LINEAR DIFFERENCE EQUATIONS
WITH TRANSITION POINTS

Z. WANG AND R. WONG

Abstract. Two linearly independent asymptotic solutions are constructed for
the second-order linear difference equation
\[ y_{n+1}(x) - (A_n x + B_n) y_n(x) + y_{n-1}(x) = 0, \]
where \( A_n \) and \( B_n \) have power series expansions of the form
\[ A_n \sim \sum_{s=0}^{\infty} \alpha_s n^s, \quad B_n \sim \sum_{s=0}^{\infty} \beta_s n^s \]
with \( \alpha_0 \neq 0 \). Our results hold uniformly for \( x \) in an infinite interval containing
the transition point \( x_+ \) given by \( \alpha_0 x_+ + \beta_0 = 2 \). As an illustration, we present
an asymptotic expansion for the monic polynomials \( \pi_n(x) \) which are orthogonal
with respect to the modified Jacobi weight
\[ w(x) = (1 - x)^{\alpha} (1 + x)^{\beta} h(x), \quad x \in (-1, 1), \]
where \( \alpha, \beta > -1 \) and \( h \) is real analytic and strictly positive on
\([-1, 1]\).

1. Introduction

Ever since Deift and Zhou [7] introduced the steepest descent method for
Riemann-Hilbert problems, there has been a considerable amount of activities in
the study of asymptotics of orthogonal polynomials by using this approach. For
instance, in [8] Deift et al. studied the asymptotics of orthogonal polynomials with
respect to the weight \( w(x) = e^{-Q(x)} \) on the real line, where \( Q(x) \) is a polynomial of
even degree with positive leading coefficient, and they obtained uniform Plancherel-
Rotach-type asymptotics in the entire complex plane. Also, in [11] Kuijlaars and
McLaughlin used this method to investigate the asymptotic behavior of Laguerre
polynomials \( L_n^{(\alpha_n)}(x) \), where \( \alpha_n \) is a sequence of negative numbers such that \( -\alpha_n/n \)
tends to a limit \( A > 1 \) as \( n \to \infty \). Furthermore, Kuijlaars et al. [12, 13] considered
the asymptotics of the polynomials that are orthogonal with respect to the modified
Jacobi weight
\[ w(x) = (1 - x)^{\alpha} (1 + x)^{\beta} h(x), \quad x \in (-1, 1), \]
where \( \alpha, \beta > -1 \) and the extra factor \( h \) is real analytic and strictly positive on
\([-1, 1]\). For other investigations of a similar nature, we refer to [3, 4, 6, 10, 18]. An
advantage of this new approach over the more classical asymptotic methods is that it

is applicable to orthogonal polynomials which do not have an integral representation or satisfy a second-order differential equation. Examples of such cases are provided by the two sets of orthogonal polynomials mentioned above, namely those associated with (i) the exponential weight and (ii) the modified Jacobi weight. However, so far this new method has not been able to produce results as strong as those obtainable from the classical approaches when an integral representation is available or when the differential equation theory can be applied. For instance, in the case of Meixner-Pollaczek polynomials $M_n(x; \delta, \eta)$, one can use a Cauchy integral representation to derive an infinite asymptotic expansion for $M_n(\alpha n; \delta, \eta)$, which holds uniformly for $-M \leq \alpha \leq M$, where $M$ can be any positive number; see [14]. Also, when the polynomial $Q(x) = x^{2m} + \cdots$ in the weight function $w(x) = e^{-Q(x)}$ is even and convex, one can use the turning point theory for differential equations to obtain an asymptotic formula for the polynomials $p_n(x)$ orthogonal with respect to $w(x)$, which holds uniformly in the unbounded interval $0 \leq x \leq O(n^{1/2m})$; see [16].

In our view, a desirable approach to derive asymptotic expansions for orthogonal polynomials now is to develop an asymptotic theory for linear second-order difference equations, just like what Langer, Cherry, Olver and others have done for linear differential equations; see the definitive book by Olver [13]. Our view is based on the fact that any sequence of orthogonal polynomials satisfies the three-term recurrence relation

$$p_{n+1}(x) = (a_n x + b_n) p_n(x) - c_n p_{n-1}(x), \quad n = 1, 2, \ldots,$$

(1.2)

where $a_n$, $b_n$ and $c_n$ are constants. If we define a sequence $\{K_n\}$ recursively by $K_{n+1}/K_{n-1} = c_n$, with $K_0$ and $K_1$ depending on the particular sequence of polynomials, and if we put $A_n \equiv a_n K_n/K_{n+1}$, $B_n \equiv b_n K_n/K_{n+1}$ and $P_n(x) \equiv p_n(x)/K_n$, then (1.2) can be written as

$$P_{n+1}(x) - (A_n x + B_n) P_n(x) + P_{n-1}(x) = 0.$$

(1.3)

We shall assume that the coefficients $A_n$ and $B_n$ are real and have asymptotic expansions of the form

$$A_n \sim n^{-\theta} \sum_{s=0}^{\infty} \frac{\alpha_s}{n^s} \quad \text{and} \quad B_n \sim \sum_{s=0}^{\infty} \frac{\beta_s}{n^s},$$

(1.4)

where $\theta$ is a real number and $\alpha_0 \neq 0$. If $x$ is a fixed number, then asymptotic solutions to (1.3) can be obtained from existing results in the literature; see, e.g., the papers by Birkhoff [11] and Birkhoff and Trjitzinsky [2]. These papers, however, have been considered far too complicated and even impenetrable. For a more accessible account of the asymptotic behavior of the solutions to equation (1.3), we refer to the two more recent papers by Wong and Li [21, 22]. When $x$ is a parameter and is allowed to vary, then not much work has been done in this area until just recently. In [20], we have studied a case in which the exponent $\theta$ in (1.4) is not zero. This case corresponds to the turning-point problem for second-order linear differential equations, and the asymptotic expansions derived for the solutions involve the Airy functions $Ai(\cdot)$, $Bi(\cdot)$ and their derivatives; see also [19]. In this paper, we shall consider the case $\theta = 0$ in (1.3). The approximants of the asymptotic solutions turn out to be Bessel functions or modified Bessel functions. As an illustration, we shall present an infinite asymptotic expansion for the monic polynomials which are orthogonal with respect to the modified Jacobi weight given in (1.1). Our expansion will hold uniformly for $x$ in $[-1 + \delta, \infty)$, $\delta > 0$. Although
we will make use of a result of Kuijlaars et al. [12] on the coefficients of a relevant recurrence relation, our result for the modified Jacobi polynomials is stronger than those given in their papers [12, 13].

The presentation of this paper is arranged as follows. In Section 2, we show how the Bessel functions arise in the asymptotic solutions. In Section 3, we give a preliminary lemma which is crucial to the derivation of the asymptotic expansions. The construction of the formal solutions is presented in Section 4. In Section 5, we establish the asymptotic nature of the expansions. The final section is devoted to a study of the orthogonal polynomials with the modified Jacobi weight.

2. Motivation leading to the expansion

Returning to (1.3), we try a solution of the form

\[ P_n(x) = \lambda^n \text{ and replace the coefficients } A_n \text{ and } B_n \text{ by their respective asymptotic expansions given in (1.4)} \]

with \( \theta = 0 \). Upon letting \( n \to \infty \), this yields the characteristic equation

\[ \lambda^2 - (\alpha_0 x + \beta_0)\lambda + 1 = 0. \]

The roots of this equation are

\[ \lambda_\pm = \frac{1}{2} \left[ \alpha_0 x + \beta_0 \pm \sqrt{(\alpha_0 x + \beta_0)^2 - 4} \right], \]

and they coincide when \( x = x_\pm \), where \( x_\pm \) satisfy

\[ \alpha_0 x_\pm + \beta_0 = \pm 2. \]

The points \( x_+ \) and \( x_- \) are called transition points in [20]. Throughout this paper, we shall assume that

\[ \alpha_1 = \beta_1 = 0. \]

This assumption naturally implies the condition

\[ \alpha_1 x_+ + \beta_1 = 0, \]

which was used in our previous paper on turning point theory; see equation (2.7) in [20]. It is interesting to note that in a paper on WKB methods for difference equations, Dingle and Morgan [8, 9] also assumed this condition. In fact, they assumed the stronger condition that all coefficients \( \alpha_s \) and \( \beta_s \) in (1.4) with odd indices vanish. (We believe that under assumption (1.4), condition (2.4) for the three-term recurrence relation (1.3) is probably satisfied by all orthogonal polynomials in the Szegö class. This possibility is currently under investigation.) Note that since \( \tilde{P}_n(x) \equiv (-1)^n P_n(x) \) satisfies the recurrence relation

\[ \tilde{P}_{n+1}(x) + (A_n x + B_n) \tilde{P}_n(x) + \tilde{P}_{n-1}(x) = 0, \]

we may, without loss of generality, assume \( \alpha_0 > 0 \).

Now let \( \tau_0 := -(\alpha_3 x_+ + \beta_3)/2(\alpha_2 x_+ + \beta_2) \); cf. (4.20) below. Define \( N := n + \tau_0 \) and recast the expansions in (1.4), with \( \theta = 0 \), in terms of \( N \). This gives

\[ A_n \sim \sum_{s=0}^{\infty} \frac{\alpha'_s}{N^s} \quad \text{and} \quad B_n \sim \sum_{s=0}^{\infty} \frac{\beta'_s}{N^s}, \]

with \( \alpha'_0 = \alpha_0 > 0 \) and \( \alpha'_1 = \beta'_1 = 0 \). Since the transition points \( x_+ \) and \( x_- \) in (2.3) are distinct, we may restrict ourselves to just the case \( x = x_+ \). As in [20], we try a
formal solution of the form

\[ P_n(x) = \sum_{s=0}^{\infty} X_s(\xi) N^{-s} \]  

for \( x \) near \( x_+ \), where \( \xi \) depends on \( x \) and \( N \). In this paper, we choose \( \xi = N\zeta^{1/2}(x) \), where \( \zeta(x) \) is an increasing function with \( \zeta(x_+) = 0 \). Clearly,

\[ P_{n+1}(x) = \sum_{s=0}^{\infty} X_s((N+1)\zeta^{1/2}(x))(N+1)^{-s} \]

\[ = \sum_{s=0}^{\infty} X_s \left[ (1 + \frac{1}{N})\xi \right] N^{-s}(1 + \frac{1}{N})^{-s}. \]

By expanding \( X_s(\xi + \frac{\xi}{N}) \) into a Taylor series and using the binomial expansion, we obtain

\[ P_{n+1}(x) = \sum_{l=0}^{\infty} \frac{1}{N^l} \sum_{s=0}^{l} \left[ \sum_{j=0}^{l-s} X_s^{(j)}(\xi) \frac{\xi^j}{j!} \right] \left( \frac{-s}{l-j-s} \right). \]

Similarly,

\[ P_{n-1}(x) = \sum_{l=0}^{\infty} \frac{1}{N^l} \sum_{s=0}^{l} \left[ (-1)^{l-s} \sum_{j=0}^{l-s} X_s^{(j)}(\xi) \frac{\xi^j}{j!} \right] \left( \frac{-s}{l-j-s} \right). \]

Since \( \xi = N\zeta^{1/2}(x) \), we also have

\[ x = \zeta^{-1}(\xi^2/N^2) = \sum_{j=0}^{\infty} \frac{1}{j!}(D^j\zeta^{-1})(0)\frac{\xi^{2j}}{N^{2j}}, \]

where \( D^j \) denotes the \( j \)-th derivative of \( \zeta^{-1} \). From (2.6) and (2.10), it follows that

\[ A_n x + B_n = \sum_{s=0}^{\infty} \frac{Q_s(\xi)}{N^s}, \]

where \( Q_0(\xi) = \alpha_0' x_+ + \beta_0' = 2 \), \( Q_1(\xi) = \alpha_1' x_+ + \beta_1' = 0 \) by (2.5), and

\[ Q_s(\xi) = \beta_s' + \sum_{2j\leq s} \frac{1}{j!}(D^j\zeta^{-1})(0)\alpha_{s-2j}'\xi^{2j}, \quad s = 2, 3, \ldots. \]

Upon substituting (2.7), (2.8), (2.9) and (2.12) into (1.3), we find that \( X_0(\xi) \) satisfies the Bessel equation

\[ \frac{d^2X_0}{d\xi^2} = \left( \frac{\alpha_0'}{\zeta'(0)} + \frac{\alpha_1' x_+ + \beta_1'}{\xi} \right) X_0. \]

Thus, it follows that \( X_0(\xi) \) can be expressed in terms of either the Bessel functions \( J_\nu(\xi) \) and \( Y_\nu(\xi) \) or the modified Bessel functions \( I_\nu(\xi) \) and \( K_\nu(\xi) \). That is, there are constants \( C_1 \) and \( C_2 \) such that

\[ X_0(\xi) = C_1\xi^{1/2}J_\nu(\xi) + C_2\xi^{1/2}Y_\nu(\xi) \quad \text{if} \quad \alpha_0' < 0, \]

and

\[ X_0(\xi) = C_1\xi^{1/2}I_\nu(\xi) + C_2\xi^{1/2}K_\nu(\xi) \quad \text{if} \quad \alpha_0' > 0, \]
Theorem. Assume that the coefficients $A_n$ and $B_n$ in the recurrence relation (1.3) are real, and have asymptotic expansions given in (1.4) with $\theta = 0$. Let $x_\pm$ be the transition points defined in (2.3),

\[
\zeta^{1/2} = \cosh^{-1}(\alpha_0 x + \beta_0)/2 \quad \text{and} \quad \tau_0 = -(\alpha_3 x_+ + \beta_3)/2(\alpha_2 x_+ + \beta_2).
\]

Then, for each nonnegative integer $p$, equation (1.3) has a pair of linearly independent solutions

\[
P_n(x) = \left(\frac{4\zeta}{(\alpha_0 x + \beta_0)^2 - 4}\right)^{1/2} \left[N^{1/2} I_\nu(N\zeta^{1/2}) \sum_{s=0}^N \frac{A_s(\zeta)}{N^s} + N^{1/2} \zeta^{1/2} I_{\nu-1}(N\zeta^{1/2}) \sum_{s=0}^N \frac{B_s(\zeta)}{N^s} + \varepsilon_p(N, x)\right],
\]

and

\[
Q_n(x) = \left(\frac{4\zeta}{(\alpha_0 x + \beta_0)^2 - 4}\right)^{1/2} \left[N^{1/2} K_\nu(N\zeta^{1/2}) \sum_{s=0}^N \frac{A_s(\zeta)}{N^s} - N^{1/2} \zeta^{1/2} K_{\nu-1}(N\zeta^{1/2}) \sum_{s=0}^N \frac{B_s(\zeta)}{N^s} + \delta_p(N, x)\right],
\]

where $N = n + \tau_0$ and $\nu$ is given in (2.14). The error terms satisfy

\[
|\varepsilon_p(N, x)| \leq \frac{M_p}{N^{\nu+2}} \max \left[|I_\nu(N\zeta^{1/2})| + |I_{\nu-1}(N\zeta^{1/2})|\right]
\]
and
\begin{equation}
|\delta_p(N, x)| \leq \frac{M_p}{N^{p+\frac{1}{2}}} [ |K_\nu(N\zeta^{\frac{1}{2}})| + |K_{\nu - 1}(N\zeta^{\frac{1}{2}})| ]
\end{equation}
for \( x_{-} + \delta \leq x < \infty \), where \( M_p \) is a positive constant. The coefficients \( A_s(\zeta) \) and \( B_s(\zeta) \) can be determined successively for any given \( A_0(\zeta) \) and \( B_0(\zeta) \); see (4.11) and (4.12).

To see how the function \( \zeta(x) \) and the constant \( \tau_0 \) in the above theorem are chosen, we refer to Section 4; see, in particular, (4.8) and (4.20).

3. A PRELIMINARY LEMMA

When we replace \( n \) by \( n + 1 \), the two functions \( Z_\nu(N\zeta^{1/2}) \) and \( Z_{\nu-1}(N\zeta^{1/2}) \) in (2.15) become \( Z_\nu([N + 1]\zeta^{1/2}) \) and \( Z_{\nu-1}([N + 1]\zeta^{1/2}) \). An important connection between the second two functions and the first two is given in the following lemma, which plays a crucial role in the derivation of the formal series solution (2.15).

**Lemma 1.** Let \( Z_\nu(x) \) be any solution of the modified Bessel equation (2.16), which satisfies
\begin{equation}
Z_{\nu-1}(x) = Z'_\nu(x) + \left( \frac{\nu}{x} \right) Z_\nu(x).
\end{equation}

We have
\begin{equation}
(1 + \frac{\theta}{N})^{1/2} Z_\nu([N + \theta]\zeta^{1/2}) = Z_\nu(N\zeta^{1/2})G(N; \theta, \zeta) + \zeta^{1/2} Z_{\nu-1}(N\zeta^{1/2})H(N; \theta, \zeta)
\end{equation}
and
\begin{equation}
(1 + \frac{\theta}{N})^{1/2} Z_{\nu-1}([N + \theta]\zeta^{1/2}) = \zeta^{1/2} Z_\nu(N\zeta^{1/2})L(N; \theta, \zeta) + Z_{\nu-1}(N\zeta^{1/2})K(N; \theta, \zeta),
\end{equation}
where
\begin{align*}
G(N; \theta, \zeta) &\sim \sum_{s=0}^{\infty} \frac{G_s(\theta, \zeta)}{N^s}, & H(N; \theta, \zeta) &\sim \sum_{s=0}^{\infty} \frac{H_s(\theta, \zeta)}{N^s}, \\
L(N; \theta, \zeta) &\sim \sum_{s=0}^{\infty} \frac{L_s(\theta, \zeta)}{N^s}, & K(N; \theta, \zeta) &\sim \sum_{s=0}^{\infty} \frac{K_s(\theta, \zeta)}{N^s},
\end{align*}
the expansions being uniformly valid with respect to bounded \( \theta \) and all real \( \zeta \).

**Proof.** Let \( w(\theta, \zeta) = (1 + \theta/N)^{1/2} Z_\nu([N + \theta]\zeta^{1/2}) \). Straightforward calculation gives
\begin{equation}
\frac{\partial w}{\partial \theta} = \left( \frac{\zeta}{N} \right)^{1/2} \left( 1 + \frac{\theta}{N} \right)^{-1/2} Z_\nu + \left( 1 + \frac{\theta}{N} \right)^{1/2} \zeta^{1/2} Z_{\nu-1}
\end{equation}
and
\begin{equation}
\frac{\partial^2 w}{\partial \theta^2} = \left( \zeta + \frac{\nu^2 - \frac{1}{4}}{(N + \theta)^2} \right) w.
\end{equation}
The last equation can also be obtained directly from (2.16) by eliminating the term involving the first derivative. From Taylor’s expansion,

\[ w(\theta, \zeta) = w(0, \zeta) + \frac{\partial w}{\partial \theta}(0, \zeta)\theta + \frac{1}{2!} \frac{\partial^2 w}{\partial \theta^2}(0, \zeta)\theta^2 + \cdots. \]

In view of (3.6) and (3.7), this series can be rearranged as

\[ (3.8) \quad \left(1 + \frac{\theta}{N}\right)^{\frac{1}{2}} Z_{\nu}(N + \theta \zeta^{\frac{1}{2}}) = Z_{\nu}(N \zeta^{\frac{1}{2}})G(N; \theta, \zeta) + \zeta^{\frac{1}{2}} Z_{\nu-1}(N \zeta^{\frac{1}{2}})H(N; \theta, \zeta), \]

where \( G(N; 0, \zeta) = 1, H(N; 0, \zeta) = 0, \)

\[ \frac{\partial G}{\partial \theta}(N; 0, \zeta) = \frac{\nu^2 - \frac{1}{4}}{N} \quad \text{and} \quad \frac{\partial H}{\partial \theta}(N; 0, \zeta) = 1. \]

Differentiating (3.8) with respect to \( \theta \) yields

\[ (3.9) \quad \frac{\partial^2 G}{\partial \theta^2} = \left( \zeta + \frac{\nu^2 - \frac{1}{4}}{(N + \theta)^2} \right) G, \quad G \bigg|_{\theta=0} = 1, \quad \frac{\partial G}{\partial \theta} \bigg|_{\theta=0} = \frac{\nu^2 - \frac{1}{4}}{N} \]

and

\[ (3.10) \quad \frac{\partial^2 H}{\partial \theta^2} = \left( \zeta + \frac{\nu^2 - \frac{1}{4}}{(N + \theta)^2} \right) H, \quad H \bigg|_{\theta=0} = 0, \quad \frac{\partial H}{\partial \theta} \bigg|_{\theta=0} = 1. \]

The solutions to these two differential equations have formal asymptotic solutions

\[ (3.11) \quad G = \sum_{s=0}^{\infty} \frac{G_s(\theta, \zeta)}{N^s} \quad \text{and} \quad H = \sum_{s=0}^{\infty} \frac{H_s(\theta, \zeta)}{N^s}, \]

where the coefficients can be determined recursively by the equations

\[ (3.12) \quad \begin{cases} \frac{\partial^2 G_0}{\partial \theta^2} - \zeta G_0 = 0, & G_0 \bigg|_{\theta=0} = 1, \quad \frac{\partial G_0}{\partial \theta} \bigg|_{\theta=0} = 0, \\ \frac{\partial^2 H_0}{\partial \theta^2} - \zeta H_0 = 0, & H_0 \bigg|_{\theta=0} = 0, \quad \frac{\partial H_0}{\partial \theta} \bigg|_{\theta=0} = 1, \end{cases} \]

\[ (3.13) \quad \begin{cases} \frac{\partial^2 G_1}{\partial \theta^2} - \zeta G_1 = 0, & G_1 \bigg|_{\theta=0} = 0, \quad \frac{\partial G_1}{\partial \theta} \bigg|_{\theta=0} = \frac{1}{2} - \nu, \\ \frac{\partial^2 H_1}{\partial \theta^2} - \zeta H_1 = 0, & H_1 \bigg|_{\theta=0} = 0, \quad \frac{\partial H_1}{\partial \theta} \bigg|_{\theta=0} = 0, \end{cases} \]

\[ (3.14) \quad \begin{cases} \frac{\partial^2 G_s}{\partial \theta^2} - \zeta G_s = \left( \nu^2 - \frac{1}{4} \right) \sum_{j=2}^{s} (-1)^j (j - 1) \theta^{j-2} G_{s-j}, & G_s \bigg|_{\theta=0} = 0, \quad \frac{\partial G_s}{\partial \theta} \bigg|_{\theta=0} = 0, \end{cases} \]

and

\[ (3.15) \quad \begin{cases} \frac{\partial^2 H_s}{\partial \theta^2} - \zeta H_s = \left( \nu^2 - \frac{1}{4} \right) \sum_{j=2}^{s} (-1)^j (j - 1) \theta^{j-2} H_{s-j}, & H_s \bigg|_{\theta=0} = 0. \end{cases} \]
for \( s \geq 2 \). These equations can be solved explicitly, and we have

\[
G_0 = \frac{1}{2} \left( e^{\sqrt{\zeta}} + e^{-\sqrt{\zeta}} \right), \quad H_0 = \frac{1}{2\sqrt{\zeta}} \left( e^{\sqrt{\zeta}} - e^{-\sqrt{\zeta}} \right),
\]

(3.16)

\[
G_1 = \frac{1}{2\sqrt{\zeta}} \left( e^{\sqrt{\zeta}} - e^{-\sqrt{\zeta}} \right), \quad H_1 = 0,
\]

(3.17)

and

\[
\begin{align*}
G_s &= \frac{\nu^2 - \frac{1}{2}}{2\sqrt{\zeta}} \int_0^\theta \left( \sum_{j=2}^s (-1)^j (j-1) \phi^{j-2} G_{s-j} \right) \left( e^{\sqrt{\zeta} (\theta - \phi)} - e^{\sqrt{\zeta} (\phi - \theta)} \right) d\phi, \\
H_s &= \frac{\nu^2 - \frac{1}{2}}{2\sqrt{\zeta}} \int_0^\theta \left( \sum_{j=2}^s (-1)^j (j-1) \phi^{j-2} H_{s-j} \right) \left( e^{\sqrt{\zeta} (\theta - \phi)} - e^{\sqrt{\zeta} (\phi - \theta)} \right) d\phi
\end{align*}
\]

(3.18)

for \( s \geq 2 \), where \( \sqrt{\zeta} = i \sqrt{-\zeta} \) if \( \zeta < 0 \). Using the inequalities

\[
\cosh x \sinh y \leq y \cosh(x + y) \quad \text{and} \quad \sinh x \sinh y \leq y \sinh(x + y),
\]

it can be proved by induction that for \( \zeta < 0 \)

\[
|G_s(\theta, \zeta)| \leq (|\nu| + 1)^s|\theta|^s \quad \text{and} \quad |H_s(\theta, \zeta)| \leq (|\nu| + 1)^s|\theta|^{s+1},
\]

(3.19)

and that for \( \zeta > 0 \)

\[
|G_s(\theta, \zeta)| \leq (|\nu| + 1)^s|\theta|^s G_0(\theta, \zeta) \quad \text{and} \quad |H_s(\theta, \zeta)| \leq (|\nu| + 1)^s|\theta|^s |H_0(\theta, \zeta)|.
\]

(3.20)

Thus, the formal series in (3.11) are uniformly convergent for any bounded \( \theta \) and sufficiently large \( N \), and (3.2) follows.

Let \( L_s(\theta, \zeta) \) and \( K_s(\theta, \zeta) \) be given as in (3.5). By the same argument, we have

\[
K_0(\theta, \zeta) = \frac{1}{2} \left( e^{\sqrt{\zeta}} + e^{-\sqrt{\zeta}} \right), \quad L_0(\theta, \zeta) = \frac{1}{2\sqrt{\zeta}} \left( e^{\sqrt{\zeta}} - e^{-\sqrt{\zeta}} \right),
\]

(3.21)

\[
K_1(\theta, \zeta) = \frac{\nu^2 - \frac{1}{2}}{2\sqrt{\zeta}} \left( e^{\sqrt{\zeta}} - e^{-\sqrt{\zeta}} \right), \quad L_1(\theta, \zeta) = 0.
\]

(3.22)

Furthermore, for \( \zeta < 0 \)

\[
|K_s(\theta, \zeta)| \leq (|\nu| + 1)^s|\theta|^s, \quad |L_s(\theta, \zeta)| \leq (|\nu| + 1)^s|\theta|^{s+1},
\]

(3.23)

and for \( \zeta > 0 \)

\[
|K_s(\theta, \zeta)| \leq (|\nu| + 1)^s|\theta|^s K_0(\theta, \zeta) \quad \text{and} \quad |L_s(\theta, \zeta)| \leq (|\nu| + 1)^s|\theta|^s |L_0(\theta, \zeta)|.
\]

(3.24)

This demonstrates the uniform convergence of the formal series in (3.5) for sufficiently large \( N \) and completes the proof of the lemma.

From the recursive formula (3.16)–(3.18), it can be readily shown that

\[
G_s(-\theta, \zeta) = (-1)^s G_s(\theta, \zeta) \quad \text{and} \quad H_s(-\theta, \zeta) = (-1)^{s-1} H_s(\theta, \zeta).
\]

(3.25)

Choosing \( \theta = \pm 1 \) in (3.2), we have

\[
\left( 1 \pm \frac{1}{N} \right)^{\frac{1}{2}} Z_\nu[(N \pm 1) \zeta^{\frac{1}{2}}] = Z_\nu(N\zeta^{\frac{1}{2}}) G \left( \zeta, \pm \frac{1}{N} \right) \pm \zeta^{\frac{1}{2}} Z_{\nu-1}(N\zeta^{\frac{1}{2}}) H \left( \zeta, \pm \frac{1}{N} \right),
\]

(3.26)

where

\[
G \left( \zeta, \pm \frac{1}{N} \right) := G(N; \pm 1, \zeta) := \sum_{s=0}^{\infty} (\pm 1)^s \frac{G_s(\zeta)}{N^s}.
\]

(3.27)
From the asymptotic relations (3.29), we have, respectively,

\[ G(N; \pm 1, \zeta) = \mp \zeta^+ K_\nu(N \zeta^+) L\left( \zeta, \pm \frac{1}{N} \right) + Z_{\nu-1}(N \zeta^+) K\left( \zeta, \pm \frac{1}{N} \right), \]

where

\[ L\left( \zeta, \pm \frac{1}{N} \right) := \pm L(N; \pm 1, \zeta) := \sum_{s=0}^{\infty} (\pm 1)^s \frac{L_s(\zeta)}{N^s}, \]

and

\[ K\left( \zeta, \pm \frac{1}{N} \right) := K(N; \pm 1, \zeta) := \sum_{s=0}^{\infty} (\pm 1)^s \frac{K_s(\zeta)}{N^s}. \]

By (3.16) and (3.21), we also have

\[ G_0(\zeta) = K_0(\zeta) = \cosh \xi^+ \]

and

\[ H_0(\zeta) = L_0(\zeta) = \frac{\sinh \sqrt{\zeta}}{\sqrt{\zeta}}. \]

Later in our discussion, we also need the values \( G(0, \frac{1}{N}), H(0, \frac{1}{N}), L(0, \frac{1}{N}) \) and \( K(0, \frac{1}{N}) \). To this end, we note that using (3.26) with \( Z_\nu = I_\nu \) and \( Z_\nu = e^{i\nu \pi} K_\nu \), we have, respectively,

\[ G\left( \zeta, \frac{1}{N} \right) = \left( 1 + \frac{1}{N} \right)^{\frac{\nu}{2}} \frac{I_\nu(N + 1) \zeta^+}{K_\nu(N \zeta^+)} + \frac{\nu}{2} \frac{K_{\nu-1}(N \zeta^+)}{K_\nu(N \zeta^+)} H\left( \zeta, \frac{1}{N} \right), \]

and

\[ H\left( \zeta, \frac{1}{N} \right) = \left( 1 + \frac{1}{N} \right)^{\frac{\nu}{2}} \frac{I_\nu(N + 1) \zeta^+}{\zeta^+ I_{\nu-1}(N \zeta^+)} - \frac{I_\nu(N \zeta^+)}{\zeta^+ I_{\nu-1}(N \zeta^+)} G\left( \zeta, \frac{1}{N} \right). \]

From the asymptotic relations

\[ I_\nu(z) \sim \left( \frac{z}{2} \right)^\nu \frac{1}{\Gamma(\nu + 1)} \quad \text{and} \quad K_\nu(z) \sim \frac{1}{2} \Gamma(\nu) \left( \frac{z}{2} \right)^{-\nu} \]

as \( z \to 0 \), it follows that

\[ G\left( 0, \frac{1}{N} \right) = \left( 1 + \frac{1}{N} \right)^{-\nu + \frac{1}{2}}, \]

\[ H\left( 0, \frac{1}{N} \right) = \frac{N}{2^\nu} \left[ \left( 1 + \frac{1}{N} \right)^{\nu + \frac{1}{2}} - \left( 1 + \frac{1}{N} \right)^{-\nu + \frac{1}{2}} \right]. \]
In a similar manner, we obtain

\begin{equation}
K \left(0, \frac{1}{N}\right) = \left(1 + \frac{1}{N}\right)^{-\frac{\nu}{2}},
\end{equation}

\begin{equation}
L \left(0, \frac{1}{N}\right) = \frac{N}{2(\nu - 1)} \left[\left(1 + \frac{1}{N}\right)^{-\frac{\nu}{2}} - \left(1 + \frac{1}{N}\right)^{-\nu + \frac{\nu}{2}}\right].
\end{equation}

### 4. Formal Asymptotic Solutions

Let \(\zeta(x)\) be an increasing function with \(\zeta(x_+)=0\). We try a formal series solution to (1.3) in the form

\begin{equation}
P_n(x) = N^{\frac{\nu}{2}} Z_{\nu}(N\zeta) \sum_{s=0}^{\infty} \frac{A_s(\zeta)}{N^s} + N^{\frac{\nu}{2}} \zeta Z_{\nu-1}(N\zeta) \sum_{s=0}^{\infty} \frac{B_s(\zeta)}{N^s};
\end{equation}

cf. (2.15). For convenience, we put

\begin{equation}
A \left(\zeta, \frac{1}{N}\right) := \sum_{s=0}^{\infty} \frac{A_s(\zeta)}{N^s}, \quad B \left(\zeta, \frac{1}{N}\right) := \sum_{s=0}^{\infty} \frac{B_s(\zeta)}{N^s}
\end{equation}

and

\begin{equation}
\Psi \left(x, \frac{1}{N}\right) := A_n x + B_n = \sum_{s=0}^{\infty} \frac{\alpha_s x + \beta_s'}{N^s};
\end{equation}

cf. (1.3) and (2.6). By Lemma 1, we have

\begin{equation}
P_{n+1}(x) = N^{\frac{\nu}{2}} Z_{\nu}(N\zeta) \left\{ G \left(\zeta, \frac{1}{N} + \frac{1}{N}\right) A \left(\zeta, \frac{1}{N} + \frac{1}{N}\right) \pm \zeta L \left(\zeta, \frac{1}{N} + \frac{1}{N}\right) B \left(\zeta, \frac{1}{N} + \frac{1}{N}\right) \right\}
\end{equation}

\begin{equation}
+ N^{\frac{\nu}{2}} \zeta Z_{\nu-1}(N\zeta) \left\{ K \left(\zeta, \frac{1}{N} + \frac{1}{N}\right) B \left(\zeta, \frac{1}{N} + \frac{1}{N}\right) \pm H \left(\zeta, \frac{1}{N} + \frac{1}{N}\right) A \left(\zeta, \frac{1}{N} + \frac{1}{N}\right) \right\}.
\end{equation}

Substituting (4.1) and (4.4) into the recurrence relation (1.3) and matching the coefficients of \(Z_{\nu}\) and \(Z_{\nu-1}\), we obtain

\begin{equation}
G \left(\zeta, \frac{1}{N}\right) A \left(\zeta, \frac{1}{N} + \frac{1}{N}\right) + G \left(\zeta, -\frac{1}{N}\right) A \left(\zeta, \frac{1}{N} - \frac{1}{N}\right) - \Psi \left(x, \frac{1}{N}\right) A \left(\zeta, \frac{1}{N}\right)
\end{equation}

\begin{equation}
+ \zeta L \left(\zeta, \frac{1}{N}\right) B \left(\zeta, \frac{1}{N} + \frac{1}{N}\right) - \zeta L \left(\zeta, -\frac{1}{N}\right) B \left(\zeta, \frac{1}{N} - \frac{1}{N}\right) = 0
\end{equation}

and

\begin{equation}
H \left(\zeta, \frac{1}{N}\right) A \left(\zeta, \frac{1}{N} + \frac{1}{N}\right) - H \left(\zeta, -\frac{1}{N}\right) A \left(\zeta, \frac{1}{N} - \frac{1}{N}\right) - \Psi \left(x, \frac{1}{N}\right) B \left(\zeta, \frac{1}{N}\right)
\end{equation}

\begin{equation}
+ K \left(\zeta, \frac{1}{N}\right) B \left(\zeta, \frac{1}{N} + \frac{1}{N}\right) + K \left(\zeta, -\frac{1}{N}\right) B \left(\zeta, \frac{1}{N} - \frac{1}{N}\right) = 0.
\end{equation}

By letting \(N \to \infty\), the last two equations give

\begin{equation}
G_0(\zeta) = K_0(\zeta) = \frac{\alpha_0 x + \beta_0'}{2}.
\end{equation}
Coupling (3.16) and (4.7) yields
\begin{equation}
\zeta^2 = \cosh^{-1}\left(\frac{\alpha_p x + \beta_p^2}{2}\right).
\end{equation}

Equating coefficients of like powers of $1/N$ in (4.5) and (4.6), we get
\begin{equation}
\sum_{2s \leq p} \left[ A_{p-2s} \sum_{i=0}^{2s} \left(\frac{2s - p}{2s - i}\right) G_i \right]
+ \sum_{2s+1 \leq p} \left[ B_{p-2s-1} \sum_{i=0}^{2s+1} \left(\frac{2s + 1 - p}{2s + 1 - i}\right) \zeta L_i \right] - \sum_{s \leq p} \frac{\alpha_p x + \beta_p^2}{2} A_{p-s} = 0
\end{equation}
and
\begin{equation}
\sum_{2s \leq p} \left[ B_{p-2s} \sum_{i=0}^{2s} \left(\frac{2s - p}{2s - i}\right) K_i \right]
+ \sum_{2s+1 \leq p} \left[ A_{p-2s-1} \sum_{i=0}^{2s+1} \left(\frac{2s + 1 - p}{2s + 1 - i}\right) H_i \right] - \sum_{s \leq p} \frac{\alpha_p x + \beta_p^2}{2} B_{p-s} = 0.
\end{equation}

From (4.9) and (4.10), it follows that
\begin{equation}
(p - 1) H_0 A_{p-1} = \sum_{1 \leq 2s \leq p} \left[ B_{p-2s} \sum_{i=0}^{2s} \left(\frac{2s - p}{2s - i}\right) K_i \right]
+ \sum_{2 \leq 2s+1 \leq p} \left[ A_{p-2s-1} \sum_{i=0}^{2s+1} \left(\frac{2s + 1 - p}{2s + 1 - i}\right) H_i \right] - \sum_{2 \leq s \leq p} \frac{\alpha_p x + \beta_p^2}{2} B_{p-s}
\end{equation}
and
\begin{equation}
(p - 1) \zeta L_0 B_{p-1} = \sum_{1 \leq 2s \leq p} \left[ A_{p-2s} \sum_{i=0}^{2s} \left(\frac{2s - p}{2s - i}\right) G_i \right]
+ \sum_{2 \leq 2s+1 \leq p} \left[ B_{p-2s-1} \sum_{i=0}^{2s+1} \left(\frac{2s + 1 - p}{2s + 1 - i}\right) \zeta L_i \right] - \sum_{2 \leq s \leq p} \frac{\alpha_p x + \beta_p^2}{2} A_{p-s},
\end{equation}
where we have made use of the fact that $H_1 = L_1 = 0$. Thus, for each $p \geq 1$, $A_p(\zeta)$ and $B_p(\zeta)$ can be determined successively from the above two equations for any given $A_0(\zeta)$ and $B_0(\zeta)$.

**Lemma 2.** Let $\zeta(x)$ be as in (4.8), and suppose $|A_0(\zeta)|$ and $(1 + |\zeta|^{1/2})|B_0(\zeta)|$ are bounded for $x \geq x_- + \delta$. Furthermore, let $A_s(\zeta)$ and $B_s(\zeta)$ be successively defined as in (4.11) and (4.12). Then there exists a positive constant $N_s$ independent of $x$ such that
\begin{equation}
|A_s(\zeta)| \leq N_s, \quad |B_s(\zeta)| \leq \frac{N_s}{(1 + |\zeta|^{1/2})}, \quad s = 1, 2, \ldots,
\end{equation}
for all $x \geq x_- + \delta, \ \delta > 0$. 

License or copyright restrictions may apply to redistribution; see http://www.ams.org/journal-terms-of-use
\begin{align} 
\text{Proof. Using (3.32) and (3.33), it can be shown that} \\
(4.14) \quad |G_0| &\leq C|H_0|(1 + |\zeta|^{1/2}) 
\end{align}
for \( x \geq x_+ + \delta \), where \( C \) is a positive constant. From (3.19), (3.20), (3.23) and (3.24), it also follows that there exists a constant \( C_s \), independent of \( x \), such that
\begin{align} 
(4.15) \quad |K_s| + |G_s| &\leq C_s|H_0|(1 + |\zeta|^{1/2}). 
\end{align}
Thus, if the functions \( A_p(\zeta) \) and \( B_p(\zeta) \) given successively in (4.11) and (4.12) are well-defined (i.e., \( B_p(\zeta) \) is bounded at \( \zeta = 0 \)), then the estimates in (4.13) can be readily verified by induction. To show that \( B_p(0) \) is bounded, we divide our discussion into three cases: (i) \( 2\nu \neq 0, 1, 2, \ldots \), (ii) \( 2\nu = 1, 2, 3, \ldots \), and (iii) \( 2\nu = 0 \).

In case (i), we first consider the second-order linear difference equation
\begin{align} 
(4.16) \quad y_{N+1} + y_{N-1} - \Psi \left(x_+, \frac{1}{N}\right) y_N = 0, 
\end{align}
where \( \Psi(x_+, 1/N) \) is given in (4.3). The results in [21] infer that (4.16) has two linearly independent asymptotic solutions of the form
\begin{align} 
(4.17) \quad y^{(1)}_N &\sim N^{-\nu + \frac{1}{2}} \sum_{s=0}^{\infty} c_s N^s, \\
y^{(2)}_N &\sim N^{\nu + \frac{1}{2}} \sum_{s=0}^{\infty} d_s N^s,
\end{align}
where \( c_0 = d_0 = 1 \),
\begin{align} 
(4.18) \quad c_1 &= \frac{\alpha_3 x_+ + \beta_3}{1 + 2\nu} \quad \text{and} \quad d_1 = \frac{\alpha_3 x_+ + \beta_3}{1 - 2\nu},
\end{align}
on account of (2.14). We shall show that for all \( p \geq 0 \),
\begin{align} 
(4.19) \quad A_p(0) &= c_p \quad \text{and} \quad B_p(0) = \frac{d_{p+1} - c_{p+1}}{2\nu}.
\end{align}
To this end, note that
\[ \alpha_3 x_+ + \beta_3 = \alpha_3 x_+ + \beta_3 + 2\tau_0(\alpha_2 x_+ + \beta_2). \]
Since \( 2\nu \neq 0, 1, 2, \ldots \) in this case, we can choose \( \tau_0 \) to be
\begin{align} 
(4.20) \quad \tau_0 &= -\frac{\alpha_3 x_+ + \beta_3}{2(\alpha_2 x_+ + \beta_2)} = -\frac{\alpha_3 x_+ + \beta_3}{2(\nu^2 - \frac{1}{4})},
\end{align}
so that \( B_0(0) = 0 \). Note that \( \nu \neq 1/2 \) in the present case and that the last equality follows from (2.14).

Returning to (4.5) and (4.6), we set \( \zeta = 0 \). This yields
\begin{align} 
(4.21) \quad G \left(0, \frac{1}{N}\right) A \left(0, \frac{1}{N+1}\right) + G \left(0, -\frac{1}{N}\right) A \left(0, \frac{1}{N-1}\right) - \Psi \left(x_+, \frac{1}{N}\right) A \left(0, \frac{1}{N}\right) = 0 \quad \text{and}
\end{align}
\begin{align} 
(4.22) \quad H \left(0, \frac{1}{N}\right) A \left(0, \frac{1}{N+1}\right) - H \left(0, -\frac{1}{N}\right) A \left(0, \frac{1}{N-1}\right) - \Psi \left(x_+, \frac{1}{N}\right) B \left(0, \frac{1}{N}\right) \\
+ K \left(0, \frac{1}{N}\right) B \left(0, \frac{1}{N+1}\right) + K \left(0, -\frac{1}{N}\right) B \left(0, \frac{1}{N-1}\right) = 0.
\end{align}
To see that (4.21) can be written in the form of (4.16), we put

\[ x_N := N^{-\nu + \frac{1}{2}}A \left( 0, \frac{1}{N} \right). \]

From (4.21) and (3.34), it is clear that \( x_N \) satisfies

\[ x_{N+1} + x_{N-1} - \Psi \left( x_+, \frac{1}{N} \right) x_N = 0 \]

and we have

\[ N^{-\nu + \frac{1}{2}}A \left( 0, \frac{1}{N} \right) = y_N^{(1)} \sim N^{-\nu + \frac{1}{2}} \sum_{s=0}^{\infty} \frac{c_s}{N^s} \]

on account of (4.17). This gives the first equation in (4.19). Analogously, we put

\[ \hat{x}_N = N^{\nu - \frac{1}{2}} \left[ NA \left( 0, \frac{1}{N} \right) + 2\nu B \left( 0, \frac{1}{N} \right) \right]. \]

Then, by using (3.35) and (3.36), it can be shown that \( \hat{x}_N \) satisfies (4.16) and

\[ N^{\nu - \frac{1}{2}} \left[ NA \left( 0, \frac{1}{N} \right) + 2\nu B \left( 0, \frac{1}{N} \right) \right] = y_N^{(2)} \sim N^{\nu + \frac{1}{2}} \sum_{s=0}^{\infty} \frac{d_s}{N^s}, \]

from which

\[ A_s(0) + 2\nu B_{s-1}(0) = d_s \]

follows and we obtain the second equation in (4.19).

In case (ii), i.e., \( 2\nu = 1, 2, \ldots \), the two linearly independent asymptotic solutions of (4.16) are

\[ y_N^{(1)} \sim N^{-\nu + \frac{1}{2}} \sum_{s=0}^{\infty} \frac{c_s}{N^s}, \quad y_N^{(2)} \sim N^{\nu + \frac{1}{2}} \sum_{s=0}^{\infty} \frac{d_s}{N^s} + Cy_N^{(1)} \log N, \]

where \( C \) is a constant; see Wong and Li [21]. In a similar manner, we have

\[ N^{-\nu + \frac{1}{2}}A \left( 0, \frac{1}{N} \right) = y_N^{(1)} \sim N^{-\nu + \frac{1}{2}} \sum_{s=0}^{\infty} \frac{c_s}{N^s} \]

and

\[ N^{\nu - \frac{1}{2}} \left[ NA \left( 0, \frac{1}{N} \right) + 2\nu B \left( 0, \frac{1}{N} \right) \right] = 0 \]

on account of (4.26). Coupling these together gives

\[ A_s(0) = c_s \quad \text{for } s = 0, 1, \ldots \]

and

\[ 2\nu B_s(0) = A_{s+1}(0) \quad \text{for } s = 0, 1, \ldots . \]

When \( \nu \neq 1/2 \), we can still choose \( \tau_0 \) as in (4.20) so that \( B_0(0) = 0 \). When \( \nu = 1/2 \), there is no singularity at \( \xi = 0 \) in (2.13), and the functions \( Z_{\nu} \) and \( Z_{\nu-1} \) in (4.1) can be expressed in terms of hyperbolic cosine and hyperbolic sine. So \( \nu = 1/2 \) is a simple case, and we can choose \( \tau_0 \) to be any real number.

In case (iii), \( \nu = 0 \) and the results in [21] infer that (4.16) has two linearly independent asymptotic solutions of the form

\[ y_N^{(1)} \sim N^{\frac{1}{2}} \sum_{s=0}^{\infty} \frac{c_s}{N^s}, \quad y_N^{(2)} \sim N^{\frac{1}{2}} \sum_{s=0}^{\infty} \frac{d_s}{N^s} + y_N^{(1)} \log N, \]
where \( c_0 = d_0 = 1 \) and \( c_1 = -d_1 = (\alpha'_x x_+ + \beta'_x) \). Similarly, we have
\[
N^\frac{1}{2} A_0 \left( 0, \frac{1}{N} \right) = y_N^{(1)} \sim N^\frac{1}{2} \sum_{s=0}^{\infty} \frac{c_s}{N^s}
\]
and
\[
N^{-\frac{1}{2}} \left( (N \log N) A_0 \left( 0, \frac{1}{N} \right) + B_0 \left( 0, \frac{1}{N} \right) \right) = y_N^{(2)} - y_N^{(1)} \sim N^{-\frac{1}{2}} \sum_{s=1}^{\infty} \frac{d_s - c_s}{N^s} + y_N^{(1)} \log N,
\]
from which it follows
\[
(4.30) \quad A_s(0) = c_s \quad \text{and} \quad B_s(0) = d_{s+1} - c_{s+1} \quad \text{for} \quad s = 0, 1, \ldots.
\]
In the case of \( \nu = 0 \), we can also choose \( \tau_0 \) as in (4.20) so that \( B_0(0) = 0 \). The proof of the lemma is now complete.

5. PROOF OF THE THEOREM

Since \( x \) is a fixed number in the recurrence relation (1.3), we may take
\[
Z_{\nu}(N \zeta^+) = H_0^{-\frac{1}{2}}(\zeta) I_{\nu}(N \zeta^+) \quad \text{and} \quad Z_{\nu}(N \zeta^+) = e^{i\tau \nu} H_0^{-\frac{1}{2}}(\zeta) K_{\nu}(N \zeta^+)
\]
in (4.1). In view of (3.33) and (4.8), we obtain two formal solutions
\[
P_n(x) = \left( \frac{4\zeta}{(\alpha'_0 x + \beta'_0)^2 - 4} \right)^\frac{1}{2} \left[ N^{\frac{1}{2}} I_{\nu}(N \zeta^+) \sum_{s=0}^{\infty} \frac{A_s(\zeta)}{N^s} \right.
\]
\[
+ N^{\frac{1}{2}} \zeta^+ I_{\nu-1}(N \zeta^+) \sum_{s=0}^{\infty} \frac{B_s(\zeta)}{N^s} \right]
\]
and
\[
Q_n(x) = \left( \frac{4\zeta}{(\alpha'_0 x + \beta'_0)^2 - 4} \right)^\frac{1}{2} \left[ N^{\frac{1}{2}} K_{\nu}(N \zeta^+) \sum_{s=0}^{\infty} \frac{A_s(\zeta)}{N^s} \right.
\]
\[
- N^{\frac{1}{2}} \zeta^+ K_{\nu-1}(N \zeta^+) \sum_{s=0}^{\infty} \frac{B_s(\zeta)}{N^s} \right].
\]
Here, \( I_{\nu} \) and \( K_{\nu} \) are the modified Bessel functions.

For convenience, we introduce the notations
\[
(5.3) \quad A_p \left( \zeta, \frac{1}{N} \right) := \sum_{s=0}^{p} \frac{A_s(\zeta)}{N^s}, \quad B_p \left( \zeta, \frac{1}{N} \right) := \sum_{s=0}^{p} \frac{B_s(\zeta)}{N^s},
\]
\[
r^p(x) := \left( \frac{4\zeta}{(\alpha'_0 x + \beta'_0)^2 - 4} \right)^\frac{1}{2} \left[ N^{\frac{1}{2}} I_{\nu}(N \zeta^+) A_p \left( \zeta, \frac{1}{N} \right) \right.
\]
\[
+ N^{\frac{1}{2}} \zeta^+ I_{\nu-1}(N \zeta^+) B_p \left( \zeta, \frac{1}{N} \right) \right]
\]
and
\[
s^p(x) := \left( \frac{4\zeta}{(\alpha'_0 x + \beta'_0)^2 - 4} \right)^\frac{1}{2} \left[ N^{\frac{1}{2}} K_{\nu}(N \zeta^+) A_p \left( \zeta, \frac{1}{N} \right) \right.
\]
\[
- N^{\frac{1}{2}} \zeta^+ K_{\nu-1}(N \zeta^+) B_p \left( \zeta, \frac{1}{N} \right) \right].
\]
Recall that the series obtained when we equated coefficients of $1$ and $A$ with $\alpha$ in (4.2) are formal solutions of (4.5) and (4.6). Since $A$ (5.6) terms with powers of $1$ using Lemma 2, it can be proved that there is a constant and $F$ with (5.7) where the nonhomogeneous term is given by (5.8)

$$R_p(x)/N^{p+\frac{1}{2}} = \left(\frac{4\zeta}{(\alpha_0 x + \beta_0)^2 - 4}\right)^{\frac{1}{2}} \left[ N^\frac{1}{2} I_\nu(N\zeta^\frac{1}{2}) F_{1,n}(x) \right] + N^\frac{1}{2} I_{\nu-1}(N\zeta^\frac{1}{2}) F_{2,n}(x) $$

with

$$F_{1,n}(x) = G\left(\zeta, \frac{1}{N}\right) A_p\left(\zeta, \frac{1}{N+1}\right) + G\left(\zeta, -\frac{1}{N}\right) A_p\left(\zeta, \frac{1}{N-1}\right) - \Psi\left(x, \frac{1}{N}\right) A_p\left(\zeta, \frac{1}{N}\right) + \zeta L\left(\zeta, \frac{1}{N}\right) B_p\left(\zeta, \frac{1}{N+1}\right)$$

$$- \zeta L\left(\zeta, -\frac{1}{N}\right) B_p\left(\zeta, \frac{1}{N-1}\right)$$

and

$$F_{2,n}(x) = H\left(\zeta, \frac{1}{N}\right) A_p\left(\zeta, \frac{1}{N+1}\right) - H\left(\zeta, -\frac{1}{N}\right) A_p\left(\zeta, \frac{1}{N-1}\right) - \Psi\left(x, \frac{1}{N}\right) B_p\left(\zeta, \frac{1}{N}\right) + K\left(\zeta, \frac{1}{N}\right) B_p\left(\zeta, \frac{1}{N+1}\right)$$

$$+ K\left(\zeta, \frac{1}{N}\right) B_p\left(\zeta, \frac{1}{N-1}\right).$$

Recall that the series

$$A\left(\zeta, \frac{1}{N}\right) = \sum_{s=0}^{\infty} \frac{A_s(\zeta)}{N^s} \quad \text{and} \quad B\left(\zeta, \frac{1}{N}\right) = \sum_{s=0}^{\infty} \frac{B_s(\zeta)}{N^s}$$

in (4.2) are formal solutions of (4.5) and (4.6). Since $A_p\left(\zeta, \frac{1}{N}\right)$ and $B_p\left(\zeta, \frac{1}{N}\right)$ can be written as

$$A_p\left(\zeta, \frac{1}{N}\right) = \sum_{s=0}^{\infty} \frac{A_s^p(\zeta)}{N^s} \quad \text{and} \quad B_p\left(\zeta, \frac{1}{N}\right) = \sum_{s=0}^{\infty} \frac{B_s^p(\zeta)}{N^s}$$

with $A_s^p(\zeta) = A_s(\zeta)$, $B_s^p(\zeta) = B_s(\zeta)$ for $s \leq p$ and $A_s^p(\zeta) = B_s^p(\zeta) = 0$ for $s \geq p + 1$, terms with powers of $1/N$ less than or equal to $p + 1$ in the expansions of $F_{1,n}(x)$ and $F_{2,n}(x)$ all vanish. (Note: The recurrence relations (4.11) and (4.12) were obtained when we equated coefficients of $1/N^p$ in (4.5) and (4.6) to zero.) Hence, using Lemma 2, it can be proved that there is a constant $C_p$ such that

$$|F_{1,n}(x)| \leq C_p(1 + |x|)/N^{p+2}$$

and

$$|F_{2,n}(x)| \leq C_p(1 + |x|)/N^{p+2}$$
for all \( x \geq x_- + \delta \). From (5.7), it follows that

\[
|R_n^p(x)| \leq \tilde{C}_p \left( \frac{4\zeta}{(\alpha_0^2 x + \beta_0^2)^2 - 4} \right)^{1/4} (1 + |x|) \left[ |I_\nu(N\zeta^2)| + \frac{||\zeta^2 + 1||}{1 + ||\zeta|} |K_{\nu-1}(N\zeta^2)| \right]
\]

for all \( x \geq x_- + \delta \) and for some positive constant \( \tilde{C}_p \). Similarly, we have

\[
s_{n+1}^p(x) - (A_n x + B_n) s_n^p(x) + s_{n-1}^p(x) = \frac{S_n^p(x)}{N^{n+2}},
\]

where

\[
|S_n^p(x)| \leq \tilde{C}_p \left( \frac{4\zeta}{(\alpha_0^2 x + \beta_0^2)^2 - 4} \right)^{1/4} (1 + |x|) \left[ |K_\nu(N\zeta^2)| + \frac{||\zeta|}{1 + ||\zeta^2|} |K_{\nu-1}(N\zeta^2)| \right].
\]

We now establish the existence of two solutions \( P_n(x) \) and \( Q_n(x) \) of (1.3) satisfying

\[
P_n(x) \sim r_n^0(x) \quad \text{and} \quad Q_n(x) \sim s_n^0(x)
\]
as \( n \to \infty \) for any fixed \( x > x_- \). It is easily verified that

\[
r_n^0(x) \sim \frac{1}{\sqrt{2\pi}} \left( \frac{4}{(\alpha_0^2 x + \beta_0^2)^2 - 4} \right)^{1/4} e^{N\zeta^2} (A_0 + \zeta B_0), \quad x > x_+,
\]

\[
r_n^0(x) \sim \frac{1}{\sqrt{2\pi}} \left( \frac{4}{(\alpha_0^2 x + \beta_0^2)^2 - 4} \right)^{1/4} e^{-N\zeta^2 + (\nu + \frac{1}{2})\pi i} (A_0 - \zeta B_0)
\]

\[
\quad + e^{N\zeta^2} (A_0 + \zeta B_0), \quad x_- + \delta \leq x < x_+,
\]

and

\[
s_n^0(x) \sim \frac{\sqrt{\pi}}{2} \left( \frac{4}{(\alpha_0^2 x + \beta_0^2)^2 - 4} \right)^{1/4} e^{-N\zeta^2} (A_0 - \zeta B_0), \quad x \geq x_- + \delta,
\]
as \( n \to \infty \). If \( P_n(x) \) and \( Q_n(x) \) are two linearly independent solutions of (1.3) satisfying (5.15), then it follows from (5.16), (5.17) and (5.18) that

\[
P_{n+1}(x)Q_n(x) - P_n(x)Q_{n+1}(x) = P_{n+2}(x)Q_{n+1}(x) - P_{n+1}(x)Q_{n+2}(x)
\]

and

\[
P_{n+1}(x)Q_n(x) - P_n(x)Q_{n+1}(x) = \lim_{m \to \infty} \left[ r_{m+1}^0(x)s_m^0(x) - r_m^0(x)s_{m+1}^0(x) \right]
\]

\[
= A_0^2 - \zeta B_0^2 \neq 0.
\]

Without loss of generality, we may assume \( A_0^2 - \zeta B_0^2 = 1 \). From this, it follows that there exists a smooth function \( \Gamma(\zeta) \) such that \( (1 + ||\zeta||)\Gamma(\zeta) \) is bounded for \( x \geq x_- + \delta \) and

\[
A_0 = \cosh \left( \sqrt{\zeta} \Gamma(\zeta) \right), \quad B_0 = \frac{\sinh \left( \sqrt{\zeta} \Gamma(\zeta) \right)}{\sqrt{\zeta}};
\]

see the assumption in Lemma 2. With these choices, we have

\[
P_{n+1}(x)Q_n(x) - P_n(x)Q_{n+1}(x) = 1.
\]
This, in particular, shows that $P_n(x)$ and $Q_n(x)$ are two linearly independent solutions.

Now define

$$
(5.21) \quad \varepsilon_n^p(x) := P_n(x) - r_n^p(x) \quad \text{and} \quad \delta_n^p(x) := Q_n(x) - s_n^p(x).
$$

We first show that the existence of $Q_n(x)$ to (1.3) satisfying (5.15) is equivalent to the existence of $\delta_n^p(x)$ to the summation formula

$$
(5.22) \quad \delta_n^p(x) = \sum_{j=n+1}^{\infty} \frac{[r_n^p(x)s_n^p(x) - s_n^p(x)r_n^p(x)]S_n^p(x)}{[r_{n+1}^p(x)s_n^p(x) - r_n^p(x)s_{n+1}^p(x)](j + \tau_0)^{p+\frac{x}{2}}}
$$

$$
+ \sum_{j=n+1}^{\infty} \frac{[r_n^p(x)S_n^p(x) - s_n^p(x)R_n^p(x)]\delta_n^p(x)}{[r_{n+1}^p(x)s_n^p(x) - r_n^p(x)s_{n+1}^p(x)](j + \tau_0)^{p+\frac{x}{2}}}.
$$

From (1.3) and (5.13), we obtain

$$
(5.23) \quad \delta_{n+1}^p(x) - (A_n x + B_n)\delta_n^p(x) + \delta_{n-1}^p(x) = -\frac{S_n^p(x)}{N^{p+\frac{x}{2}}}.
$$

Coupling (5.6) and (5.23) gives

$$
(5.24) \quad r_n^p(x)\delta_{n+1}^p(x) - r_{n+1}^p(x)\delta_n^p(x) = r_n^p(x)\delta_{n+2}^p(x) - r_{n+2}^p(x)\delta_{n+1}^p(x)
$$

$$
+ \frac{S_n^p(x)r_{n+1}^p(x) + R_{n+1}^p(x)\delta_{n+1}^p(x)}{(N + 1)^{p+\frac{x}{2}}}.
$$

In exactly the same manner, we also have

$$
(5.25) \quad s_n^p(x)\delta_{n+1}^p(x) - s_{n+1}^p(x)\delta_n^p(x) = s_n^p(x)\delta_{n+2}^p(x) - s_{n+2}^p(x)\delta_{n+1}^p(x)
$$

$$
+ \frac{S_n^p(x)s_{n+1}^p(x) + S_{n+1}^p(x)\delta_{n+1}^p(x)}{(N + 1)^{p+\frac{x}{2}}}.
$$

and

$$
(5.26) \quad r_{n+1}^p(x)s_n^p(x) - s_{n+1}^p(x)r_n^p(x) = r_{n+2}^p(x)s_{n+1}^p(x) - s_{n+2}^p(x)r_{n+1}^p(x)
$$

$$
+ \frac{S_{n+1}^p(x)r_{n+1}^p(x) - R_{n+1}^p(x)s_{n+1}^p(x)}{(N + 1)^{p+\frac{x}{2}}}.
$$

Repeated application of the last three equations yields, respectively,

$$
(5.27) \quad r_n^p(x)\delta_{n+1}^p(x) - r_{n+1}^p(x)\delta_n^p(x) = r_{n+1}^p(x)\delta_{m+2}^p(x) - r_{m+2}^p(x)\delta_{m+1}^p(x)
$$

$$
+ \sum_{j=n+1}^{m+1} \frac{R_j^p(x)\delta_j^p(x) + S_j^p(x)r_j^p(x)}{(j + \tau_0)^{p+\frac{x}{2}}},
$$

$$
(5.28) \quad s_n^p(x)\delta_{n+1}^p(x) - s_{n+1}^p(x)\delta_n^p(x) = s_{n+1}^p(x)\delta_{m+2}^p(x) - s_{m+2}^p(x)\delta_{m+1}^p(x)
$$

$$
+ \sum_{j=n+1}^{m+1} \frac{S_j^p(x)s_j^p(x) + S_j^p(x)\delta_j^p(x)}{(j + \tau_0)^{p+\frac{x}{2}}},
$$

and

$$
(5.29) \quad r_{n+1}^p(x)s_n^p(x) - s_{n+1}^p(x)r_n^p(x) = r_{m+2}^p(x)s_{m+1}^p(x) - s_{m+2}^p(x)r_{m+1}^p(x)
$$

$$
+ \sum_{j=n+1}^{m+1} \frac{S_j^p(x)r_j^p(x) - R_j^p(x)s_j^p(x)}{(j + \tau_0)^{p+\frac{x}{2}}}.
$$
If $Q_n(x)$ satisfies (5.15), then $\delta_n^0(x) = o(s_n^0(x))$ as $n \to \infty$. Since $\delta_n^p(x) = \delta_n^0(x) + s_n^0(x) - s_n^p(x)$ by (5.21), and since $A_s(\zeta)$ and $(1 + |\zeta|^\frac{1}{2})B_s(\zeta)$ are bounded for $s = 0, \ldots, p$ by Lemma 2, we also have $\delta_n^p(x) = o(s_n^0(x))$ as $n \to \infty$. In view of (5.16), (5.17) and (5.18), we have

\begin{align*}
(5.30) \quad r_{m+1}^p(x)\delta_{m+2}^p(x) - r_{m+2}^p(x)\delta_{m+1}^p(x) & \to 0, \\
(5.31) \quad s_{m+1}^p(x)\delta_{m+2}^p(x) - s_{m+2}^p(x)\delta_{m+1}^p(x) & \to 0
\end{align*}

and

\begin{align*}
(5.32) \quad r_{m+2}^p(x)s_{m+1}^p(x) - s_{m+2}^p(x)r_{m+1}^p(x) & \to 1
\end{align*}
as $m \to \infty$. By letting $m \to \infty$ in (5.27)–(5.29), we obtain

\begin{align*}
(5.33) \quad r_n^p(x)\delta_{n+1}^p(x) - r_{n+1}^p(x)\delta_n^p(x) &= \sum_{j=n+1}^{\infty} \frac{R_n^p(x)\delta_n^p(x) + S_n^p(x)r_n^p(x)}{(j + \tau_0)^{p+\frac{3}{2}}}, \\
(5.34) \quad s_n^p(x)\delta_{n+1}^p(x) - s_{n+1}^p(x)\delta_n^p(x) &= \sum_{j=n+1}^{\infty} \frac{S_n^p(x)s_n^p(x) + S_n^p(x)\delta_n^p(x)}{(j + \tau_0)^{p+\frac{3}{2}}}
\end{align*}

and

\begin{align*}
(5.35) \quad r_{n+1}^p(x)s_n^p(x) - s_{n+1}^p(x)r_n^p(x) = 1 + \sum_{j=n+1}^{\infty} \frac{S_n^p(x)r_n^p(x) - R_n^p(x)s_n^p(x)}{(j + \tau_0)^{p+\frac{3}{2}}}.
\end{align*}

Upon solving (5.33) and (5.34), we obtain (5.22). The existence of a solution \(\{\delta_n^p(x)\}_{n=1}^{\infty}\) to (5.22) is proved by using the successive approximation method. Starting with $\delta_{n,0}^p(x) = 0$, we define $\delta_{n,k}^p(x)$ by

\begin{align*}
(5.36) \quad \delta_{n,k}^p(x) = \sum_{j=n+1}^{\infty} \frac{[r_n^p(x)s_n^p(x) - s_n^p(x)r_n^p(x)]S_n^p(x)}{[r_{n+1}^p(x)s_{n+1}^p(x) - r_{n+1}^p(x)s_{n+1}^p(x)](j + \tau_0)^{p+\frac{3}{2}}} \\
&+ \sum_{j=n+1}^{\infty} \frac{[r_n^p(x)S_n^p(x) - s_n^p(x)R_n^p(x)]\delta_{n,k-1}^p(x)}{[r_{n+1}^p(x)s_{n+1}^p(x) - r_{n+1}^p(x)s_{n+1}^p(x)](j + \tau_0)^{p+\frac{3}{2}}}
\end{align*}

for $k \geq 1$. We shall show that for fixed $p$ and sufficiently large but also fixed $n$, the sequence \(\{\delta_{n,k}^p(x)\}_{k=0}^{\infty}\) is convergent as $k \to \infty$. Since $A_s(\zeta)$ and $(1 + |\zeta|^\frac{1}{2})B_s(\zeta)$ are bounded for $x \geq x_- + \delta$, it follows from (5.3)–(5.5) that

\begin{align*}
(5.37) \quad |r_n^p(x)| & \leq C N^\frac{3}{2} \left(\frac{4\zeta}{(\alpha_0x + \beta_0)^2 - 4}\right)^\frac{1}{2} \left|I_{\nu}(N\zeta^{\frac{1}{2}})\right| + \frac{\zeta^{\frac{1}{2}}}{1 + |\zeta^{\frac{1}{2}}|} \left|I_{\nu-1}(N\zeta^{\frac{1}{2}})\right|
\end{align*}

and

\begin{align*}
(5.38) \quad |s_n^p(x)| & \leq C N^\frac{3}{2} \left(\frac{4\zeta}{(\alpha_0x + \beta_0)^2 - 4}\right)^\frac{1}{2} \left[K_{\nu}(N\zeta^{\frac{1}{2}})\right] + \frac{\zeta^{\frac{1}{2}}}{1 + |\zeta^{\frac{1}{2}}|} \left[K_{\nu-1}(N\zeta^{\frac{1}{2}})\right]
\end{align*}

for some positive constant $C$. Furthermore, by virtue of the behaviors of $I_{\nu}$ and $K_{\nu}$, we have from (5.12) and (5.14)

\begin{align*}
(5.39) \quad |R_n^p(x)s_n^p(x)| & \leq M' N^\frac{3}{2} \left(\frac{1 + |\zeta^{\frac{1}{2}}|}{1 + N|\zeta^{\frac{1}{2}}|}\right) \leq M' N^\frac{3}{2}
\end{align*}

and

\begin{align*}
(5.40) \quad |S_n^p(x)r_n^p(x)| & \leq M' N^\frac{3}{2} \left(\frac{1 + |\zeta^{\frac{1}{2}}|}{1 + N|\zeta^{\frac{1}{2}}|}\right) \leq M' N^\frac{3}{2},
\end{align*}
where $M'$ is a positive constant. Thus, from (5.35) we obtain
\[ |r^p_{n+1}(x)s^p_n(x) - s^p_{n+1}(x)r^p_n(x) - 1| \leq \frac{2M'}{p} \cdot \frac{1}{Np}, \]
which in turn gives
\[
(5.41) \quad r^p_{n+1}(x)s^p_n(x) - s^p_{n+1}(x)r^p_n(x) > \frac{1}{2}
\]
for large $n$, say $n > 4M' - \tau_0$. A combination of (5.36), (5.37), (5.38) and (5.41) yields
\[
|\delta^p_{n,1}(x)| \leq 2 \sum_{j=n+1}^{\infty} \frac{|r^p_n(x)s^p_j(x)| + |s^p_n(x)r^p_j(x)||S^p_0(x)|}{(j + \tau_0)^{p+\frac{3}{2}}}
\leq M'' \left( \frac{4\zeta}{(\alpha_0 x + \beta_0^2)^2 - 4} \right)^{\frac{1}{2}} \left( \sum_{j=n+1}^{\infty} \frac{N^{\frac{3}{2}}}{(j + \tau_0)^{p+1}} \right) \left[ |K_{(N\zeta^\frac{1}{2})}| + |K_{(N\zeta^\frac{1}{2})}| \right]
\]
for some constant $M'' > 0$, where we have also used (5.40) and the monotonicity properties of $L_\nu$ and $K_\nu$. Hence
\[
(5.42) \quad |\delta^p_{n,1}(x)| \leq \frac{M''}{p} \cdot \frac{1}{N^{p-\frac{3}{2}}} \left( \frac{4\zeta}{(\alpha_0 x + \beta_0^2)^2 - 4} \right)^{\frac{1}{2}} \left[ |K_{(N\zeta^\frac{1}{2})}| + |K_{(N\zeta^\frac{1}{2})}| \right].
\]
Similarly, we can prove by induction that
\[
|\delta^p_{n,k}(x) - \delta^p_{n,k-1}(x)| \leq \left( \frac{M''}{p} \cdot \frac{1}{N^{p-\frac{3}{2}}} \right)^k \left( \frac{4\zeta}{(\alpha_0 x + \beta_0^2)^2 - 4} \right)^{\frac{1}{2}} N^{\frac{3}{2}} \left[ |K_{(N\zeta^\frac{1}{2})}| + |K_{(N\zeta^\frac{1}{2})}| \right],
\]
from which it also follows that
\[
(5.44) \quad \delta^p_{n,k}(x) = \sum_{m=1}^{k} [\delta^p_{n,m}(x) - \delta^p_{n,m-1}(x)]
\]
converges, as $k \to \infty$, for all $n \geq 2M'' - \tau_0$. Clearly, the limit function $\delta^p_n(x)$ satisfies (5.22). Thus, $Q_n(x) = s^p_n(x) + \delta^p_n(x)$ is a solution of (1.3) satisfying (5.15). Furthermore, we have from (5.42), (5.43) and (5.44) that
\[
|\delta^p_n(x)| \leq M'' \left( \frac{4\zeta}{(\alpha_0 x + \beta_0^2)^2 - 4} \right)^{\frac{1}{2}} \left[ |K_{(N\zeta^\frac{1}{2})}| + |K_{(N\zeta^\frac{1}{2})}| \right] / N^{p-\frac{3}{2}}.
\]
Note that $A_\nu(\zeta)$ and $(1 + |\zeta^\frac{1}{2}|)B_\nu(\zeta)$ are bounded for $x \geq x_- + \delta$. By taking an extra term in the expansion (5.5), we have
\[
|\delta^p_n(x)| \leq |\delta^p_{n+1}(x)| + M'' \left( \frac{4\zeta}{(\alpha_0 x + \beta_0^2)^2 - 4} \right)^{\frac{1}{2}} \left[ |K_{(N\zeta^\frac{1}{2})}| \frac{A_{p+1}(\zeta)}{N^{p+\frac{3}{2}}} \right] + |\zeta^\frac{1}{2} K_{(N\zeta^\frac{1}{2})}| \frac{B_{p+1}(\zeta)}{N^{p+\frac{3}{2}}} \right] + |\delta^p_{n+1}(x)| + |\delta^p_{n}(x)| \leq M'' \left( \frac{4\zeta}{(\alpha_0 x + \beta_0^2)^2 - 4} \right)^{\frac{1}{2}} \left[ |K_{(N\zeta^\frac{1}{2})}| + |K_{(N\zeta^\frac{1}{2})}| \right] / N^{p+\frac{3}{2}}.
\]
for some positive constants $M'_p$ and $M_p$, and (2.20) follows; see also (5.21).

The proof of (2.19) is very similar. As in (5.34), we have

$$Q_n(x)\varepsilon_{n+1}^p(x) - Q_{n+1}(x)\varepsilon_n^p(x) = \sum_{j=n+1}^{\infty} \frac{R_j^p(x)Q_j(x)}{(j + \tau_0)^{p + \frac{1}{2}}}.$$ 

Since $P_n(x)\varepsilon_{n+1}^p(x) - P_{n+1}(x)\varepsilon_n^p(x) = r_n^p(x)\varepsilon_{n+1}^p(x) - r_{n+1}^p(x)\varepsilon_n^p(x)$, it follows from (5.6) that

$$P_n(x)\varepsilon_{n+1}^p(x) - P_{n+1}(x)\varepsilon_n^p(x) = r_m^p(x)\varepsilon_{m+1}^p(x) - r_{m+1}^p(x)\varepsilon_m^p(x)$$

$$- \sum_{j=m+1}^{n} \frac{R_j^p(x)r_j^p(x) + R_j^p(x)\varepsilon_j^p(x)}{(j + \tau_0)^{p + \frac{1}{2}}},$$

where $n > m$; cf. (5.28). We may choose $m = \lfloor n/2 \rfloor$. Upon solving the last two equations, we get from (5.20)

$$\varepsilon_n^p(x) = [r_{n+1}^p(x)\varepsilon_m^p(x) - r_m^p(x)\varepsilon_{m+1}^p(x)]Q_n(x)$$

$$+ \sum_{j=n+1}^{\infty} \frac{[r_n^p(x) + \varepsilon_n^p(x)]R_j^p(x)Q_j(x)}{(j + \tau_0)^{p + \frac{1}{2}}}$$

$$+ \sum_{j=m+1}^{n} \frac{[R_j^p(x)r_j^p(x) + R_j^p(x)\varepsilon_j^p(x)]Q_n(x)}{(j + \tau_0)^{p + \frac{1}{2}}}.$$

The estimate

$$|\varepsilon_n^p(x)| \leq M_p \left( \frac{4\zeta}{(\alpha_0^2 + \beta_0^2)^2 - 4} \right)^{\frac{1}{2}} \left[ |I_\nu(N\zeta^\frac{1}{2})| + |I_{\nu-1}(N\zeta^\frac{1}{2})| \right]/N^{p + \frac{1}{2}}$$

is again proved by using the successive approximation method.

6. AN EXAMPLE

As an illustration, we consider monic polynomials $\pi_n(x)$ that are orthogonal on $[-1, 1]$ with respect to a modified Jacobi weight $w(x) = (1 - x)^{\alpha}(1 + x)^{\beta}h(x)$, where $\alpha, \beta > -1$ and $h$ is real analytic and strictly positive on $[-1, 1]$. These polynomials satisfy a three-term recurrence relation

$$\pi_{n+1}(x) = (x - b_n)\pi_n(x) - a_n^2\pi_{n-1}(x),$$

where the coefficients $a_n$ and $b_n$ have asymptotic expansions of the form

$$a_n \sim \frac{1}{2} + \sum_{k=2}^{\infty} \frac{C_k}{n^k},$$

$$b_n \sim \sum_{k=2}^{\infty} \frac{D_k}{n^k}.$$
The first few coefficients \(C_k\) and \(D_k\) are given by

\[
C_2 = -\frac{4\alpha^2 - 1}{32} \quad \text{and} \quad D_2 = -\frac{\beta^2}{4},
\]

\[
C_3 = \frac{4\alpha^2 - 1}{32} (\alpha + \beta + c_0) + \frac{4\beta^2 - 1}{32} (\alpha + \beta + d_0),
\]

\[
D_3 = -\frac{\beta^2 - \alpha^2}{4}(1 + \alpha + \beta) + c_0 \frac{4\alpha^2 - 1}{16} - d_0 \frac{4\beta^2 - 1}{16},
\]

where

\[
c_0 = \frac{1}{2\pi i} \int_{\gamma} \frac{\log h(t)}{\sqrt{t^2 - 1 - t}} dt,
\]

\[
d_0 = \frac{1}{2\pi i} \int_{\gamma} \frac{\log h(t)}{\sqrt{t^2 - 1 + t}} dt,
\]

and \(\gamma\) is a closed contour encircling the interval \([-1, 1]\) once in the positive direction; see Kuijlaars et al. [12], where an asymptotic expansion for the polynomials \(\pi_n(x)\) has also been given, which holds uniformly in compact subsets of \(\mathbb{C} \setminus [-1,1]\). Moreover, in another paper [13], Kuijlaars and Vanlessen have presented a uniform asymptotic expansion for \(\pi_n(x)\) in the interval \((-1 + \delta, 1 - \delta)\), which agrees with the one given by Szegö [17, p. 298, Theorem 12.1.6 and footnote 59]:

\[
\pi_n(x) = \frac{\sqrt{2} D_{\infty}}{2^n w^2(x)(1 - x^2)^{\frac{1}{2}}} \left[ \cos(n \arccos x + \gamma(x)) + o(1) \right],
\]

where

\[
D_{\infty} = \exp\left( \frac{1}{2\pi} \int_{-1}^{1} \frac{\log w(t)}{\sqrt{1 - t^2}} dt \right)
\]

and

\[
\gamma(x) = \frac{(1 - x^2)^{\frac{1}{2}}}{2\pi} \text{PV} \int_{-1}^{1} \frac{\log[\sqrt{1 - t^2} w(t)]}{\sqrt{1 - t^2}} dt - x.
\]

Here the integral is taken in the Cauchy principal-value sense. Note that the weight function \(w(x)\) satisfies the Szegö condition

\[
\int_{-1}^{1} \frac{\log w(x)}{\sqrt{1 - x^2}} dx > -\infty
\]

and that we have

\[
\lim_{n \to \infty} \frac{2^n \pi_n(z)}{\varphi^n(z)} = \frac{D_{\infty} \varphi^\frac{1}{2}(z)}{D(z) \sqrt{2(z^2 - 1)^{\frac{1}{2}}}},
\]

holding uniformly for \(z\) in compact subsets of \(\mathbb{C} \setminus [-1,1]\), where

\[
\varphi(z) = z + \sqrt{z^2 - 1}, \quad z \in \mathbb{C} \setminus [-1,1],
\]

and

\[
D(z) = \exp\left( -\frac{(z^2 - 1)^{\frac{1}{2}}}{2\pi} \int_{-1}^{1} \frac{\log w(t)}{\sqrt{1 - t^2}} dt - z \right).
\]
In (6.14) and (6.15), we take that branch of \((z^2 - 1)^{1/2}\) which is analytic in \(\mathbb{C} \setminus [-1, 1]\) and behaves like \(z\) as \(z \to \infty\). The function \(\varphi(z)\) in (6.14) is the familiar Joukowski or aerofoil map that maps the exterior of \([-1, 1]\) conformally onto the exterior of the unit ball, and the function \(D(z)\) is the so-called Szegő function associated with the weight \(w(x)\); see [17, p. 277].

Returning to the three-term recurrence relation (6.1), we let

\[
K_n = 2^{-n} \prod_{m=0}^{\infty} (2a_n + 2m+1)^{-2}.
\]

It can be readily verified that \(K_{n+1}/K_{n-1} = a_n^2\) and \(P_n(x) := \pi_n(x)/K_n\) satisfies the recurrence relation (1.3)

\[
P_{n+1}(x) - (A_n x + B_n)P_n(x) + P_{n-1} = 0
\]

with \(A_n = K_n/K_{n+1}\) and \(B_n = -b_n K_n/K_{n+1}\). From (6.2)–(6.7), it follows that the coefficients \(A_n\) and \(B_n\) satisfy

\[
A_n \sim 2 + \sum_{s=2}^{\infty} \frac{\alpha_s}{n^s} \quad \text{and} \quad B_n \sim \sum_{s=2}^{\infty} \frac{\beta_s}{n^s},
\]

where

\[
\alpha_2 = \frac{1}{4} (2\alpha^2 + 2\beta^2 - 1),
\]

\[
\alpha_3 = -\frac{4\alpha^2 - 1}{8} (\alpha + \beta + 1 + c_0) - \frac{4\beta^2 - 1}{8} (\alpha + \beta + 1 + d_0),
\]

\[
\beta_2 = \frac{\alpha^2 - \beta^2}{2}
\]

and

\[
\beta_3 = -\frac{4\alpha^2 - 1}{8} (\alpha + \beta + 1 + c_0) + \frac{4\beta^2 - 1}{8} (\alpha + \beta + 1 + d_0).
\]

In terms of the notation in (2.3), (2.14) and (4.20), we have

\(x_+ = 1, \quad x_- = -1, \quad \nu = \alpha\)

and

\(N = n + \tau_0 = n + \frac{\alpha + \beta + 1 + c_0}{2}\).

By our main theorem, there are two linearly independent solutions

\[
P_n(x) \sim \left(\frac{\zeta}{x^2 - 1}\right)^{1/2} \left[ N^\frac{\alpha}{2} I_\alpha(N\zeta^{1/2}) \sum_{s=0}^{\infty} \frac{A_s(\zeta)}{N^s} + N^\frac{\alpha+1}{2} \zeta^{1/2} I_{\alpha-1}(N\zeta^{1/2}) \sum_{s=0}^{\infty} \frac{B_s(\zeta)}{N^s} \right]
\]

and

\[
Q_n(x) \sim \left(\frac{\zeta}{x^2 - 1}\right)^{1/2} \left[ N^\frac{\alpha}{2} K_\alpha(N\zeta^{1/2}) \sum_{s=0}^{\infty} \frac{A_s(\zeta)}{N^s} - N^\frac{\alpha+1}{2} \zeta^{1/2} K_{\alpha-1}(N\zeta^{1/2}) \sum_{s=0}^{\infty} \frac{B_s(\zeta)}{N^s} \right]
\]

for \(x \geq -1 + \delta\), where

\[
\zeta^{1/2}(x) = \log \varphi(x) = \log(x + \sqrt{x^2 - 1})
\]
for \( x \geq 1 \) and
\[
\varsigma^{\frac{1}{2}}(x) = e^{\frac{x}{2}} \arccos x
\]
for \(-1 < x < 1\); see (4.8) and (6.14). Since \( \pi_n(x)/K_n \) is also a solution of (1.3), there exist two functions \( C_1(x) \) and \( C_2(x) \), which are independent of \( n \), such that
\[
\pi_n(x)/K_n = C_1(x)P_n(x) + C_2(x)Q_n(x).
\]
To determine these two functions, we first choose the function \( \Gamma(\zeta) \) in (5.19) as
\[
\Gamma(\zeta) = \left(\frac{z^2 - 1}{\zeta}\right)^{\frac{1}{2}} \frac{1}{4\pi i} \int_{\gamma} \frac{\log h(t)}{\sqrt{t^2 - 1}} \frac{dt}{t - z}, \quad z \in \mathbb{C} \setminus (-\infty, -1],
\]
where \( \zeta \) is the analytic function of \( z \) given in (6.33) and \( \gamma \) is a closed contour encircling the interval \([-1, 1]\) in the positive direction and also the given point \( z \). Obviously, \( \Gamma(\zeta) \) is analytic in \( z \in \mathbb{C} \setminus (-\infty, -1] \). From (6.12) and (6.26), it is clear that
\[
\Gamma(\zeta(x)) \arccos x = \gamma(x) + \frac{\alpha\pi}{2} + \frac{\pi}{4} - \frac{1}{2}(\alpha + \beta + 1 + c_0) \arccos x
\]
for \(-1 < x < 1\). From (5.17) and (5.18), we have
\[
P_n(x) \sim \sqrt{\frac{2}{\pi}}(1 - x^2)^{-\frac{1}{4}} e^{\alpha\pi i/2} \cos \left[(N + \Gamma(\zeta(x)) \arccos x - \frac{\alpha\pi}{2} - \frac{\pi}{4}\right]
\]
and
\[
Q_n(x) \sim \sqrt{\frac{\pi}{2}}(1 - x^2)^{-\frac{1}{4}} e^{-(\alpha+1)\pi i/2} \left\{ \cos \left[(N + \Gamma(\zeta(x)) \arccos x - \frac{\alpha\pi}{2} - \frac{\pi}{4}\right]
\right.
\]
\[
\left. - i \sin \left[(N + \Gamma(\zeta(x)) \arccos x - \frac{\alpha\pi}{2} - \frac{\pi}{4}\right]\right\}
\]
as \( n \to \infty \), for \(-1 < x < 1\). Letting \( n \to \infty \) in (6.25), it follows from (6.10) and (6.27) that
\[
\pi_n(x)/K_n \sim \sqrt{2} D_{\infty} w^{-\frac{1}{2}}(x)(1 - x^2)^{-\frac{1}{4}} \cos \left[(N + \Gamma(\zeta) \arccos x - \frac{\alpha\pi}{2} - \frac{\pi}{4}\right].
\]
A combination of (6.25), (6.28), (6.29) and (6.30) gives
\[
C_1(x) = \sqrt{\pi} D_{\infty} w^{-\frac{1}{2}}(x)e^{-\frac{\alpha\pi i}{2}} \quad \text{and} \quad C_2(x) = 0
\]
for \(-1 < x < 1\). Thus, we obtain
\[
\pi_n(x)/K_n = \sqrt{\pi} D_{\infty} (1 + x)^{-\frac{\alpha}{2}} h^{-\frac{\alpha}{2}}(x)\left[e^{-\frac{\alpha\pi i}{2}}(1 - x)^{-\frac{\pi}{2}} P_n(x)\right]
\]
for \(-1 < x < 1\). Note that \( e^{-\alpha\pi i/2}(1 - x)^{-\alpha/2} I_\alpha(N(-\zeta)^{1/2} i) \) can be written as \((x - 1)^{-\alpha/2} I_\alpha(N\zeta^{1/2})\), where
\[
\varsigma^{\frac{1}{2}}(z) := \log(z + \sqrt{z^2 - 1}), \quad z \in \mathbb{C} \setminus (-\infty, 1],
\]
and also note that all functions \((z - 1)^{-\alpha/2} I_\alpha(N\zeta^{1/2})\), \((z - 1)^{-\alpha/2} P_n(z)\) and \((z + 1)^{-\beta/2} h^{-1/2}(z)\) are analytic in \( z \in \mathbb{C} \setminus (-\infty, -1] \). By analytic continuation, we have from (6.32)
\[
\pi_n(z)/K_n = \sqrt{\pi} D_{\infty} (z + 1)^{-\frac{\alpha}{2}} h^{-\frac{\alpha}{2}}(z)\left[(z - 1)^{-\frac{\pi}{2}} P_n(z)\right]
\]
for \( z \in \mathbb{C} \setminus (-\infty,-1] \). In particular, when \( z = x = \cos \theta, \theta \in (0,\pi-\delta) \), we obtain the uniform asymptotic expansion

\[
(6.35) \quad w_2^{\frac{1}{2}}(\cos \theta) \left( \frac{\sin \theta}{\theta} \right)^{\frac{1}{2}} \pi_n(\cos \theta) \sim K_n \sqrt{\pi D_\infty} \left[ N^{\frac{1}{2}} J_\alpha(N\theta) \sum_{s=0}^{\infty} \frac{A_s(-\theta^2)}{N^s} - N^{\frac{1}{2}} \theta J_{\alpha-1}(N\theta) \sum_{s=0}^{\infty} \frac{B_s(-\theta^2)}{N^s} \right],
\]

where \( J_\alpha \) is the Bessel function of first kind.
