}
  &\partial_t \left( c_0 \vartheta - L \chi_1 \right) + \partial_t \left( (\alpha(\vartheta) - \vartheta \alpha'(\vartheta)) \chi_2 \text{div } u \right) - h \Delta \vartheta = F, \\
  &\text{div} \left( -\nu \Delta (\text{div } u) J + \lambda \text{div } u J + 2\mu \varepsilon(u) + \alpha(\vartheta) \chi_2 J \right) + G = 0, \\
  &k \partial_t \left( \chi_1 \chi_2 \right) + \left( \ell (\vartheta - \vartheta^*) \right) + \partial I_K \left( \chi_1, \chi_2 \right) \ni \begin{pmatrix} 0 \\ 0 \end{pmatrix},
\end{align*}
\]

a.e. in \( Q := \Omega \times (0, T) \), where \( \Omega \) is a bounded open subset of \( \mathbb{R}^3 \) with smooth boundary \( \partial \Omega \) and \( T > 0 \) stands for some final time. In addition, \( c_0, L, h, \lambda, \mu, k, \ell, \) and \( \vartheta^* \) are positive parameters, \( J \) is the identity matrix in \( \mathbb{R}^3 \), and \( \nu \) is a nonnegative constant. Here, \( \varepsilon \) denotes the tensor

\[
\varepsilon_{ij}(u) = \frac{1}{2} \left( \frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i} \right) \quad \text{for } i, j = 1, 2, 3,
\]

while \( \partial I_K \) stands for the subdifferential of the indicator function of a nonempty, bounded, convex and closed subset \( K \) of \( \mathbb{R}^2 \), and \( \alpha : \mathbb{R} \to \mathbb{R}, F : Q \to \mathbb{R}, G : Q \to \mathbb{R}^3 \) are given functions with some properties to be specified later.

The nonlinear system (1.1)-(1.3) is concerned with the behavior of shape memory alloys subject to thermo-mechanical treatments. These materials are metallic alloys which could be permanently deformed (avoiding fractures) and consequently be forced to recover the original shape just by thermal means.

Key words and phrases. Shape memory alloys, time discretization, existence and uniqueness, error estimate.

This work has been partially supported by the Istituto di Analisi Numerica del CNR, Pavia, Italy.
In the microscopic scale, this phenomenon is interpreted as the effect of a structural phase transition between different configurations of the metallic lattices, namely the *austenite* and its shared counterparts termed *martensites* (see, e.g., [1]). Various models have been proposed to describe this behavior from the macroscopic point of view (see [1]). If we assume the phases to coexist at each point of the shape memory sample and suppose that just two martensitic variants are present besides one austenite (in the three-dimensional space, up to 24 martensitic variants have been detected), indeed we may deal with the approach proposed by Frémond [7, 8, 11, 10]. In this context, \( \vartheta \) has to be regarded as the absolute temperature of the shape memory body while \( u \) accounts for its actual displacement and \( \varepsilon \) stands for the (linearized) strain tensor. Besides, \( \alpha(\vartheta) \) represents the thermal expansion of the system, and thus it vanishes at high temperatures (cf., e.g., [6, 10]). In our analysis \( \alpha \) is also required to fulfill some compatibility conditions complying with the physical setting (see [6, 10]). Regarding the phases, let \( \beta_1, \beta_2, \beta_3 \) be the volumetric proportions of the two martensitic variants and of the austenite, respectively. These quantities obviously fulfill the conditions

\[
\beta_1 + \beta_2 + \beta_3 = 1, \quad 0 \leq \beta_i \leq 1 \quad \text{for } i = 1, 2, 3. \tag{1.5}
\]

When we define the variables \( \chi_1 \) and \( \chi_2 \) as

\[
\chi_1 := \beta_1 + \beta_2, \quad \chi_2 := \beta_1 - \beta_2, \tag{1.6}
\]

relation (1.6) implies that

\[
[\chi_1, \chi_2] \in K := \{ [\gamma_1, \gamma_2] \in \mathbb{R}^2 \text{ such that } |\gamma_2| \leq \gamma_1 \leq 1 \}. \tag{1.6}
\]

From the constitutive laws coupled with the second principle of thermodynamics and the universal conservation laws for momentum and energy, one deduces the system (1.1)-(1.3). Note that equation (1.2) is considered in a *quasi-stationary* form, that is, the inertial term \( u_{tt} \) is omitted. Indeed, let us stress that the latter small deformations approximation of the momentum balance equation is a rather standard approach [3, 5, 6, 7, 8, 12, 19]. Moreover, note that the existence of a solution to the three-dimensional problem with full momentum and nonlinearities is still an open and extremely challenging question (the reader is referred to [4], where the full momentum equation is considered along with a linearized energy balance equation).

On the other hand, we stress that the energy balance equation of the full Frémond model [5] turns out to be

\[
\partial_t (c_0 \vartheta - L \chi_1) + \partial_t \left( (\alpha(\vartheta) - \vartheta \alpha'(\vartheta)) \chi_2 \text{ div } u \right) - h \Delta \vartheta = F + \alpha(\vartheta) \chi_2 \partial_t \text{ (div } u), \tag{1.7}
\]

while, in our framework, the nonlinearity in the right hand side of the previous equation is neglected. This simplification of the model has a technical motivation and seems mandatory in order to perform some error analysis. Indeed, from the analytical point of view, the choice of considering (1.1) instead of (1.7) is strictly connected with the crucial possibility of establishing an error estimate global in time, i.e., up to any reference time \( T \). As regards the physical viewpoint, it is well known that the quantity \( \| \alpha \|_{L^\infty(\mathbb{R})} \) turns out to be very small with respect to the other data whenever a real alloy is taken into account [6]. In this connection, a reasonable simplification of the model would be that of completely linearizing the energy balance equation (1.7). The latter was exactly the original approach to the
model proposed and investigated in the paper [6], and we may find in the literature some contributions dealing just with some of the nonlinearities of (1.7) (7,12). On the other hand, we shall remark that the model (1.1)-(1.3) is still suitable completely describing the effect of the phase transition on the energy balance equation, and that our simplification consists in neglecting part of the mechanically induced heat sources.

Finally, let us refer the reader to [6] for the physical meaning of the constants $c_0, L, h, \nu, \lambda, \mu, k, \ell$, and $\vartheta^*$. The system (1.1)-(1.3) has to be supplied with suitable initial and boundary conditions. We prescribe

$$\vartheta(\cdot,0) = \vartheta_0, \quad \chi_1(\cdot,0) = \chi_{1,0}, \quad \chi_2(\cdot,0) = \chi_{2,0}. \quad (1.8)$$

Denoting by $\partial_n$ the outward derivative to the boundary $\partial \Omega$ and letting $\{\Gamma_0, \Gamma_N\}$ be a partition of $\partial \Omega$ into measurable subsets with positive surface measures, we choose

$$h \partial_n \vartheta + \eta(\vartheta - f) = 0 \quad \text{on} \quad \partial \Omega \times (0,T), \quad (1.9)$$
$$\mathbf{u} = 0 \quad \text{on} \quad \Gamma_0 \times (0,T), \quad (1.10)$$
$$(-\nu \Delta(\text{div} \mathbf{u}) + \lambda \text{div} \mathbf{u} + \alpha(\vartheta) \chi_2) J + 2 \mu \varepsilon(\mathbf{u}) \mathbf{n} = \mathbf{g} \quad \text{on} \quad \Gamma_N \times (0,T), \quad (1.11)$$
$$\partial_n(\text{div} \mathbf{u}) = 0 \quad \text{on} \quad \partial \Omega \times (0,T). \quad (1.12)$$

Here $\eta$ denotes a positive parameter while $f : \partial \Omega \times (0,T) \to \mathbb{R}$, $\mathbf{g} : \Gamma_N \times (0,T) \to \mathbb{R}^3$ account for the interaction with the medium surrounding the domain.

Existence of solutions to various problems concerning systems close to (1.1)-(1.3) is well known (see [5] for a review). Nevertheless, to our knowledge, an existence result for (1.1)-(1.3) was not yet investigated. In this concern, this paper provides the global existence and the uniqueness of a solution. Note that the question of whether or not the full problem (thus keeping (1.7) instead of (1.1)) has a unique solution has already been positively solved in the paper [3].

On account of the present literature on this model, we notice that the existence of solutions to systems related to the Frémond model rely often on a suitable time-discretization – a priori estimates – passage to the limit procedure. In this direction, the main novelty of the present contribution is that of proving an optimal order a priori estimate of the discretization error of (a variable step version of) such an approximation. This estimate depends solely on data. In particular, the latter estimate is independent of the regularity of the continuous solution. Moreover, no constraints between consecutive time steps are imposed throughout the analysis of the approximation.

As regards the error analysis of the nonlinear inclusion (1.3) we shall remark that our technique is not new. Indeed, our argument relies on a careful application of the abstract analysis devised and fully detailed in [13,14].

Let us point out that a parallel investigation of the discretization error for the one-dimensional Frémond model for shape memory alloys is carried out in [19]. In the latter paper we prove an optimal order error estimate for the one-dimensional version of the full model (1.2)-(1.3), (1.7), thus retaining all the nonlinearities in the energy balance equation. We shall stress that the error analysis of the one-dimensional case is entirely different from the present one and relies deeply on the 1-D structure of the problem. In particular, we make a crucial use of the
possibility of rewriting an equivalent formulation of the problem which turns out to be completely independent of $u_x$.

This is the plan of the paper. In Section 2 we give a variational formulation of the continuous problem \((1.1)-(1.3), (1.8)-(1.12)\). Section 3 contains the approximation and the statement of our main results. The existence of a solution to the system \((1.1)-(1.3)\) is proved in Section 4, while Section 5 is devoted to deducing its uniqueness. Finally, Section 6 gives the proof of the error estimate.

## 2. Continuous problem

We start by fixing some notations. Let $(\cdot, \cdot)$ and $\|\cdot\|$ denote the scalar product and the norm in $L^2(\Omega)$, respectively, while $[\cdot, \cdot]$ stands for the general pair. We introduce the following Hilbert space:

$$V := \{v \in (H^1(\Omega))^3, \text{ such that } v = 0 \text{ on } \Gamma_0, \text{ div } v \in H^1(\Omega)\},$$

endowed with the norm

$$\|v\|_V := \left(\nu \int_{\Omega} |\nabla (\text{div } v)|^2 + \sum_{i=1}^3 \int_{\Omega} |\nabla v_i|^2\right)^{1/2}, \quad v = (v_1, v_2, v_3) \in V. \tag{2.1}$$

We also set, for any $u, v \in V$,

$$a(u, v) := \int_{\Omega} \left(\nu \nabla (\text{div } u) \cdot \nabla (\text{div } v) + \lambda \text{div } u \text{ div } v + 2\mu \sum_{i,j=1}^3 \varepsilon_{ij}(u)\varepsilon_{ij}(v)\right), \tag{2.2}$$

where $\varepsilon$ stands for the strain tensor specified in \((1.4)\). It is well known (see, e.g., [9, p. 110]) that there exists a positive constant $c_V$ depending on $\lambda, \mu$ and $\Omega$ such that

$$a(v, v) \geq c_V \|v\|_V^2 \quad \forall v \in V. \tag{2.3}$$

Moreover, it is not difficult to verify that

$$a(v, v) \geq \nu \|\nabla (\text{div } v)\|_{L^2(\Omega))^3}^2 + (\lambda + 2\mu/3) \|\text{div } v\|^2 \quad \forall v \in V. \tag{2.4}$$

Since the special triangular form of $K$ specified by relation \((1.4)\) is not needed for our analysis, let $K$ be an arbitrary nonempty, bounded, convex, and closed subset of $\mathbb{R}^2$, and define the (convex and closed) set

$$K := \{[\gamma_1, \gamma_2] \in (L^2(\Omega))^2, \text{ such that } [\gamma_1, \gamma_2] \in K \text{ a.e. in } \Omega\}. \tag{2.5}$$

It is now straightforward to fix a positive constant $c_K$ such that

$$\left(|\gamma_1(x)|^2 + |\gamma_2(x)|^2\right)^{1/2} \leq c_K \quad \forall [\gamma_1, \gamma_2] \in K, \text{ for a.e. } x \in \Omega. \tag{2.6}$$

We assume that the data fulfill

$$F \in L^2(Q), \tag{2.7}$$

$$f \in W^{1,1}(0, T; L^2(\partial \Omega)), \tag{2.8}$$

$$G \in H^1(0, T; (L^2(\Omega))^3), \tag{2.9}$$

$$g \in H^1(0, T; (L^2(\Gamma_N))^3), \tag{2.10}$$

$$\vartheta_0 \in H^1(\Omega), \quad [\chi_{1,0}, \chi_{2,0}] \in K, \tag{2.11}$$
and ask \( \alpha \) to be a smooth function, vanishing in the interval \( (\vartheta_c, +\infty) \), where \( \vartheta_c > 0 \) stands for the so-called Curie temperature. Moreover, we require that
\[
\alpha \in C^2(\mathbb{R}) \quad \text{and the set } \{ \xi \in \mathbb{R} : \alpha'(\xi) \neq 0 \} \quad \text{is contained in } [0, \vartheta_c], 
\]
and
\[
c_{\alpha} := \|\alpha''\|_{L^\infty(\mathbb{R})} \quad \text{is sufficiently small.}
\]
The previous condition will be made precise in the sequel (see (2.25)-(2.26)) and is satisfied by physically realistic data.

We stress that (2.12) ensures the validity of the inequalities
\[
|\alpha'(\xi)|, |\alpha''(\xi)| \leq \vartheta_c c_{\alpha}, \quad |\alpha(\xi)|, |\alpha'(\xi)| \leq \vartheta_c^2 c_{\alpha} \quad \forall \xi \in \mathbb{R},
\]
where \( c_{\alpha} \) is defined as above.

Remark 2.1. We note that some properties of \( \alpha \) such as monotonicity (in the sense that \( \alpha \) is a decreasing function) and positiveness, although physically motivated (see [8]), are not used in our analysis.

For the sake of convenience and owing to (2.3), (2.9)-(2.12) and to the Lax-Milgram lemma, we introduce the initial displacement \( u_0 \in V \) defined as the unique solution of the variational equality corresponding to the initial values, namely
\[
a(u_0, v) + (\alpha(\vartheta_0)\chi_{2,0}, \text{div} v) = \int_\Omega G(\cdot, 0) \cdot v \, dx + \int_{\Gamma_N} g(\cdot, 0) \cdot v \, d\Gamma \quad \forall v \in V.
\]

Thus, a precise formulation of problem (1.1)-(1.3), (1.8)-(1.12) is the following.

**Problem (P).** Find \( \vartheta \in H^1(0, T; L^2(\Omega)) \cap L^\infty(0, T; H^1(\Omega)), \quad u \in H^1(0, T; V), \quad \chi_1, \chi_2 \in H^1(0, T; L^2(\Omega)) \) such that
\[
\text{div} u \in C^0(\overline{Q}),
\]
and the following equations and conditions hold:
\[
\left( \partial_t (c_0 \vartheta - L\chi_1), \varphi \right) + \left( \partial_t \left( (\alpha(\vartheta) - \vartheta \alpha'(\vartheta))\chi_2 \text{div} u \right), \varphi \right) \\
+ h \int_{\Omega} \nabla \vartheta \cdot \nabla \varphi \, dx + \eta \int_{\partial\Omega} (\vartheta - f) \varphi \, d\Gamma = (F, \varphi) \quad \forall \varphi \in H^1(\Omega), \quad \text{a.e. in } (0, T),
\]
\[
a(u, v) + \left( \alpha(\vartheta)\chi_2, \text{div} v \right) = \int_{\Omega} G \cdot v \, dx + \int_{\Gamma_N} g \cdot v \, d\Gamma \quad \forall v \in V, \quad \text{a.e. in } (0, T),
\]
\[
k \sum_{j=1}^{2} \left( \partial_t \chi_j, \chi_j - \gamma_j \right) + \left( \ell(\vartheta - \vartheta^*), \chi_1 - \gamma_1 \right) \\
+ \left( \alpha(\vartheta) \text{div} u, \chi_2 - \gamma_2 \right) \leq 0 \quad \forall (\gamma_1, \gamma_2) \in K, \quad \text{a.e. in } (0, T),
\]
\[
\vartheta(\cdot, 0) = \vartheta_0 \quad \text{a.e. in } \Omega.
\]
\[
[\chi_1, \chi_2](\cdot, 0) = [\chi_{1,0}, \chi_{2,0}] \quad \text{a.e. in } \Omega.
\]
An early result for Problem \( (P) \) is the following (see \([5\), Lemma 1\]).

**Lemma 2.2.** For any \( \vartheta, \chi \in C^0([0,T]; L^2(\Omega)) \) satisfying
\[
|\chi_2(\cdot, t)| \leq c_K \quad \text{a.e. in } \Omega, \quad \forall t \in [0,T],
\]
there exists one and only one solution \( u \in C^0([0,T]; V) \) of \((2.19)\). Moreover \((2.16)\) holds, and there is a constant \( C_1 \), depending solely on \( c_V, \|\alpha\|_{L^\infty(\mathbb{R})}, c_K, \Omega, \|G\|_{C^0([0,T];(L^2(\Omega))^3)}, \|\tilde{g}\|_{C^0([0,T];(L^2(\Gamma_N))^3)} \), \( \nu, \lambda, \) and \( \mu \), such that
\[
\| \text{div} u(\cdot, t) \|_{L^\infty(\Omega)} \leq C_1 \quad \forall t \in [0,T].
\]

Then, our existence and uniqueness result reads as follows.

**Theorem 2.3.** Under assumptions \((2.7)-(2.12)\), and for \( \alpha \) fulfilling \((2.13)\) in the precise sense that \( C_2 := c_0 - \vartheta \alpha c_K c_1 > 0 \), \((2.25)\) holds, and there is a constant \( C_1 \), depending solely on \( c_V, \|\alpha\|_{L^\infty(\mathbb{R})}, c_K, \Omega, \|G\|_{C^0([0,T];(L^2(\Omega))^3)}, \|\tilde{g}\|_{C^0([0,T];(L^2(\Gamma_N))^3)} \), \( \nu, \lambda, \) and \( \mu \), such that
\[
\| \text{div} u(\cdot, t) \|_{L^\infty(\Omega)} \leq C_1 \quad \forall t \in [0,T].
\]

Then, our existence and uniqueness result reads as follows.

**Remark 2.4.** Note that, from \((1.1)\) it turns out that the quantity
\[
c_0 - \vartheta \alpha c_K c_1 \text{div } u
\]
(coefficient of \( \vartheta \) in \((1.1)\)) represents the actual specific heat of the shape memory body. In this sense, \((2.25)\) has to be regarded as a non degeneracy condition for the energy balance equation in \((1.1)\). In the same spirit, \((2.26)\) stands for a compatibility condition among the data.

The forthcoming Sections 4 and 5 are devoted to the proof of Theorem 2.3.

3. **Statement of the scheme and main results**

Now it is worth introducing our approximation of Problem \((P)\). To this aim, let \( \mathcal{P} \) be a partition of the time interval \([0,T]\), namely
\[
\mathcal{P} := \{0 = t^0 < t^1 < \cdots < t^{N-1} < t^N = T\},
\]
with variable step \( \tau^i := t^i - t^{i-1} \). No a priori constraints are imposed on the time steps, and \( \tau := \max_{1 \leq i \leq N} \tau^i \) denotes the diameter of the partition \( \mathcal{P} \). Let us set
\[
F^i := \frac{1}{\tau^i} \int_{t^{i-1}}^{t^i} F(\cdot, t) \, dt \in L^2(\Omega), \quad f^i := f(\cdot, t^i) \in L^2(\partial \Omega),
\]
for \( i = 1, \ldots, N \), and
\[
G^i := G(\cdot, t^i) \in (L^2(\Omega))^3, \quad g^i := g(\cdot, t^i) \in (L^2(\Gamma_N))^3,
\]
for \( i = 0, 1, \ldots, N \). Note that, by virtue of \((2.7)-(2.10)\), definitions \((3.2)-(3.3)\) make sense.

Moreover, we introduce two families of approximating initial data depending on \( \mathcal{P} \) and fulfilling
\[
\{ \vartheta_{0\mathcal{P}} \} \in H^1(\Omega), \quad \{[\chi_{1,0\mathcal{P}}, \chi_{2,0\mathcal{P}}] \} \in K.
\]
Now, let \( u_{0\mathcal{P}} \in V \) be the related initial displacement (cf. (2.15)), namely the solution of the variational equality
\[
(3.5) \quad a(u_{0\mathcal{P}}, v) + (\alpha(\theta_{0\mathcal{P}})\chi_{2,0\mathcal{P}}, \text{div} v) = \int_{\Omega} G^0 \cdot v \, dx + \int_{\Gamma_N} g^0 \cdot v \, d\Gamma \quad \forall v \in V.
\]

Then, the approximating problem can be stated as follows.

**Problem (P\( _\mathcal{P} \)).** Find the vectors \( \{\Theta^i\}_{i=0}^N \in (H^1(\Omega))^{N+1}, \{U^i\}_{i=0}^N \in V^{N+1}, \{X^i_j\}_{j=0}^{N} \in (L^2(\Omega))^{N+1}, \) for \( j = 1, 2, \) fulfilling
\[
(3.6) \quad \Theta^0 = \vartheta_{0\mathcal{P}}, \quad U^0 = u_{0\mathcal{P}}, \quad [X^0_1, X^0_2] = [\chi_{1,0\mathcal{P}}, \chi_{2,0\mathcal{P}}],
\]
and such that the following equations and conditions hold for \( i = 1, \ldots, N: \)
\[
(3.7) \quad [X^i_1, X^i_2] \in K,
\]
\[
(h_0 \Theta^i - \Theta^{i-1}) - L \frac{X^i_1 - X^{i-1}_1}{\tau_i} + h \int_{\Omega} \nabla \Theta^i \cdot \nabla \varphi \, dx + \eta \int_{\partial \Omega} (\Theta^i - f^i) \, \varphi \, d\Gamma + \left((\alpha(\Theta^i) - \Theta^i \alpha'(\Theta^i)) \frac{X^i_2 \text{div} U^i - (\alpha(\Theta^{i-1}) - \Theta^{i-1} \alpha'(\Theta^{i-1})) X^{i-1}_2 \text{div} U^{i-1}}{\tau_i}, \varphi \right) = (F^i, \varphi) \quad \forall \varphi \in H^1(\Omega),
\]
\[
(3.9) \quad a(U^i, v) + (\alpha(\Theta^i)X^i_2, \text{div} v) = \int_{\Omega} G^i \cdot v \, dx + \int_{\Gamma_N} g^i \cdot v \, d\Gamma \quad \forall v \in V,
\]
\[
\sum_{j=1}^2 \left( \frac{X^i_j - X^{i-1}_j}{\tau_i}, \frac{\Theta^i - \Theta^{i-1}}{\tau_i} \right) + \ell \left( (\Theta^i - \vartheta^i, X^i_1 - \eta_1) \right) + \left( \alpha(\Theta^i) \text{div} U^{i-1}, X^i_2 - \gamma_2 \right) \leq 0 \quad \forall \left[\gamma_1, \gamma_2\right] \in K.
\]

By virtue of (3.8), (3.9) and Lemma 2.2, it is straightforward to check that the following estimate holds:
\[
(3.11) \quad \| \text{div} U^i \|_{L^\infty(\Omega)} \leq C_1 \quad \text{for } i = 0, 1, \ldots, N,
\]
where \( C_1 \) is the same constant of relation (2.24).

Let us stress that the previous scheme is fully implicit in both the energy and the momentum equations. Regarding Problem (P\( _\mathcal{P} \)), we have

**Lemma 3.1.** Under assumptions (2.7)-(2.10), (2.12), (2.25)-(2.26), and (3.4), for any partition \( \mathcal{P} \), Problem (P\( _\mathcal{P} \)) has at least one solution.

**Proof.** Thanks to (3.4), it suffices to show that, given a quadruple \( (\Theta^{i-1}, X^{i-1}_1, X^{i-1}_2, U^{i-1}) \in H^1(\Omega) \times L^2(\Omega) \times L^2(\Omega) \times V \), the scheme (3.7)-(3.10) has a solution \( (\Theta^i, X^i_1, X^i_2, U^i) \in H^1(\Omega) \times L^2(\Omega) \times L^2(\Omega) \times V \), for any value of the time step \( \tau^i \). To this aim, we apply the Schauder fixed point theorem. As a first step, replace \( \Theta^i \) by \( \tilde{\Theta} \) in (3.10) and denote by \( [X_1, X_2] = [B_1(\tilde{\Theta}), B_2(\tilde{\Theta})] \) the solution to the resulting elementary variational inequality. Next, by replacing in (3.9) the terms \( \Theta^i \) and \( X^i_2 \) with \( \tilde{\Theta} \) and \( B_2(\tilde{\Theta}) \), respectively, one may find the unique solution \( \tilde{U} \in V \) to
the variational equality. Finally, denoting \( D(\hat{\Theta}, \hat{X}_2) := \text{div} \, \hat{U} \), it is straightforward to check that the estimate (2.24) holds for \( \text{div} \, \hat{U} \) as well. We deal with (8.8) by replacing \( x_i, x_j, \text{div} \, U \), and \( (\alpha(\Theta') - \Theta'\alpha'(\Theta')) \) by \( \hat{\Theta}_1, \hat{X}_2, \text{div} \, \hat{U} \), and \( (\alpha(\Theta) - \hat{\Theta}\alpha'(\hat{\Theta})) \), respectively. The existence of a unique solution \( \Theta =: E(\Theta, \hat{X}_1, \hat{X}_2, \text{div} \, \hat{U}) \) is then ensured by the Lax-Milgram lemma. Moreover, by testing (3.8) on \( \Theta \) with the help of (2.6), (2.12), (2.24), and the elementary inequality (which will be used in the sequel of the paper without any explicit recall) \( ab \leq (\delta a^2 + b^2)/2 \) for all \( a, b \in \mathbb{R}, \delta > 0 \), it is straightforward to choose a constant \( C_3 \) which depends on \( c_\alpha, c_K, \partial_c, C_1, \| f_i \|_{L^2(\partial \Omega)}, \eta, \| F \|_{L^2(\Omega)}, T, L, \) and \( C_2 \), such that the following estimate holds:

\[
\| \Theta \|^2 + \tau i \int_\Omega |\nabla \Theta|^2 \, dx + \tau i \int_{\partial \Omega} |\Theta|^2 \, d\Gamma \leq C_3.
\]

Thus, by defining

\[
S(\hat{\Theta}) := E(\hat{\Theta}, B_1(\hat{\Theta}), B_2(\hat{\Theta}), D(\hat{\Theta}, B_2(\hat{\Theta}))),
\]

it turns out that \( S \) maps \( L^2(\Omega) \) into a compact and convex subset, since the estimate (3.12) is independent of \( \hat{\Theta} \). In order to apply the Schauder fixed point theorem, it remains to show that \( S \) is continuous with respect to the topology of \( L^2(\Omega) \). Indeed, it suffices to prove the Lipschitz continuity of the operators \( B_1, B_2, D, \) and \( E \). Regarding \( B_1, B_2, \) and \( D \) this property has already been proved in [5]. Then, we choose two quadruples \((\hat{\Theta}, \hat{X}_1, \hat{X}_2, \text{div} \, \hat{U})\) and \((\overline{\Theta}, \overline{X}_1, \overline{X}_2, \text{div} \, \overline{U})\). By making use of (2.6) and (2.12), one may easily find a positive constant \( C_4 \), depending solely on \( L, \partial_c, c_\alpha, c_K, C_1, C_2 \), such that

\[
\| E(\hat{\Theta}, \hat{X}_1, \hat{X}_2, \text{div} \, \hat{U}) - E(\overline{\Theta}, \overline{X}_1, \overline{X}_2, \text{div} \, \overline{U}) \|^2 \\
\leq C_4 (\| \hat{\Theta} - \overline{\Theta} \|^2 + \| \hat{X}_1 - \overline{X}_1 \|^2 + \| \hat{X}_2 - \overline{X}_2 \|^2 + \| \text{div} \, \hat{U} - \text{div} \, \overline{U} \|^2).
\]

Finally, we conclude for a constant \( C_5 \) which depends only on data and fulfills

\[
\| S(\hat{\Theta}) - S(\overline{\Theta}) \|^2 \leq C_5 \| \hat{\Theta} - \overline{\Theta} \|^2
\]

for every \( \hat{\Theta}, \overline{\Theta} \in L^2(\Omega) \), whence \( S \) is continuous and the assertion is proved. \( \square \)

We stress that the forthcoming results of the paper do not rely at all on the uniqueness of a discrete solution. Indeed, both the convergence result and the error estimate hold for any discrete solution as well. Nevertheless, in view of numerical implementation, we prefer to devise here an uniqueness result for Problem \((P)\). Namely, by choosing a partition \( \mathcal{P} \) fine enough, we also achieve the following.

**Lemma 3.2.** Under assumptions (2.7)-(2.10), (2.12), (2.25)-(2.26), (3.4), and for any partition \( \mathcal{P} \) with diameter \( \tau \) small enough, the solution to Problem \((P)\) is unique.

**Proof.** We just sketch this argument, since it is very close to other proofs which will be detailed in the sequel of the paper. Let us reason by contradiction assuming that, given a quadruple \((\Theta^{i-1}, \alpha_{i-1}^{x_1}, \alpha_{i-1}^{x_2}, U^{i-1})\), two solutions to (3.7)-(3.10) (at level \( i \)) exist. We denote the latter two solutions by \((\hat{\Theta}, \hat{X}_1, \hat{X}_2, \hat{U})\) and \((\overline{\Theta}, \overline{X}_1, \overline{X}_2, \overline{U})\), and set

\[
\overline{\Theta} = \hat{\Theta} - \overline{\Theta}, \quad \overline{X}_1 = \hat{X}_1 - \overline{X}_1, \quad \overline{X}_2 = \hat{X}_2 - \overline{X}_2, \quad \overline{U} = \hat{U} - \overline{U}.
\]
Next, we write relations (3.8) and (3.9) for both the solutions, take the difference and test the resulting equations on $\varphi = \overline{\Theta}$ and $\mathbf{v} = \overline{\mathbf{U}},$ respectively. Owing to (2.3)-(2.4), (2.6), (2.12), and (2.24)-(2.25), one easily obtains

\[ C_2||\overline{\Theta}||^2 + \tau h \int_{\Omega} |\nabla \overline{\Theta}|^2 \, dx + \tau \eta \int_{\partial \Omega} ||\overline{\Theta}||^2 \, d\Gamma \]

(3.13)
\[ \leq 2\theta^2 \varepsilon C_1||\overline{\mathbf{X}}_2|| ||\overline{\Theta}|| + 2\theta^2 \varepsilon c\kappa || \mathbf{div} \overline{\mathbf{U}} || ||\overline{\Theta}||, \]

\[ \leq \frac{C_2}{2} ||\overline{\Theta}||^2 + \frac{(\lambda + 2\mu/3)}{2} || \mathbf{div} \overline{\mathbf{U}} ||^2 + \lambda \mu/2 || \nabla (\mathbf{div} \overline{\mathbf{U}}) ||_{L^2(\Omega)}^3 \]

(3.14)
\[ \leq \theta^2 \varepsilon c\kappa ||\overline{\mathbf{X}}_2|| ||\overline{\mathbf{U}}|| + \theta \varepsilon c\kappa ||\overline{\Theta}|| ||\overline{\mathbf{U}}||. \]

Since relation (2.26) ensures that
\[ \vartheta \varepsilon c\kappa (2\vartheta + 1) ||\overline{\Theta}|| ||\mathbf{div} \overline{\mathbf{U}}|| \leq \frac{3}{4} C_2 ||\overline{\Theta}||^2 + \frac{(\lambda + 2\mu/3)}{3} || \mathbf{div} \overline{\mathbf{U}} ||^2, \]

by taking the sum of inequalities (3.13)–(3.14) we easily infer that
\[ \frac{C_2}{4} ||\overline{\Theta}||^2 + \frac{C_2}{2} ||\overline{\mathbf{U}}||^2 + \frac{(\lambda + 2\mu/3)}{6} || \mathbf{div} \overline{\mathbf{U}} ||^2 \]

(3.15)
\[ \leq 2\theta^2 \varepsilon c\kappa C_1||\overline{\mathbf{X}}_2|| ||\overline{\Theta}|| + \theta^2 \varepsilon c\kappa ||\overline{\mathbf{X}}_2|| ||\overline{\mathbf{U}}|| \]
\[ \leq \frac{C_2}{8} ||\overline{\Theta}||^2 + \frac{(\lambda + 2\mu/3)}{12} || \mathbf{div} \overline{\mathbf{U}} ||^2 + C_6 ||\overline{\mathbf{X}}_2||^2, \]

where
\[ C_6 := \frac{8(\theta^2 \varepsilon c\kappa C_1)}{C_2} \frac{3(\theta^2 \varepsilon c\kappa)^2}{(\lambda + 2\mu/3)}. \]

As regards the variational inequality (3.10), arguing as above we infer that
\[ k \frac{\tau}{t^2} \sum_{j=1}^{2} ||\overline{\mathbf{X}}_j||^2 \leq \ell ||\overline{\Theta}|| ||\overline{\mathbf{X}}_1|| + \vartheta \varepsilon c\kappa C_1 ||\overline{\Theta}|| ||\overline{\mathbf{X}}_2||; \]

thus, it is straightforward to fix a positive constant, say $C_7,$ which depends on $k, \ell, \vartheta, c\kappa,$ and $C_1,$ and fulfills
\[ (3.16) \]
\[ \sum_{j=1}^{2} ||\overline{\mathbf{X}}_j||^2 \leq \tau^2 C_7 ||\overline{\Theta}||^2. \]

Finally, looking back to (3.15) and choosing
\[ \tau \leq \tau \leq C_2/(16 C_6 C_7), \]

we conclude that
\[ \frac{C_2}{16} ||\overline{\Theta}||^2 + \frac{C_2}{2} ||\overline{\mathbf{U}}||^2 \leq 0. \]

Hence, $\overline{\mathbf{U}} = 0,$ $\overline{\mathbf{U}} = \mathbf{0}$ and, recalling (3.16), $\overline{\mathbf{X}}_1 = \overline{\mathbf{X}}_2 = 0$ as well.

By virtue of Lemma (3.1) we may fix some convenient notations. Given $\{W^i\}_{i=0}^N$ in the linear space $\mathcal{W},$ set
\[ W^0(t) = W^0(t) := W^0 \quad \text{for } t \leq 0, \]
\[ W^i(t) := W^i, \quad W^i(t) := W^i + \frac{W^i - W^{i-1}}{\tau^i}(t - t^i) \quad \text{for } t \in [t^{i-1}, t^i], \quad i = 1, \ldots, N. \]
Moreover, we define an operator $T_P$ related to the partition $\mathcal{P}$. If $\phi : (0,T]$ is a piecewise constant function on $\mathcal{P}$, namely $\phi(t) = \phi^i$ for $t \in (t^{i-1},t^i]$, $i = 1,\ldots,N$, we set

$$(3.18) \quad (T_P \phi)(t) := \phi^{i-1} \quad \text{for} \quad t \in (t^{i-1},t^i], \ i = 1,\ldots,N.$$ 

Owing to (3.17) and (3.18) we may conveniently rewrite relations (3.8)-(3.10) as

$$\left( \partial_t \left( c_0 \Theta + \left( (\alpha(\Theta) - \Theta \alpha'(\Theta)) \nabla U \right) \right) , \varphi \right) + h \int_{\Omega} \nabla \Theta_p \cdot \nabla \varphi \, dx + \eta \int_{\partial \Omega} (\Theta_p - \overline{f}_P) \varphi \, d\Gamma = \left( \overline{f}_P + L \partial_t \chi_{1,P} , \varphi \right) \quad \forall \varphi \in H^1(\Omega), \ \text{a.e. in} \ (0,T),$$

$$(3.19) \quad a(\overline{f}_P,v) + \left( \alpha(\Theta_p) \chi_{2,P} , \text{div} \ v \right) = \int_{\Omega} \nabla \overline{f}_P \cdot v \, dx + \int_{\Gamma_N} \mathbf{g}_P \cdot v \, d\Gamma \quad \forall v \in \mathcal{V}, \ \text{a.e. in} \ (0,T),$$

and

$$\begin{align*}
(3.21) \quad & k \sum_{j=1}^{2} \left( \partial_j \chi_{j,P} , \overline{f}_P , \chi_{j,P} - \gamma_j \right) + \ell \left( \Theta_p - \partial^* \chi_{1,P} - \gamma_1 \right) \\
& + \left( \alpha(\Theta_p) T_P \text{div} \overline{f}_P , \chi_{2,P} - \gamma_2 \right) \leq 0 \quad \forall [\gamma_1, \gamma_2] \in K, \ \text{a.e. in} \ (0,T). 
\end{align*}$$

The derivation of our error estimates requires additional regularity for the function $F$. More precisely, we ask that

$$(3.22) \quad F \in BV([0,T]; L^2(\Omega)).$$

From assumptions (2.8)-(2.10), (3.22), and definitions (3.22) and (3.23) we deduce the existence of a positive constant $C_8$ such that

$$\begin{align*}
& \| F - \overline{f}_P \|_{L^1(0,T; L^2(\Omega))} + \| f - \overline{f}_P \|_{L^1(0,T; L^2(\partial \Omega))} \\
& \quad + \| G - \mathbf{g}_P \|_{L^2(0,T; (L^2(\Omega))^2)} + \| \mathbf{g} - \mathbf{g}_P \|_{L^2(0,T; (L^2(\Gamma_N))^2)} \leq C_8 \tau, 
\end{align*}$$

as easy calculations provide. Besides, we choose initial values such that

$$(3.24) \quad \| \partial_0 - \partial_{0P} \| + \sum_{j=1}^{2} \| \chi_{j,0} - \chi_{j,0P} \| \leq C_9 \tau,$$

for some positive constant $C_9$. Moreover, as a consequence of (3.24), taking the difference between (2.15) and (3.5) and choosing $v = u_0 - u_{0P}$, relations (2.3)-(2.4), (2.6), (2.24), and (2.14) ensure us that

$$\begin{align*}
(3.25) \quad & \| u_0 - u_{0P} \|_V + \| \text{div} \ u_0 - \text{div} \ u_{0P} \| \leq C_{10} \tau, 
\end{align*}$$

for a proper constant $C_{10}$, depending on $\partial_c, c_0, C_1, C_9, \lambda, \mu, \text{and} \ cv$.

Now, we state our error estimate.

**Theorem 3.3.** Under assumptions (2.8)-(2.10), (3.22) and (3.23), let $(\partial_P, u, \chi_1, \chi_2), \{ \Theta_0, U^i, \chi_0, \chi_i \}_{i=0}^{N}$ be solutions to Problem (P) and Problem $(P_P)$, respectively, and let $\Theta_P, \overline{\Theta}_P, \chi_{1,P}, \chi_{2,P}, \overline{U}_P$, be as in (3.17). Then, there
exists a positive constant $C_{11}$, depending only on the data, such that, for every partition $\mathcal{P}$, the following estimate holds:
\begin{equation}
\| \theta - \Theta_{\mathcal{P}} \|_{L^2(0,T;L^2(\Omega))} + \sup_{t \in [0,T]} \left\| \int_0^t (\theta - \Theta_{\mathcal{P}})(s) \, ds \right\|_{H^1(\Omega)} 
+ \| u - U_{\mathcal{P}} \|_{L^2(0,T;L^2(\Omega))} + \sum_{j=1}^2 \| \chi_j - \chi_{j,\mathcal{P}} \|_{C^0([0,T];L^2(\Omega))} \leq C_{11} \tau.
\end{equation}

Remark 3.4. We point out that the a priori estimate (3.26) is optimal with respect to the order of convergence, since the backward Euler method is used to approximate Problem (P). Moreover, our estimate is optimal with respect to the regularity of the phase variables $\chi_1, \chi_2$ in the sense of [14]. Since no a priori constraints between consecutive time steps are imposed in our analysis, (3.26) ensures the possibility of implementing a step-by-step choice of time step sizes as shown in [14]. However, let us point out that $C_{11}$ depends exponentially on $T$, as Gronwall's lemma is used in the proof of (3.26).

Remark 3.5. Let us stress that the same error estimate still holds if we replace the terms $\| \theta - \Theta_{\mathcal{P}} \|_{L^2(0,T;L^2(\Omega))}$ and $\| u - U_{\mathcal{P}} \|_{L^2(0,T;L^2(\Omega))}$ with $\| \theta - \Theta_{\mathcal{P}} \|_{L^2(0,T;L^2(\Omega))}$ and $\| u - U_{\mathcal{P}} \|_{L^2(0,T;L^2(\Omega))}$, respectively (see the following Lemma 4.1).

4. Existence

In this section we prove the existence result of Theorem 2.3. This proof follows closely the argument devised in [5], so it will be just sketched, referring to that paper for the details.

First of all, we establish some estimates for the approximating solutions which are independent of $\mathcal{P}$. More precisely, one finds two constants $\tau^*$ and $C_{12}$, which depend on $\| \alpha \|_{L^\infty(\mathbb{R})}$, $\Omega$, $\Gamma_N$, $\Gamma_D$, $L$, $\theta_c$, $c_0$, $C_1$, $C_2$, and $T$, such that, for every partition $\mathcal{P}$ with diameter $\tau < \tau^*$, one has (see [6] Lemma 3.1 and eq. (4.27))
\begin{equation}
\| \Theta_{\mathcal{P}} \|_{H^1(0,T;L^2(\Omega))} + \| \Theta_{\mathcal{P}} \|_{L^\infty(0,T;H^1(\Omega))} + \| U_{\mathcal{P}} \|_{H^1(0,T;L^2(\Omega))} + \| \text{div } U_{\mathcal{P}} \|_{L^\infty(\Omega)}
+ \| \text{div } U_{\mathcal{P}} \|_{H^1(0,T;L^2(\Omega))} + \sum_{j=1}^2 \| \chi_j,\mathcal{P} \|_{H^1(0,T;L^2(\Omega))} \cap L^\infty(\Omega) \leq C_{12}.
\end{equation}

Indeed, relations (2.12) and (4.1) also ensure that
\begin{equation}
\| (\alpha(\Theta_{\mathcal{P}}) - \Theta_{\alpha'}(\Theta_{\mathcal{P}})) \|_{W^{1,\infty}(\Omega)} \quad \text{is bounded independently of } \mathcal{P}.
\end{equation}

For the sake of convenience, we collect here some convergence results which will be useful in the sequel.

Lemma 4.1. Let $\Theta_{\mathcal{P}}, \Theta_{\mathcal{P}}, U_{\mathcal{P}}, \bar{U}_{\mathcal{P}}, \chi_{j,\mathcal{P}}, \bar{\chi}_{j,\mathcal{P}}$ for $j = 1,2$ be defined as in (3.17) and fulfill (4.1). Moreover, let $\mathcal{T}_{\mathcal{P}}$ be defined in (3.18). Then we have
\begin{align}
\| \Theta_{\mathcal{P}} - \Theta_{\mathcal{P}} \|_{L^2(\Omega)} &\leq C\tau, \\
\| \Theta_{\mathcal{P}} - \Theta_{\mathcal{P}} \|_{L^\infty(0,T;L^2(\Omega))} &\leq C\sqrt{\tau}, \\
\| U_{\mathcal{P}} - \bar{U}_{\mathcal{P}} \|_{L^2(0,T;L^2(\Omega))} &\leq C\tau, \\
\| U_{\mathcal{P}} - \bar{U}_{\mathcal{P}} \|_{L^\infty(0,T;L^2(\Omega))} &\leq C\sqrt{\tau}, \\
\| \chi_{j,\mathcal{P}} - \bar{\chi}_{j,\mathcal{P}} \|_{L^2(\Omega)} &\leq C\tau \quad \text{for } j = 1,2.
\end{align}
where \( \alpha, \tau \).

Let Lemma 4.2. Then, we prove the following useful lemma above since the passage to the limit in the other two terms is ensured by the above easy calculations yield

\[
\| \text{div } \mathbf{U}_\mathbf{T} - T\text{div } \mathbf{U}_\mathbf{T} \|_{L^2(0,T;H^1(\Omega))}^2 \leq \sum_{i=1}^{N} \frac{\tau_i}{3} \| \text{div } U^i - \text{div } U^{i-1} \|_{H^1(\Omega)}^2 \leq C\tau^2.
\]

By taking the limit in equations (3.19)-(3.21) as the diameter of partitions tends to 0, one shows that Problem (P) has at least one solution. Indeed, the estimates (4.11)-(4.12) and well-known compactness results (see, for instance, [13 Cor. 4]) ensure that there exist \( \vartheta, u, \) and \( \psi \) such that, possibly taking subsequences (not relabeled),

\[
\Theta_{\mathbf{T}} \rightharpoonup^{\ast} \vartheta \quad \text{weakly star in } H^1(0,T;L^2(\Omega)) \quad \text{and}
\]

\[
\mathbf{U}_{\mathbf{T}} \rightharpoonup \mathbf{u} \quad \text{weakly in } H^1(0,T;\mathbf{V}),
\]

\[
\text{div } \mathbf{U}_{\mathbf{T}} \rightharpoonup \text{div } \mathbf{u} \quad \text{strongly in } C^0([0,T];L^2(\Omega)),
\]

\[
(\alpha(\Theta) - \Theta\alpha'(\Theta))_{\mathbf{T}} \rightharpoonup \psi \quad \text{weakly star in } W^{1,\infty}(\Omega),
\]
as the diameter \( \tau \) tends to 0 (clearly much more is true). Moreover, the previous convergences, along with Lemma 4.1, entail that 7 Sect. 5

\[
(\alpha(\Theta) - \Theta\alpha'(\Theta)) \rightarrow \alpha(\vartheta) - \vartheta\alpha'(\vartheta) \quad \text{strongly in } C^0([0,T];L^2(\Omega)).
\]

It remains to prove that \( \vartheta, \chi_1, \chi_2, \) and \( \text{div } u \) fulfill (2.13). To this aim, note that easy calculations yield

\[
\partial_t \left( (\alpha(\Theta) - \Theta\alpha'(\Theta))\chi_2 \text{div } \mathbf{U} \right)_{\mathbf{T}} = \partial_t (\alpha(\Theta) - \Theta\alpha'(\Theta))_{\mathbf{T}} \chi_2 \text{div } \mathbf{U}_{\mathbf{T}}
\]

\[
+ T\mathbf{p} (\alpha(\Theta_{\mathbf{T}}) - \Theta\alpha'(\Theta_{\mathbf{T}})) \partial_t \chi_2 \text{div } \mathbf{U}_{\mathbf{T}}
\]

\[
+ T\mathbf{p} (\alpha(\Theta_{\mathbf{T}}) - \Theta\alpha'(\Theta_{\mathbf{T}})) \chi_2 \text{div } \mathbf{U}_{\mathbf{T}}.
\]

Referring to [5], we only have to deal with the first term in the right hand side above since the passage to the limit in the other two terms is ensured by the above listed convergences. In particular, let us prove the following useful lemma

**Lemma 4.2.** Let \( E \) and \( F \) be normed linear spaces. Moreover, let \( g : E \to F \) be a Lipschitz continuous function of Lipschitz constant \( L_g \), \( \{u^i\}_{i=0}^{N} \in E^{N+1} \), and let \( \left( g(u) \right)_{\mathbf{T}} \) and \( u_{\mathbf{T}} \) be defined as in (3.17). Then,

\[
\left\| (g(u))_{\mathbf{T}} - g(u_{\mathbf{T}}) \right\|_{L^2(0,T;F)} \leq \sqrt{2/15} L_g \tau \| \partial_t u_{\mathbf{T}} \|_{L^2(0,T;E)}.
\]
Proof. Fix $t \in (t_i^{-1}, t_i^+]$ for $i = 1, \ldots, N$, and let $\alpha_i(t) = (t - t_i^{-1})/\tau_i$; we have
\[
\| (g(u))_{\mathcal{P}}(t) - g(u_{\mathcal{P}}(t)) \|_F
= \| \alpha_i(t) g(u^i) + (1 - \alpha_i(t)) g(u^{i-1}) - g(\alpha_i(t) u^i + (1 - \alpha_i(t)) u^{i-1}) \|_F
= \| \alpha_i(t) g(u^i) + (1 - \alpha_i(t)) g(\alpha_i(t) u^i + (1 - \alpha_i(t)) u^{i-1}) - (1 - \alpha_i(t)) g(\alpha_i(t) u^i + (1 - \alpha_i(t)) u^{i-1}) \|_F
\leq 2 L g \| \alpha_i(t)(1 - \alpha_i(t)) \| u^i - u^{i-1} \|_E,
\]
since we have that both $\alpha_i(t)$ and $(1 - \alpha_i(t))$ are nonnegative. Owing to the previous inequality and easy calculations, we have
\[
\| (g(u))_{\mathcal{P}} - g(u_{\mathcal{P}}) \|_{L^2(0,T;F)}^2 = \int_0^T \| (g(u))_{\mathcal{P}}(t) - g(u_{\mathcal{P}}(t)) \|_F^2 \, dt
\leq 4 L g^2 \sum_{i=1}^N \left( \left( \int_{t_{i-1}}^{t_i} \alpha_i^2(t) (1 - \alpha_i(t))^2 \, dt \right) \| u^i - u^{i-1} \|_E^2 \right)
\leq \frac{2}{15} L g^2 \sum_{i=1}^N \tau \| u^i - u^{i-1} \|_E^2 = \frac{2}{15} L g^2 \tau^2 \| \partial_t u_{\mathcal{P}} \|_{L^2(0,T;E)}^2,
\]
whence the assertion follows.

An application of the previous result (along with (2.12) and (4.11)) ensures that
\[
(\alpha(\Theta) - \Theta \alpha'(\Theta))_{\mathcal{P}} - (\alpha(\Theta_{\mathcal{P}}) - \Theta_{\mathcal{P}} \alpha'(\Theta_{\mathcal{P}})) \rightarrow 0 \quad \text{strongly in } L^2(Q),
\]
so that, owing to (2.12), (4.10), (4.13), and (4.15), we have that $\psi = \alpha(\vartheta) - \vartheta \alpha'(\vartheta)$, whence, recalling (4.13), one in particular infers that
\[
\partial_t (\alpha(\Theta) - \Theta \alpha'(\Theta))_{\mathcal{P}} \rightarrow \partial_t (\alpha(\vartheta) - \vartheta \alpha'(\vartheta)) \quad \text{weakly in } L^2(Q).
\]
Then, owing to the latter convergence and arguing as in [5], one easily checks that relation (5.18) is fulfilled, and the proof is complete.

5. Uniqueness

The following proof follows closely the argument set forth in [3]. Therefore, we just suggest how to proceed, and omit most of the computations. We reason by contradiction. Let $(\vartheta^1, \chi^1, \lambda^1, \mathbf{u}^1)$ and $(\vartheta^2, \chi^2, \lambda^2, \mathbf{u}^2)$ be two solutions to Problem (P) and set $\overline{\mathbf{u}} := \vartheta^1 - \vartheta^2$, $\overline{\chi} := \chi^1 - \chi^2$, $\overline{\lambda} := \lambda^1 - \lambda^2$, $\overline{\mathbf{u}} := \mathbf{u}^1 - \mathbf{u}^2$. Let us take the difference between equation (2.18) written for $(\vartheta^1, \chi^1, \lambda^1, \mathbf{u}^1)$ and the same equation for $(\vartheta^2, \chi^2, \lambda^2, \mathbf{u}^2)$, integrate the resulting relation on $(0,t)$, choose $\varphi = \overline{\mathbf{u}}(t)$, and integrate once more over $(0,t)$. Owing to relations (2.19), (2.21), (2.14), (2.24), the Hölder inequality, and the mean value theorem, one infers that
\[
\frac{11}{12} C_2 \| \overline{\mathbf{u}} \|_{L^2(0,T;L^2(\Omega))}^2 + \frac{h}{2} \left\| \nabla \left( \int_0^t \nabla(\overline{\mathbf{u}}) ds \right) \right\|_{L^2(\partial\Omega)}^2 + \frac{\eta}{2} \left\| \int_0^t \nabla(\overline{\mathbf{u}}) ds \right\|_{L^2(\partial\Omega)}^2
\leq 2 \vartheta^2 c_{\mathcal{P}} \int_0^t \| \text{div} \overline{\mathbf{u}}(s) \| \| \overline{\mathbf{u}}(s) \| ds + C_{13} \int_0^t \sum_{j=1}^2 \| \overline{\chi}(s) \|^2 ds,
\]
where the constant $C_{13}$ depends on $\vartheta_{c}$, $c_{\mathcal{P}}$, $L$, $C_1$, and $C_2$. Next, we write relation (2.20) for $(\vartheta^1, \chi^1, \lambda^1, \mathbf{u}^1)$ (letting $[\gamma_1, \gamma_2] = [\lambda^1(t), \lambda^2(t)]$) and $(\vartheta^2, \chi^2, \lambda^2, \mathbf{u}^2)$...
(letting $[\gamma_1, \gamma_2] = [\chi^1(t), \chi^2(t)]$, respectively). Taking the sum of the two inequalities, integrating in time, and owing to relations (2.24) and (2.14), one easily finds a proper constant $C_{14}$, depending on $\vartheta_c, c_\alpha, \lambda, \mu, \ell, C_1$, and $C_2$, such that

$$k/2 \sum_{j=1}^2 \|\nabla \chi_j(t)\|^2 \leq \frac{C_2}{12} \|
abla \varphi\|^2_{L^2(0,t;L^2(\Omega))}$$

(5.2)

$$+ \frac{(\lambda + 2\mu/3)}{24} \|\text{div} u\|^2_{L^2(0,t;L^2(\Omega))} + C_{14} \int_0^t \sum_{j=1}^2 \|\nabla \chi_j(s)\|^2 ds.$$  

Finally, we write (2.19) for both $(\vartheta^1, \chi^1, \chi^2, u^1)$ and $(\vartheta^2, \chi^2, \chi^2, u^2)$, take the difference between the two resulting equalities, choose $v = \nabla \varphi$, and integrate in time. Owing to (2.3)-(2.4), (2.17), and (2.14), one has

$$C_{15} \leq \nabla c_\alpha c c \int_0^t \|\nabla \varphi\|^2 \|\text{div} u\| ds + C_{15} \int_0^t \|\nabla \chi_2(s)\|^2 ds,$$

where $C_{15}$ properly depends on $\vartheta_c, c_\alpha, \lambda, \mu$. Now, we take the sum between (5.1), (5.2), and (5.3). Since (2.26) ensures that

$$\left(\vartheta_c(2\vartheta_c + 1)c_\alpha c c\right) \int_0^t \|\nabla \varphi\|^2 \|\text{div} u\| ds$$

$$\leq \frac{3}{4} C_2 \|\nabla \varphi\|^2_{L^2(0,t;L^2(\Omega))} + \frac{(\lambda + 2\mu/3)}{3} \|\text{div} u\|^2_{L^2(0,t;L^2(\Omega))},$$

one infers, for all $t \in (0, T)$, that

$$\frac{C_2}{12} \|
abla \varphi\|^2_{L^2(0,t;L^2(\Omega))} + \int_0^t \|\nabla \varphi\|^2_{L^2(\Omega)} + \frac{h}{2} \left\|\left(\int_0^t \|\nabla \varphi\| ds\right)\right\|_{L^2(\Omega)}^2 + \frac{\eta}{2} \left\|\int_0^t \|\nabla \varphi\| ds\right\|_{L^2(\Omega)}^2$$

(5.4)

$$+ \frac{\lambda + 2\mu/3}{12} \|\text{div} u\|^2_{L^2(0,t;L^2(\Omega))} + \frac{k}{2} \sum_{j=1}^2 \|\nabla \chi_j(t)\|^2$$

$$\leq C_{16} \int_0^t \sum_{j=1}^2 \|\nabla \chi_j(s)\|^2 ds,$$

where $C_{16} := 3 \max\{C_{13}, C_{14}, C_{15}\}$. Hence, applying Gronwall’s lemma (see, e.g., the version reported in [2] Thm. 1), we conclude that the solution to Problem (P) is unique.

6. Error estimates

Henceforth, $C$ stands for a positive constant depending eventually on data but independent of $\mathcal{P}$. Of course, $C$ may vary from line to line. Moreover, in the rest of this paper, where no confusion arises, we will drop the subscript $\mathcal{P}$ from the functions $\Theta_\mathcal{P}, \Theta_\mathcal{P}, X_1, X_2, X_1, \chi_1, \chi_2, \chi_3, \chi_4, U_\mathcal{P}, U_\mathcal{P}, F_\mathcal{P}, U_\mathcal{P}, G_\mathcal{P}, \text{ and } \bar{G}_\mathcal{P}$.

Let us start by handling the variational inequalities (2.20) and (3.21). To this end, we refer the reader to [13], [14], where this analysis is developed in an abstract setting, and to [17], [18], where it has been applied. We choose
\[ [\gamma_1, \gamma_2] = [\overline{X}_1(t), \overline{X}_2(t)] \text{ in } (2.20), \quad [\gamma_1, \gamma_2] = [\chi_1(t), \chi_2(t)] \text{ in } (6.24) \] and sum the corresponding two inequalities. By easy calculations one infers that
\[
k \sum_{j=1}^{2} \left( \partial_t (\chi_j - \overline{X}_j), (\chi_j - \overline{X}_j) \right) + k \sum_{j=1}^{2} \left( \partial_t \overline{X}_j, (\overline{X}_j - \chi_j) \right) + \ell \left( \theta - \overline{\sigma}, \chi_1 - \overline{X}_1 \right) + \left( \alpha(\theta) \text{ div } \mathbf{u} - \alpha(\overline{\sigma}) \text{ div } \overline{\mathbf{u}}, \chi_2 - \overline{X}_2 \right) \leq 0.
\]
Taking the integral over \((0, t)\), we have
\[
k \sum_{j=1}^{2} \frac{\alpha}{2} \left\| (\chi_j - \overline{X}_j)(t) \right\|^2 = \sum_{i=1}^{5} I_i(t),
\]
for all \( t \in (0, T) \), where
\[
I_1 = \frac{k}{2} \sum_{j=1}^{2} \left\| \chi_{j,0} - \chi_{j,0} \right\|^2,
\]
\[
I_2(t) = k \int_{0}^{t} \sum_{j=1}^{2} \left\langle \partial_t \overline{X}_j(s), (\chi_j - \overline{X}_j)(s) \right\rangle ds,
\]
\[
I_3(t) = -\ell \int_{0}^{t} \left( \theta - \overline{\sigma}, \chi_1 - \overline{X}_1 \right)(s) ds,
\]
\[
I_4(t) = -\int_{0}^{t} \left( (\alpha(\theta) \text{ div } \mathbf{u} - \alpha(\overline{\sigma}) \text{ div } \overline{\mathbf{u}})(s), (\chi_2 - \overline{X}_2)(s) \right) ds,
\]
\[
I_5(t) = -\int_{0}^{t} \left( \alpha(\overline{\sigma})(\text{ div } \overline{\mathbf{u}} - \mathbb{T}_p \text{ div } \overline{\mathbf{u}})(s), (\chi_2 - \overline{X}_2)(s) \right) ds.
\]
Clearly, \((6.24)\) ensures that
\[
I_1 \leq C \tau^2.
\]

Our next aim is to control the residual quantity \(I_2(t)\). Let \( t \in (t_i-1, t_i] \), for some \( i = 1, \ldots, N \). We have that
\[
\sum_{j=1}^{2} \left( \partial_t \chi_j, (\chi_j - \overline{X}_j)(t) \left\| \frac{\chi_i - \chi_i^{i-1}}{\tau^i}, \alpha_i(t) \chi_j^i + (1 - \alpha_i(t)) \chi_j^{i-1} - \chi_j^i \right\|^2
\]
\[
= (\alpha_i(t) - 1) \tau^i \sum_{j=1}^{2} \left\| \frac{\chi_i - \chi_i^{i-1}}{\tau^i} \right\|^2,
\]
where, once again, \( \alpha_i(t) = (t - t_i-1) / \tau^i \) (note that \( |\alpha_i| \leq 1 \)). Then, one infers that
\[
\sum_{j=1}^{2} \left( \partial_t \chi_j, (\chi_j - \overline{X}_j)(t) \right) \leq 0 \quad \forall t \in (0, T),
\]
and, consequently,
\[
I_2(t) \leq 0 \quad \forall t \in (0, T).
\]
Regarding $I_3(t)$ and $I_4(t)$, by virtue of (2.14), (4.3), and (4.8), one infers that

\[
(6.4) \quad I_3(t) \leq \frac{C_2}{52} \|\vartheta - \Theta\|_{L^2(0,t;L^2(\Omega))}^2 + C \left( \int_0^t \|\chi_1 - \chi_1(s)\|^2 ds + \tau^2 \right),
\]

\[
I_4(t) \leq \int_0^t \left( \left( \alpha(\vartheta)(\text{div} \ u - \text{div} \ U), \chi_2 - \chi_2' \right) \right) (s) ds
+ \int_0^t \left( \left( \text{div} \ U(\alpha(\vartheta) - \alpha(\Theta)), \chi_2 - \chi_2' \right) \right) (s) ds
\leq \frac{(\lambda + 2\mu/3)}{24} \|\text{div} \ u - \text{div} \ U\|_{L^2(0,t;L^2(\Omega))}^2 + \frac{C_2}{52} \|\vartheta - \Theta\|_{L^2(0,t;L^2(\Omega))}^2
\]

\[
+ C \left( \int_0^t \|\chi_2 - \chi_2\|_{L^2(\Omega)}^2 ds + \tau^2 \right).
\]

Please note that the constant $C_2$ in the calculations above is exactly the one appearing in (2.25). Moreover, let us stress that the choice of the quantity $C_2/52$ and $(\lambda + 2\mu/3)/24$, although it is not straightforward at the moment, is strictly related with assumptions (2.25) and (2.4), respectively, as will be clear in the sequel.

Due to relations (2.14) and (4.7)-(4.8), it is possible to control $I_5(t)$ as follows:

\[
I_5(t) \leq \frac{(\vartheta^2 c_0)^2}{2} \|\text{div} \ U - T_\vartheta \text{div} \ U\|_{L^2(0,t;L^2(\Omega))}^2 + \frac{1}{2} \int_0^t \|\chi_2 - \chi_2\|_{L^2(\Omega)}^2 ds
\]

\[
\leq C \left( \int_0^t \|\chi_2 - \chi_2\|_{L^2(\Omega)}^2 ds + \tau^2 \right).
\]

In order to get a control of the function $\vartheta - \Theta_\vartheta$ with respect to the norm of $L^2(0,T;L^2(\Omega))$ we consider the integral of (2.18) and (3.19) over $(0,t)$ for $t \in (0,T)$, and obtain, respectively,

\[
(6.7) \quad c_0 \left( \left( \vartheta(t) - \vartheta_0, \varphi \right) + h \int_\Omega \nabla \left( \int_0^t \vartheta(s) ds \right) \cdot \nabla \varphi dx
+ \eta \int_{\partial \Omega} \left( \int_0^t (\vartheta - f)(s) ds \right) \varphi d\Gamma
= \int_0^t \left( F(s), \varphi \right) ds + L \left( \chi_1(t) - \chi_{1,0}, \varphi \right)
+ \left( \left( \vartheta_0 \alpha'(\vartheta) - \alpha(\vartheta) \right) \chi_2 \text{div} \ u(t), \varphi \right) - \left( \vartheta_0 \alpha'(\vartheta_0) - \alpha(\vartheta_0) \right) \chi_{2,0} \text{div} \ u_0, \varphi \right) \right),
\forall \varphi \in H^1(\Omega),
\]

License or copyright restrictions may apply to redistribution; see https://www.ams.org/journal-terms-of-use
Taking the difference between (6.7) and (6.8), choosing \( \varphi \) and integrating \( (0, t) \) for all \( t \), where

\[
\begin{align*}
    \eta \int_{\partial \Omega} \left( \int_0^t (\varphi - \bar{\varphi})(s) \, ds \right) \, d\Gamma &= \int_0^t (F(s), \varphi) \, ds \\
    + L \left( (\chi_1(t) - \chi_{1,0\mathcal{P}}), \varphi \right) + \left( (\Theta \alpha'(\Theta) - \alpha(\Theta)) \chi_2 \, \text{div} \, \mathbf{U}(t), \varphi \right) \\
    - \left( \partial_0 \alpha'(\theta_0) - \alpha(\theta_0) \right) \chi_{2,0\mathcal{P}} \, \text{div} \, \mathbf{u}_0, \varphi \right) + \left( R(t), \varphi \right),
\end{align*}
\]

(6.8)

where the residual term \( R(t) \) is defined by

\[
R(t) := \int_0^t \left( (\Theta \alpha'(\Theta) - \alpha(\Theta)) \chi_2 \, \text{div} \, \mathbf{U} \right)_P \\
- (\Theta \alpha'(\theta_0) - \alpha(\theta_0)) \chi_{2,0\mathcal{P}} \, \text{div} \, \mathbf{u}_0, \varphi \right).
\]

Taking the difference between (6.7) and (6.8), choosing \( \varphi = (\vartheta - \bar{\varphi})(t) \) and integrating over \( (0, t) \), one infers that

\[
c_0 \| \vartheta - \Theta \|_{L^2(0,t;L^2(\Omega))^3}^2 + \frac{h}{2} \left\| \nabla \left( \int_0^t (\vartheta - \bar{\vartheta})(s) \, ds \right) \right\|_{(L^2(\Omega))^3}^2 \\
+ \eta \left\| \int_0^t (\vartheta - \bar{\vartheta})(s) \right\|_{L^2(\partial \Omega)}^2 = \sum_{i=6}^{13} I_i(t),
\]

for all \( t \in (0, T) \), where

\[
\begin{align*}
    I_6(t) &= \int_0^t \left( c_0 (\theta_0 - \theta_0) - L(\chi_{1,0} - \chi_{1,0\mathcal{P}}), (\vartheta - \bar{\vartheta})(s) \right) \, ds, \\
    I_7(t) &= \int_0^t \left( c_0 (\vartheta - \Theta)(s), (\vartheta - \bar{\vartheta})(s) \right) \, ds, \\
    I_8(t) &= \int_0^t \left( L(\chi_1 - \chi_1) \right)(s), (\vartheta - \bar{\vartheta})(s) \right) \, ds, \\
    I_9(t) &= \int_0^t \left( \int_0^s (F - \bar{F})(r) \, dr, (\vartheta - \bar{\vartheta})(s) \right) \, ds, \\
    I_{10}(t) &= \eta \left\{ \int_0^t \int_{\partial \Omega} \left( \int_0^s (f - \bar{f})(r) \, dr \right)(\vartheta - \bar{\vartheta})(s) \, d\Gamma \right\} \, ds, \\
    I_{11}(t) &= - \int_0^t \left( (\vartheta_0 \alpha'(\theta_0) - \alpha(\theta_0)) \chi_{2,0} \, \text{div} \, \mathbf{u}_0 \\
    - (\theta_0 \alpha'(\theta_0) - \alpha(\theta_0)) \chi_{2,0\mathcal{P}} \, \text{div} \, \mathbf{u}_0, (\vartheta - \bar{\vartheta})(s) \right) \, ds,
\end{align*}
\]
Next, we control (6.12). In order to bound (6.13), we handle $I_6(t)$, $I_7(t)$, and $I_8(t)$ as follows:

\[
I_6(t) \leq \frac{C_2}{52} \| \vartheta - \Theta \|_{L^2(0,t;L^2(\Omega))}^2 \\
+ C \left( \| \vartheta_0 - \vartheta_0\| + \| \chi_{1,0} - \chi_{1,0}\| + \tau \right)^2 
\]

(6.10)

\[
I_7(t) \leq \frac{C_2}{52} \| \vartheta - \Theta \|_{L^2(0,t;L^2(\Omega))}^2 + C\tau^2, 
\]

(6.11)

\[
I_8(t) \leq \frac{C_2}{52} \| \vartheta - \Theta \|_{L^2(0,t;L^2(\Omega))}^2 + C\tau^2, 
\]

(6.12)

Next, we control $I_9(t)$ by virtue of (6.22) and (6.3) as

\[
I_9(t) \leq \frac{C_2}{52} \| \vartheta - \Theta \|_{L^2(0,t;L^2(\Omega))}^2 \\
+ C \left( \| F - \bar{F} \|_{L^2(0,t;L^2(\Omega))} + \tau \right)^2 
\]

(6.13)

Regarding $I_{10}(t)$, relation (6.22) and an integration by parts yield

\[
I_{10}(t) \leq \eta \left| \int_{\partial\Omega} \left( \int_0^t (f - \bar{f})(s) ds \right) \left( \int_0^t (\vartheta - \bar{\Theta})(s) ds \right) d\Gamma \right| \\
+ \eta \left| \int_0^t \left( \int_{\partial\Omega} (f - \bar{f})(s) \left( \int_0^s (\vartheta - \bar{\Theta})(r) dr \right) d\Gamma ds \right| \\
\leq \frac{\eta}{4} \left\| \int_0^t (\vartheta - \bar{\Theta})(s) ds \right\|_{L^2(\Omega)}^2 + C \| f - \bar{F} \|_{L^2(0,T;L^2(\partial\Omega))}^2 \\
+ \eta \int_0^t \|(f - \bar{f})(s)\|_{L^2(\partial\Omega)} \left\| \int_0^s (\vartheta - \bar{\Theta})(r) dr \right\|_{L^2(\partial\Omega)} ds. 
\]

(6.14)

In order to bound $I_{11}(t)$, we reason as follows:

\[
I_{11}(t) = I_{14}(t) + I_{15}(t) + I_{16}(t), 
\]
Hence, owing to (2.6), (2.14), (2.24), (3.11), (3.24)-(3.25), and (4.3), one obtains

\[ I_{14}(t) = -\int_0^t \left( (\varphi_0 \alpha'(\varphi_0) - \alpha(\varphi_0)) - (\varphi_{0\varphi} \alpha'(\varphi_{0\varphi}) - \alpha(\varphi_{0\varphi})) \right) \chi_{2,0} \text{div} \mathbf{u}_0, \]

\[ (\vartheta - \overline{\Theta})(s) \] ds,

\[ I_{15}(t) = -\int_0^t \left( (\varphi_{0\varphi} \alpha'(\varphi_{0\varphi}) - \alpha(\varphi_{0\varphi})) \right) (\chi_{2,0} - \chi_{2,0\varphi}) \text{div} \mathbf{u}_0, (\vartheta - \overline{\Theta})(s) \] ds,

\[ I_{16}(t) = -\int_0^t \left( (\varphi_{0\varphi} \alpha'(\varphi_{0\varphi}) - \alpha(\varphi_{0\varphi})) \chi_{2,0\varphi} \left( \text{div} \mathbf{u}_0 - \text{div} \mathbf{u}_{0\varphi} \right), (\vartheta - \overline{\Theta})(s) \] ds.

Hence, owing to (2.6), (2.14), (2.24), (3.11), (3.24)-(3.25), and (4.3), one obtains

\[ I_{14}(t) \leq \varrho_c c_K C I_0 \int_0^t \| \vartheta_0 - \varphi_{0\varphi} \| \| (\vartheta - \overline{\Theta})(s) \| \] ds \leq \frac{C_2}{52} \| \vartheta - \Theta \|_{L^2(0,t;L^2(\Omega))}^2 + C \tau^2, \tag{6.15} \]

\[ I_{15}(t) \leq 2 \varrho_c^2 c_K C_1 \int_0^t \| \chi_{2,0} - \chi_{2,0\varphi} \| \| (\vartheta - \overline{\Theta})(s) \| \] ds \leq \frac{C_2}{52} \| \vartheta - \Theta \|_{L^2(0,t;L^2(\Omega))}^2 + C \tau^2, \tag{6.16} \]

\[ I_{16}(t) \leq 2 \varrho_c^2 c_K C_1 \int_0^t \| \text{div} \mathbf{u}_0 - \text{div} \mathbf{u}_{0\varphi} \| \| (\vartheta - \overline{\Theta})(s) \| \] ds \leq \frac{C_2}{52} \| \vartheta - \Theta \|_{L^2(0,t;L^2(\Omega))}^2 + C \tau^2. \tag{6.17} \]

Thus, collecting (6.15)-(6.17), we have

\[ I_{11}(t) \leq \frac{3C_2}{52} \| \vartheta - \Theta \|_{L^2(0,t;L^2(\Omega))}^2 + C \tau^2. \tag{6.18} \]

The same analysis exploited for \( I_{11}(t) \) applies to \( I_{12}(t) \) as well. For instance, consider

\[ I_{12}(t) = I_{17}(t) + I_{18}(t) + I_{19}(t), \]

where

\[ I_{17}(t) = \int_0^t \left( \left( (\varphi_{0\varphi}'(\varphi_0) - \alpha(\varphi_0)) - (\Theta \alpha'(\Theta) - \alpha(\Theta)) \right) \chi_{2,0} \text{div} \mathbf{u}(s), (\vartheta - \overline{\Theta})(s) \right) ds, \]

\[ I_{18}(t) = \int_0^t \left( (\Theta \alpha'(\Theta) - \alpha(\Theta)) \right) (\chi_{2,0} - \chi_{2,0\varphi}) \text{div} \mathbf{u}(s), (\vartheta - \overline{\Theta})(s) \right) ds, \]

\[ I_{19}(t) = \int_0^t \left( (\Theta \alpha'(\Theta) - \alpha(\Theta)) \chi_{2,0}(\text{div} \mathbf{u} - \text{div} \mathbf{U}(s), (\vartheta - \overline{\Theta})(s) \right) ds. \]
By virtue of relations (2.6), (2.24), (2.14), and (4.3), one infers that

\[
I_{17}(t) \leq \vartheta_c c_K C_1 \int_0^t \| (\vartheta - \Theta)(s) \| \| (\vartheta - \overline{\Theta})(s) \| \, ds \\
= \vartheta_c c_K C_1 \left( \| \vartheta - \Theta \|^2_{L^2(0,t;L^2(\Omega))} + \int_0^t \| (\vartheta - \Theta)(s) \| \| (\Theta - \overline{\Theta})(s) \| \, ds \right) \\
\leq \left( \vartheta_c c_K C_1 + \frac{C_2}{52} \right) \| \vartheta - \Theta \|^2_{L^2(0,t;L^2(\Omega))} + C \tau^2,
\]

(6.19)

\[
I_{18}(t) \leq 2 \vartheta_c^2 c_K C_1 \int_0^t \| (\chi_2 - \chi_2)(s) \| \| (\vartheta - \overline{\Theta})(s) \| \, ds \\
\leq \frac{C_2}{52} \| \vartheta - \Theta \|^2_{L^2(0,t;L^2(\Omega))} + C \left( \int_0^t \| (\chi_2 - \chi_2)(s) \|^2 \, ds + \tau^2 \right),
\]

(6.20)

\[
I_{19}(t) \leq 2 \vartheta_c^2 c_K \int_0^t \| (\text{div } u - \text{div } U)(s) \| \| (\vartheta - \overline{\Theta})(s) \| \, ds.
\]

(6.21)

The reader should notice that the term \( \vartheta_c c_K C_1 \| \vartheta - \Theta \|^2_{L^2(0,t;L^2(\Omega))} \) in (6.19) is to be handled by means of the non-degeneracy assumption (2.25). On the other hand, let us stress that the term \( I_{19}(t) \) will be controlled jointly with the forthcoming term \( I_{20}(t) \) by making a crucial use of (2.26). Moreover, according to (6.19)–(6.21), we conclude that

\[
I_{12}(t) \leq \left( \vartheta_c c_K C_1 + \frac{C_2}{26} \right) \| \vartheta - \Theta \|^2_{L^2(0,t;L^2(\Omega))} + 2 \vartheta_c^2 c_K \int_0^t \| (\text{div } u - \text{div } U)(s) \| \| (\vartheta - \overline{\Theta})(s) \| \, ds \\
+ C \left( \int_0^t \| (\chi_2 - \chi_2)(s) \|^2 \, ds + \tau^2 \right).
\]

(6.22)

Finally, we deal with the residual term \( I_{13}(t) \). It is straightforward to obtain that

\[
I_{13}(t) \leq \frac{C_2}{52} \| \vartheta - \Theta \|^2_{L^2(0,t;L^2(\Omega))} + C \left( \| (\Theta \alpha'(\Theta) - \alpha(\Theta)) \chi_2 \text{div } U \|_p \\
- (\Theta_p \alpha'(\Theta_p) - \alpha(\Theta_p)) \chi_2 \text{div } U_p \|_{L^2(\Omega)} + \tau^2 \right),
\]

and, recalling (2.6), (2.12), and (2.24), an application of Lemma 4.2 with the choice \( E = (L^2(\Omega))^3 \) and \( F = L^2(\Omega) \) yields

\[
I_{13}(t) \leq \frac{C_2}{52} \| \vartheta - \Theta \|^2_{L^2(0,t;L^2(\Omega))} + C \tau^2.
\]

(6.23)
Regarding the displacements, let us consider the difference between (2.19) and (3.20) and set \( \mathbf{v} = (\mathbf{u} - \overline{\mathbf{U}})(t) \). One has

\[
a(\mathbf{u} - \overline{\mathbf{U}}, \mathbf{u} - \overline{\mathbf{U}}) + (\alpha(\vartheta) - \alpha(\overline{\vartheta})) \chi_2, \text{div} \mathbf{u} - \text{div} \overline{\mathbf{U}}
\]

\[
= \int_\Omega (\mathbf{G} - \overline{\mathbf{G}}) \cdot (\mathbf{u} - \overline{\mathbf{U}}) \, dx + \int_{\Gamma_N} (\mathbf{g} - \overline{\mathbf{g}}) \cdot (\mathbf{u} - \overline{\mathbf{U}}) \, d\Gamma \quad \text{a.e. in } (0, T).
\]

Now, we take the integral over \((0, t)\) for \(t \in (0, T)\). Since we have (2.3)-(2.4), it is straightforward to deduce that

\[
\frac{CV}{2} \| (\mathbf{u} - \overline{\mathbf{U}})(t) \|_{L^2(0, t; \mathbf{V})}^2 + \frac{(\lambda + 2\mu/3)}{24} \| (\text{div} \mathbf{u} - \text{div} \overline{\mathbf{U}})(t) \|_{L^2(0, t; L^2(\Omega))}^2 \leq \sum_{i=20}^{23} I_i(t),
\]

where

\[
I_{20}(t) = - \int_0^t \left( (\alpha(\vartheta) - \alpha(\overline{\vartheta})) \chi_2(s), (\text{div} \mathbf{u} - \text{div} \overline{\mathbf{U}})(s) \right) \, ds,
\]

\[
I_{21}(t) = - \int_0^t \left( \alpha(\overline{\vartheta})(\chi_2 - \overline{\chi}_2)(s), (\text{div} \mathbf{u} - \text{div} \overline{\mathbf{U}})(s) \right) \, ds,
\]

\[
I_{22}(t) = \int_0^t \int_\Omega (\mathbf{G} - \overline{\mathbf{G}}) \cdot (\mathbf{u} - \overline{\mathbf{U}}) \, dx \, ds,
\]

\[
I_{23}(t) = \int_0^t \int_{\Gamma_N} (\mathbf{g} - \overline{\mathbf{g}}) \cdot (\mathbf{u} - \overline{\mathbf{U}}) \, d\Gamma \, ds.
\]

The previous terms may be controlled with the help of (2.6), (2.14), (3.23), and (3.3) as follows:

\[
(6.25) \quad I_{20}(t) \leq \vartheta_c a_\vartheta c_\vartheta \int_0^t \| (\vartheta - \overline{\vartheta})(s) \| \| (\text{div} \mathbf{u} - \text{div} \overline{\mathbf{U}})(s) \| \, ds,
\]

\[
I_{21}(t) \leq \frac{(\lambda + 2\mu/3)}{24} \| \text{div} \mathbf{u} - \text{div} \overline{\mathbf{U}} \|_{L^2(0, t; L^2(\Omega))}^2 + C \left( \int_0^t \| (\chi_2 - \overline{\chi}_2)(s) \|_{L^2(\Omega)}^2 \, ds + \tau^2 \right),
\]

\[
(6.26) \quad I_{22}(t) \leq \frac{CV}{8} \| \mathbf{u} - \overline{\mathbf{U}} \|_{L^2(0, t; \mathbf{V})}^2 + C \| \mathbf{G} - \overline{\mathbf{G}} \|_{L^2(0, T; \mathbf{V})}^2 + C \tau^2,
\]

\[
(6.27) \quad I_{23}(t) \leq \frac{CV}{8C^2 V} \| \mathbf{u} - \overline{\mathbf{U}} \|_{L^2(0, t; \mathbf{V})}^2 + C \| \mathbf{g} - \overline{\mathbf{g}} \|_{L^2(0, T; \mathbf{V})}^2 + C \tau^2,
\]

where the constant \( C_\vartheta \) stands for the norm of the trace operator from \( \mathbf{V} \) to \( (L^2(\Gamma_N))^3 \). Once again we choose the arbitrary constants in the right hand side of relations (6.20)-(6.23) in order to fit the forthcoming analysis.
Next, we take the sum between (6.1), (6.3), and (6.4). At this point the role of assumption (2.26) becomes clear, since it and (4.3) ensure that
\[
\left( \partial_v (2 \partial_v + 1) c \frac{\alpha}{c} \right) \int_0^t \left\| (\partial - \overline{\Theta})(s) \right\| \left\| (\text{div} \, \mathbf{u} - \text{div} \, \overline{\mathbf{U}})(s) \right\| \, ds \\
\leq \frac{3C_2}{4} \left\| \partial v - \overline{\Theta} \right\|_{L^2(0,t;L^2(\Omega))}^2 + \frac{3}{3} \left\| \text{div} \, \mathbf{u} - \text{div} \, \overline{\mathbf{U}} \right\|_{L^2(0,t;L^2(\Omega))}^2 \\
\leq \frac{3C_2}{4} \left\| \partial v - \overline{\Theta} \right\|_{L^2(0,t;L^2(\Omega))}^2 + \frac{3}{3} \left\| \text{div} \, \mathbf{u} - \text{div} \, \overline{\mathbf{U}} \right\|_{L^2(0,t;L^2(\Omega))}^2 + C \tau^2.
\]
As a first consequence of the previous inequality we have that the sum \( I_{19}(t) + I_{20}(t) \) is controlled by the right hand side above (provided that the constant \( C \) is properly modified).

Thus, by virtue of (2.26) and taking into account (6.1), (6.3), (6.4), (6.5), (6.6), (6.10), (6.11), (6.12), (6.13), (6.14), and (6.25)-(6.28), one obtains, for all \( t \in (0,T) \),
\[
\frac{C_2}{52} \left\| \partial v - \overline{\Theta} \right\|_{L^2(0,t;L^2(\Omega))}^2 + \frac{h}{2} \left\| \left( \int_0^t (\partial - \overline{\Theta})(s) \, ds \right) \right\|_{L^2(\Omega)}^2 \\
+ \frac{\eta}{4} \left\| \int_0^t (\partial - \overline{\Theta})(s) \, ds \right\|_{L^2(\partial \Omega)}^2 + \frac{\gamma}{4} \left\| \mathbf{u} - \overline{\mathbf{U}} \right\|_{L^2(0,t;\nabla)}^2 \\
+ \frac{\lambda + 2 \mu/3}{12} \left\| \text{div} \, \mathbf{u} - \text{div} \, \overline{\mathbf{U}} \right\|_{L^2(0,t;L^2(\Omega))}^2 + \frac{\beta}{2} \sum_{j=1}^2 \left\| (\chi_j - \chi_j)(t) \right\|_{L^2(\partial \Omega)}^2 \\
\leq C \left( I_{19}(t) + I_{20}(t) \right) \\
+ \frac{\lambda + 2 \mu/3}{12} \left\| \text{div} \, \mathbf{u} - \text{div} \, \overline{\mathbf{U}} \right\|_{L^2(0,t;L^2(\Omega))}^2 + \tau^2.
\]
Finally, an application of Gronwall’s lemma, along with relations (3.23) and (4.3), concludes the proof of Theorem 3.3.

Remark 6.1. Let us briefly comment on the technical motivation for neglecting the term \( \alpha(\partial_v) \chi_2 \partial_v (\text{div} \, \mathbf{u}) \) in (1.4). The latter motivation is connected with the earlier paper [3], in which Chemetov dealt with the uniqueness of a solution to the full three-dimensional Frémond model by reasoning by contradiction. The presence of the nonlinear term \( \alpha(\partial_v) \chi_2 \partial_v (\text{div} \, \mathbf{u}) \) forced him to establish a local in time Gronwall type estimate. Thus, the uniqueness of a solution is proved in the time interval \([0,T^*)\) for a suitably small time \( T^* < T \) and the argument is iterated to ensure uniqueness on the whole interval \([0,T)\). Unfortunately, the latter local in time procedure is not adequate for the purpose of the error analysis, and we need to establish a Gronwall estimate up to the reference time \( T \). In this respect (see also \[3\]), it turns out to be possible to prove such a global in time Gronwall estimate by neglecting the term \( \alpha(\partial_v) \chi_2 \partial_v (\text{div} \, \mathbf{u}) \) in the full energy balance equation (1.4).
