ASYMPTOTIC DISTRIBUTIONS OF THE ZEROS
OF CERTAIN CLASSES OF HYPERGEOMETRIC FUNCTIONS
AND POLYNOMIALS

H. M. SRIVASTAVA, JIAN-RONG ZHOU, AND ZHI-GANG WANG

Abstract. The main object of this paper is to consider the asymptotic
distribution of the zeros of certain classes of the Clausenian hypergeometric
$3F_2$ functions and polynomials. Some classical analytic methods and tech-
niques are used here to analyze the behavior of the zeros of the Clausenian
hypergeometric polynomials:

$$3F_2(-n, \tau n + a, b; \tau n + c, -n + d; z),$$

where $n$ is a nonnegative integer. Some families of the hypergeometric $3F_2$
functions, which are connected (by means of a hypergeometric reduction
formula) with the Gauss hypergeometric polynomials of the form

$$2F_1(-n, kn + l + 1; kn + l + 2; z),$$

are also investigated. Numerical evidence and graphical illustrations of the
clustering of zeros on certain curves are generated by Mathematica (Version
4.0).

1. Introduction

A generalized hypergeometric $pF_q$ function with $p$ numerator parameters
$\alpha_1, \ldots, \alpha_p$ and $q$ denominator parameters $\beta_1, \ldots, \beta_q$ is defined by (see, for details,
[1] and [17])

$$pF_q \left[ \begin{array}{c}
\alpha_1, \ldots, \alpha_p; \\
\beta_1, \ldots, \beta_q;
\end{array} \right] z = \sum_{k=0}^{\infty} \frac{(\alpha_1)_k \cdots (\alpha_p)_k}{(\beta_1)_k \cdots (\beta_q)_k} \frac{z^k}{k!}$$

$$\left( p, q \in \mathbb{N}_0; p \leq q + 1; p \leq q \quad \text{and} \quad |z| < \infty; p = q + 1 \quad \text{and} \quad |z| < 1, \right)$$

provided that no zeros appear in the denominator. Here, and in what follows,

$$\mathbb{N}_0 := \{0, 1, 2, \ldots\} = \mathbb{N} \cup \{0\} \quad (\mathbb{N} := \{1, 2, 3, \ldots\})$$

1770 H. M. SRIVASTAVA, JIAN-RONG ZHOU, AND ZHI-GANG WANG

and \((\lambda)\)\(_\nu\) denotes the Pochhammer symbol (or the shifted factorial, since \((1)\)_n = n! for \(n \in \mathbb{N}\)) defined, in terms of the familiar Gamma functions, by

\[
(1.2) \quad (\lambda)\_\nu := \frac{\Gamma(\lambda + \nu)}{\Gamma(\lambda)} = \begin{cases} 
1 & (\nu = 0; \ \lambda \in \mathbb{C} \setminus \{0\}) \\
\lambda(\lambda+1)\cdots(\lambda+n-1) & (\nu = n \in \mathbb{N}; \ \lambda \in \mathbb{C}),
\end{cases}
\]

\(\mathbb{C}\) being the set of complex numbers.

If one of the numerator parameters \(\alpha_1, \cdots, \alpha_p\) is equal to a negative integer or zero, say

\[\alpha_1 = -n \quad (n \in \mathbb{N}_0),\]

then the series terminates and reduces to a polynomial of degree \(n\) in \(z\). The natural question that arises in connection with any polynomials is the correlative properties of its zeros (see, for example, [3, 9, 11, 21]).

The hypergeometric polynomials whose properties are best known and understood, including the location of their zeros and their asymptotic zero distribution, are those in the \(_1F_1\) (Kummer and Whittaker) and \(_2F_1\) (Gauss) classes (see, for details, [20]), mainly because of their connection with orthogonal polynomials [13]. In particular, in the case of the Gauss hypergeometric \(_2F_1\) polynomials, their connection with the classical Jacobi polynomials \(P_n^{(\alpha,\beta)}(z)\) given by (see [19, p. 62] and [18, p. 35])

\[
(1.3) \quad P_n^{(\alpha,\beta)}(z) = (-1)^n P_n^{(\beta,\alpha)}(-z) = \binom{\alpha + n}{n} \binom{-n, \alpha + \beta + n + 1; \alpha + 1; \frac{1}{2}}{2},
\]

has led to a great deal of significant information about their zeros. For the \(_3F_2\) polynomials, however, there is no connection (in general) with the classical orthogonal polynomials, and the knowledge of the location of their zeros is restricted to some rather special polynomial classes (see, for example, [4, 5, 7, 8, 15]; see also [18] pp. 140 and 183 for the Clausenian hypergeometric \(_3F_2\) representations of the Rice polynomials and the Pasternack polynomials, respectively).

In the present paper, we propose to derive the asymptotic results for the zeros of the following general family of hypergeometric \(_3F_2\) polynomials (see also Section 2 and [6] for some of the various known or new special cases):

\[\_3F_2(-n, \tau n + a; b; \tau n + c, -n + d; z)\]

\((b \in \mathbb{C} \setminus \mathbb{Z}^-; d \in \mathbb{C} \setminus \mathbb{N}_0; \ \tau \neq 0; \ \tau n + a \neq 0, -1, \cdots, -n; \ \tau n + c \neq 0, -1, \cdots, -n),\]

where

\[\mathbb{Z}^- = \{0, -1, -2, \cdots\} = \mathbb{Z}^- \cup \{0\}.\]

We also consider the asymptotic behavior of the zeros of the following Clausenian hypergeometric function:

\[\_3F_2\left[ \binom{(k + \frac{1}{2}) n + l + \frac{1}{2}, (k + \frac{1}{2}) n + l + 1, kn + l;}{(2k + 1)n + 2l + 1, kn + l + 1; 1 - z^2}. \right] \]

Numerical evidence and graphical illustrations of the clustering of the zeros on certain curves are generated by Mathematica (Version 4.0).
2. A set of main results

For notational simplicity, we write

\[
\binom{-n, \tau n + a, b;}{\tau n + c, -n + d; z} =: \sum_{k=0}^{n} a_{n,k} z^k \quad (a_{n,0} := 1).
\]

Lemma 1. Let

\[b \in \mathbb{C} \setminus \mathbb{Z}_0^-, \quad d \in \mathbb{C} \setminus \mathbb{N}_0, \quad \tau \neq 0, \quad \tau n + a \neq 0, -1, \ldots, -n \quad \text{and} \quad \tau n + c \neq 0, -1, \ldots, -n.\]

Then each of the following inequalities holds true:

\[
|a_{n,k}| \leq \mathfrak{M}_0 \cdot (k + 1)^{|d| + 2|a - c| + |1 - b|} \quad (0 \leq k \leq n; \quad n, k \in \mathbb{N}_0),
\]

where the constant \(\mathfrak{M}_0 > 0\) depends on the parameters \(a, b, c\) and \(d\), but not on \(n\) and \(k\);

\[
\left|\frac{a_{n,n-k}}{a_{n,n}}\right| \leq \widetilde{\mathfrak{M}_0} \cdot (k + 2)^{|d| + 2|c-a| + |1-b|} \quad (0 \leq k \leq n; \quad n, k \in \mathbb{N}_0),
\]

where the constant \(\widetilde{\mathfrak{M}_0} > 0\) depends on the parameters \(a, b, c\) and \(d\), but not on \(n\) and \(k\).

Proof. We first consider the case when \(0 < k < n\) \((n, k \in \mathbb{N})\). Then, according to the following identity for the Pochhammer symbol \((\lambda)_n\) defined by (1.2):

\[
(-n)_j =: \begin{cases} 
\frac{(-1)^j n!}{(n-j)!} & (0 \leq j \leq n; \quad n, j \in \mathbb{N}_0) \\
0 & (j \geq n + 1; \quad n \in \mathbb{N}_0; \quad j \in \mathbb{N}).
\end{cases}
\]

we have

\[
\frac{a_{n,k+1}}{a_{n,k}} = \frac{(n-k)(\tau n + a + k)(b + k)}{(n-d-k)(\tau n + c + k)(k + 1)}.
\]

We also observe that

\[
\frac{n-k}{n-d-k} = 1 + \frac{d}{n-d-k},
\]

\[
\frac{\tau n + a + k}{\tau n + c + k} = 1 + \frac{a-c}{\tau n + c + k}
\]

and

\[
\frac{b+k}{k+1} = 1 + \frac{b-1}{k+1},
\]

so that

\[
\ln \left(\frac{n-k}{n-d-k}\right) \leq \frac{|d|}{|n-d-k|},
\]

\[
\ln \left(\frac{\tau n + a + k}{\tau n + c + k}\right) \leq \frac{|a-c|}{|\tau n + c + k|}
\]

and

\[
\ln \left(\frac{b+k}{k+1}\right) \leq \frac{|b-1|}{k+1},
\]
respectively. Hence, we have
\[
\ln |a_{n,k}| = \ln \left( \prod_{l=0}^{k-1} \frac{|a_{n,l+1}|}{|a_{n,l}|} \right) = \sum_{l=0}^{k-1} \ln \frac{|a_{n,l+1}|}{|a_{n,l}|} \\
\leq \sum_{l=0}^{k-1} \left( \frac{|d|}{|n-d-l|} + \frac{|a-c|}{|\tau n + c + l|} + \frac{|b-1|}{l+1} \right) \\
\leq \sum_{l=0}^{k-1} \left( \frac{|d|}{|n-d-k+l+1|} + \frac{2|a-c|}{l+1} + \frac{|b-1|}{l+1} \right) \quad (n \text{ sufficiently large}) \\
\leq 2M + (|d| + 2|a-c| + |b-1|) \ln(k+1) + \gamma, \tag{2.6}
\]
where \( M > 0 \) is a constant and \( \gamma \) is the Euler-Mascheroni constant given by
\[
\gamma := \lim_{n \to \infty} \left( \sum_{k=1}^{n} \frac{1}{k} - \ln n \right) \approx 0.577215664901532860606512 \cdots.
\]

It follows from (2.6) that
\[
|a_{n,k}| \leq 2M_0 \cdot (k+1)^{|d|+2|a-c|+|1-b|} \quad (0 < k < n; n, k \in \mathbb{N}),
\]
where the constant \( M_0 > 0 \) depends on the parameters \( a, b, c \) and \( d \), but not on \( n \) and \( k \). The cases of the assertion (2.2) of Lemma 1 when \( k = 0 \) and \( k = n \) are trivial.

Next, by replacing \( k \) by \( n-k \) in (2.5), we have
\[
ad_{n,n-k} \quad a_{n,k+1} = \frac{[(\tau+1)n+c-k](k-d)(n-k+1)}{[(\tau+1)n+a-k]k(b+n-k)}.
\]

Since
\[
\frac{k-d}{k} = 1 - \frac{d}{k}, \quad \frac{(\tau+1)n+c-k}{(\tau+1)n+a-k} = 1 + \frac{c-a}{(\tau+1)n+a-k}
\]
and
\[
\frac{n-k+1}{b+n-k} = 1 + \frac{1-b}{b+n-k},
\]
it follows that
\[
\ln \left( \frac{|k-d|}{k} \right) \leq \frac{|d|}{k},
\]
\[
\ln \left( \frac{|(\tau+1)n+c-k|}{|(\tau+1)n+a-k|} \right) \leq \frac{|c-a|}{|(\tau+1)n+a-k|}
\]
and
\[
\ln \left( \frac{1+n-k}{|b+n-k|} \right) \leq \frac{|1-b|}{|b+n-k|}.
\]
respectively. Therefore, we obtain
\[
\ln \left( \frac{|a_{n,n-k}|}{|a_{n,n}|} \right) = \ln \left( \prod_{l=1}^{k} \frac{|a_{n,n-l}|}{a_{n,n-l+1}|} \right) = \sum_{l=1}^{k} \ln \left( \frac{|a_{n,n-l}|}{a_{n,n-l+1}|} \right) \\
\leq \sum_{l=1}^{k} \left( \frac{|d|}{l} + \frac{|c-a|}{|\tau + 1|n + a - l|} + \frac{|1-b|}{|b + n - k - 1 + l|} \right) \\
\leq \sum_{l=1}^{k} \left( \frac{|d| + 2|c-a|}{l} + \frac{|1-b|}{|b + n - k - 1 + l|} \right) \quad (n \text{ sufficiently large}) \\
\leq \gamma + (|d| + 2|c-a| + |1-b|) \ln(k + 2) + \gamma, 
\]
where \( \gamma > 0 \) is a constant and \( \gamma \) is the Euler-Mascheroni constant given by (2.7). Consequently, it follows from (2.8) that
\[
\frac{|a_{n,n-k}|}{|a_{n,n}|} \leq \gamma (k + 2)^{|d| + 2|c-a| + |1-b|}, 
\]
where the constant \( \gamma > 0 \) depends on the parameters \( a, b, c \) and \( d \), but not on \( n \) and \( k \).

Finally, since the cases of the assertion (2.3) of Lemma 1 when \( k = 0 \) and \( k = n \) are immediate, our proof of Lemma 1 is completed.

**Theorem 1.** For fixed parameters \( a, b, c, d \) and \( \tau \) constrained by \( b \in \mathbb{C} \setminus \mathbb{Z}^{-}, \quad d \in \mathbb{C} \setminus \mathbb{N}, \quad \tau \neq 0, \quad \tau n + a \neq 0, -1, \ldots, -n \) and \( \tau n + c \neq 0, -1, \ldots, -n \), the zeros of the Clausenian hypergeometric polynomials:
\[
_{3}F_{2} \left[ \begin{array}{c} -n, \tau n + a, b; \\ \tau n + c, -n + d; \end{array} \right] z
\]
approach the unit circle as \( n \to \infty \).

**Proof.** From the assertion (2.2) of Lemma 1, it immediately follows that the following sequence of polynomials:
\[
\sum_{k=0}^{n} a_{n,k} z^k
\]
is uniformly bounded on the disk \( \Omega \) given by
\[
\Omega = \{ z : z \in \mathbb{C} \quad \text{and} \quad |z| < \rho \quad (0 < \rho < 1) \}.
\]
Furthermore, since (for fixed \( k \))
\[
a_{n,k} = \frac{(-n)_{k}(\tau n + a)_{k}(b)_{k}}{(\tau n + c)_{k}(-n + d)_{k}(1)_{k}} \to \frac{b)_{k}}{(1)_{k}} \quad (n \to \infty),
\]
the following sequence of functions:
\[
\left\{ \sum_{k=0}^{n} a_{n,k} z^k \right\}_{n \in \mathbb{N}_0}
\]
converges pointwise and, therefore, also uniformly, by Vitali’s theorem \[12\] p. 252, to
\[
\sum_{k=0}^{\infty} \frac{(b)_k z^k}{(1)_k} = \sum_{k=0}^{\infty} a_{n,k} z^k = \frac{2}{\mathcal{F}_1\left[\begin{array}{c} b, 1; \\ 1; \\
\end{array} \right]} = (1 - z)^{-b}.
\]
Since the function \((1 - z)^{-b}\) does not have any zeros inside the unit disk, by Hurwitz’s theorem \[12\] p. 205, there exists an index \(N_0\) such that
\[
\sum_{k=0}^{n} a_{n,k} z^k
\]
does not have zeros on \(\Omega\) for \(n > N_0\). Hence there exist numbers \(\rho_n\) constrained by
\[
0 < \rho_n < 1
\]
such that \(\rho_n \to 1\), and we can ensure that
\[
\rho_n \geq \rho \quad (n > N_0; 0 < \rho < 1).
\]
Next, from the assertion (2.3) of Lemma 1, it also follows that the sequence of polynomials:
\[
\frac{z^n}{a_{n,n}} \sum_{k=0}^{n} a_{n,k} \left(\frac{1}{z}\right)^k = \frac{z^n}{a_{n,n}} \sum_{k=0}^{n} a_{n,n-k} z^k
\]
is uniformly bounded on \(\Omega\). Moreover, since (for fixed \(k\))
\[
\frac{a_{n,n-k}}{a_{n,n}} = \frac{(-1)^k \Gamma(d) \Gamma(n+1) \Gamma((\tau+1)n+a-k) \Gamma(n+b-k) \Gamma(2n+c)}{k! \Gamma(d-k) \Gamma(n+b) \Gamma((\tau+1)n+c-k) \Gamma(n-k+1) \Gamma(2n+a)}
\]
\[
\to \frac{(1 - d)_k}{(1)_k} \quad (n \to \infty),
\]
the following sequence of functions:
\[
\left\{ \sum_{k=0}^{n} \frac{a_{n,n-k} z^k}{a_{n,n}} \right\}_{n \in \mathbb{N}_0}
\]
converges pointwise, and therefore uniformly, by Vitali’s theorem \[12\] p. 252, to
\[
\sum_{k=0}^{\infty} \frac{(1 - d)_k z^k}{(1)_k} = \sum_{k=0}^{\infty} a_{n,k} \left(\frac{1}{z}\right)^k = \frac{2}{\mathcal{F}_1\left[\begin{array}{c} 1-d, 1; \\ 1; \\
\end{array} \right]} = (1 - z)^{d-1}.
\]
Since the function \((1 - z)^{d-1}\) does not have any zeros inside the unit disk, by Hurwitz’s theorem \[12\] p. 205, there exists an index \(N_0\) such that
\[
\sum_{k=0}^{n} a_{n,n-k} z^k
\]
does not have zeros on \(\Omega\) for \(n > N_0\); that is,
\[
\sum_{k=0}^{n} a_{n,k} z^k
\]
does not have zeros \(|z| > \frac{1}{\rho}\). Hence there exist numbers \(\gamma_n\) constrained by
\[
\gamma_n > 1
\]
such that \(\gamma_n \to 1\),
and we can ensure that
\[ \gamma_n \leq \frac{1}{\rho} \quad (n > N_0; \ 0 < \rho < 1). \]
Consequently, all zeros of the polynomial:
\[ \sum_{k=0}^{n} a_{n,k} z^k \]
lie in the annulus given by
\[ \{ z : z \in \mathbb{C} \text{ and } \rho_n \leq |z| \leq \gamma_n \}, \]
which completes the proof of Theorem 1. \( \square \)

Upon setting
\[ a = 1, \ b = \frac{1}{2}, \ c = t + 1, \ d = 1 - t \quad \text{and} \quad \tau = 1 \]
in Theorem 1, we can deduce the following corollary.

**Corollary 1** ([6, Theorem 2.2]). For fixed \( t > 0 \), the zeros of the following Clausenian hypergeometric polynomials:
\[ 3F_2 \left[ \begin{array}{c} -n, n+1, \frac{1}{2}; \\ n+t+1, -n+1-t; \end{array} \right] \]
approach the unit circle as \( n \to \infty \).

If, on the other hand, we choose
\[ a = -t, \ b = t, \ c = 0, \ d = \frac{1}{2} \quad \text{and} \quad \tau = -2 \]
in Theorem 1, we obtain the following result.

**Corollary 2.** For fixed \( t > 0 \), the zeros of the following Clausenian hypergeometric polynomials:
\[ 3F_2 \left[ \begin{array}{c} -n, -2n - t, t; \\ -2n, -n + \frac{1}{2}; \end{array} \right] \]
approach the unit circle \( |z| = 1 \) as \( n \to \infty \).

**Remark 1.** Corollary 2 provides an alternative form of a known result [10, Proposition 4.4].

**Theorem 2.** Let
\[ \tau n + a \neq 0, -1, \cdots, -n \quad \text{and} \quad \tau n + c \neq 0, -1, \cdots, -n. \]
If the fixed parameters \( a, b, c, d \) and \( \tau \) are constrained by
\[ a \leq c, \ 0 < b \leq 1, \ d \leq 0 \quad \text{and} \quad \tau > 0 \]
or by
\[ a \geq c, \ 0 < b \leq 1, \ d \leq 0 \quad \text{and} \quad \tau < -1, \]
then the zeros of the following Clausenian hypergeometric polynomials:
\[ 3F_2 \left[ \begin{array}{c} -n, \tau n + a, b; \\ \tau n + c, -n + d; \end{array} \right] \]
lie outside the unit disk \( |z| \leq 1 \) and approach the unit circle \( |z| = 1 \) as \( n \to \infty \).

The proof is based on the following classical theorem [14] p. 136.

**Lemma 2** (Eneström-Kakeya Theorem [14] p. 136). If

\[
0 < a_0 < a_1 < \cdots < a_n,
\]

then all zeros of the polynomial:

\[
p(z) = a_0 + a_1 z + \cdots + a_n z^n
\]

lie in the unit disk \( |z| \leq 1 \).

**Proof of Theorem 2.** According to Theorem 1, we only need to prove that the zeros of the Clausenian hypergeometric polynomials:

\[
_{3}F_{2}(-n, n + a, b; n + c, -n + d; z)
\]

lie outside the unit circle \( |z| = 1 \). We also find from (2.1) that

\[
z^n_{3}F_{2}\left[ \begin{array}{c} -n, \tau n + a, b; \\
\tau n + c, -n + d;
\end{array} \right] = \sum_{k=0}^{n} a_{n,k} z^{n-k} = \sum_{k=0}^{n} a_{n,n-k} z^k.
\]

Thus, under the parametric constraints:

\[
a \leq c, \quad 0 < b \leq 1, \quad d \leq 0 \quad \text{and} \quad \tau > 0
\]

or

\[
a \geq c, \quad 0 < b \leq 1, \quad d \leq 0 \quad \text{and} \quad \tau < -1,
\]

which are already mentioned in the hypothesis of Theorem 2, we find from (2.5) (for sufficiently large \( n \)) that

\[
a_{n,n-(k+1)} a_{n,n-k} = \frac{(k + 1 - d)(\tau + 1)n + c - k - 1)(n - k)}{(k + 1)(\tau + 1)n + a - k - 1)(b + n - k - 1)} > 1 \quad (k = 0, 1, \cdots, n - 1),
\]

which implies that the coefficients of the polynomial:

\[
\tilde{F}(z) := z^n_{3}F_{2}(-n, \tau n + a, b; \tau n + c, -n + d; z^{-1}) = \sum_{k=0}^{n} a_{n,n-k} z^k
\]

are positive and increasing:

\[
0 < a_{n,n} < a_{n,n-1} < \cdots < a_{n,0}.
\]

It follows from Lemma 2 that the zeros of the polynomial \( \tilde{F}(z) \) defined by (2.11) lie in the unit disk \( |z| \leq 1 \). Hence the zeros of

\[
_{3}F_{2}(-n, \tau n + a, b; \tau n + c, -n + d; z)
\]

lie outside the unit disk \( |z| \leq 1 \). This completes our proof of Theorem 2. \( \square \)

**Theorem 3.** Let

\[
\tau n + a \neq 0, -1, \cdots, -n \quad \text{and} \quad \tau n + c \neq 0, -1, -2, \cdots, -n.
\]

If the fixed parameters \( a, b, c, d \) and \( \tau \) are constrained by

\[
a \geq c, \quad b \geq 1, \quad 0 \leq d < 1 \quad \text{and} \quad \tau > 0
\]

or by

\[
a \leq c, \quad b \geq 1, \quad 0 \leq d < 1 \quad \text{and} \quad \tau < -1,
\]

License or copyright restrictions may apply to redistribution; see http://www.ams.org/journal-terms-of-use
then the zeros of the following Clausenian hypergeometric polynomials:

\[ 3F_2 \left[ \begin{array}{c}
-n, \tau_n + a, b; \\
\tau_n + c, -n + d;
\end{array} \vphantom{\begin{array}{c}
\tau_n + a, b; \\
\tau_n + c, -n + d;
\end{array}} \right] \]

lie inside the unit disk \(|z| \leq 1\) and approach the unit circle as \(n \to \infty\).

**Proof.** By appealing appropriately to Theorem 1, we only need to prove that the zeros of

\[ 3F_2(-n, n + a, b; n + c, -n + d; z) \]

lie inside the unit disk \(|z| \leq 1\). Thus, under the parametric constraints:

- \(a \geq c, \ b \geq 1, \ 0 \leq d < 1\) and \(\tau > 0\)
- or
- \(a \leq c, \ b \geq 1, \ 0 \leq d < 1\) and \(\tau < -1\),

which are already mentioned in the hypothesis of Theorem 2, we find from (2.5) (for sufficiently large \(n\)) that

\[ a_{n,k+1}^{(n-k)(\tau_n + a + k)(b + k)} \frac{(n-d-k)(\tau_n + c + k)(1+k)}{(n-d-k)(\tau_n + c + k)(1+k)} > 1 \quad (k = 0, 1, \ldots, n-1), \]

which implies that the coefficients of

\[ 3F_2(-n, \tau_n + a, b; \tau_n + c, -n + d, z) \]

are positive and increasing:

\[ 0 < a_{n,0} < a_{n,1} < \cdots < a_{n,n}. \]

According to Lemma 2, we can see that the zeros of

\[ 3F_2(-n, \tau_n + a, b; \tau_n + c, -n + d, z) \]

lie inside the unit disk \(|z| \leq 1\). This completes the proof of Theorem 3. \(\square\)

We shall next use the following lemma, which we state here for the convenience of the interested reader.

**Lemma 3 (\[2,\text{Theorem 2}\]).** For arbitrary real numbers \(k > 0\) and \(l \geq 0\), the zeros of the following Gauss hypergeometric polynomials:

\[ 2F_1 \left[ \begin{array}{c}
-n, kn + l + 1; \\
kn + l + 2;
\end{array} \vphantom{\begin{array}{c}
-n, kn + l + 1; \\
kn + l + 2;
\end{array}} \right] \]

cluster on the loop of the lemniscate given by

\[ |z^k(z-1)| = \frac{k^k}{(k+1)^{k+1}} \quad \left( \Re(z) > \frac{k}{k+1} \right) \]

as \(n \to \infty\).

**Theorem 4.** For arbitrary real numbers \(k > 0\) and \(l \geq 0\), the zeros of the following Clausenian hypergeometric function:

\[ 3F_2 \left[ \begin{array}{c}
(k + \frac{1}{2})n + l + \frac{1}{2}, (k + \frac{1}{2})n + l + 1, kn + l; \\
(2k + 1)n + 2l + 1, kn + l + 1; \end{array} \vphantom{\begin{array}{c}
(k + \frac{1}{2})n + l + \frac{1}{2}, (k + \frac{1}{2})n + l + 1, kn + l; \\
(2k + 1)n + 2l + 1, kn + l + 1; \end{array}} \right] 1 - z^2 \]
cluster on the loop given by
\[ \frac{|z - 1|^k}{|z + 1|^{k+1}} = \frac{k^k}{2(k+1)^{k+1}} \left( \Re \left( \frac{z - 1}{z + 1} \right) > \frac{k}{k+1} \right) \]
as \( n \to \infty \).

Proof. By setting
\[
a = \left( k + \frac{1}{2} \right) n + \frac{1}{2}, \quad b = kn + l \quad \text{and} \quad \mu = 1 - z^2
\]
in the following hypergeometric reduction formula \[16\] p. 498, Equation (12):
\[
\begin{align*}
3F2 & \left[ \begin{array}{c}
a, a + \frac{1}{2}, b; \\
2a, b + 1;
\end{array} \right] \\
& = \left[ \frac{2}{\mu} \left( 1 - \sqrt{1 - \mu} \right) \right]^{2b} \cdot 2F1 \left[ \begin{array}{c}
b, 1 + 2b - 2a; \\
b + 1; 1 - \frac{2}{\mu} (1 - \sqrt{1 - \mu})
\end{array} \right],
\end{align*}
\]
we have
\[
3F2 \left[ \begin{array}{c}
(k + \frac{1}{2}) n + \frac{1}{2}, (k + \frac{1}{2}) n + l + 1, kn + l; \\
(2k + 1) n + 2l + 1, kn + l + 1; 1 - z^2
\end{array} \right] = \left( \frac{2}{1+z} \right)^{2nk+2l} \cdot 2F1 \left[ \begin{array}{c}
-n, kn + l + 1; \\
kn + l + 2; z - 1 \end{array} \right],
\]

We know from Lemma 3 that the zeros of the Gauss hypergeometric polynomials:
\[
\begin{align*}
2F1 & \left[ \begin{array}{c}
-n, kn + l + 1; \\
kn + l + 2; z - 1
\end{array} \right]
\end{align*}
\]
will cluster on the curve given by
\[
\frac{|z - 1|^k}{|z + 1|^{k+1}} = \frac{k^k}{2(k+1)^{k+1}} \left( \Re \left( \frac{z - 1}{z + 1} \right) > \frac{k}{k+1} \right)
\]
as \( n \to \infty \). This completes our proof of Theorem 4. \( \square \)

3. Numerical evidence and graphical illustrations

In this section, we make use of Mathematica (Version 4.0) in order to present numerical evidence and graphical illustrations for each of our results proved in the preceding section.

Figure 1 illustrates Theorem 1. It shows the location of the zeros of
\[ 3F2 (-n, \tau n + a, b; \tau n + c, -n + d; z) \]
for
\[
a = \frac{1}{2}, \quad b = \frac{1}{2}, \quad c = 1, \quad d = \frac{3}{4} \quad \text{and} \quad \tau = 1
\]
and various values of \( n \), together with their asymptotic curve \( |z| = 1 \).
Figures 2 and 3 illustrate Theorem 2 by showing the zeros of the following Clausenian hypergeometric polynomials:

\[ _3F_2 \left( -n, \frac{3}{2} n + \frac{1}{3}, \frac{3}{2} n + \frac{2}{3}; -n - \frac{1}{2}; z \right) \]

and

\[ _3F_2 \left( -n, -\frac{3}{2} n + \frac{3}{4}, \frac{3}{2} n + \frac{1}{2}; -n - \frac{1}{3}; z \right) , \]

respectively, for various values of \( n \), together with the unit circle (where they cluster as \( n \to \infty \)).

Figures 4 and 5 illustrate Theorem 3 by showing the zeros of the following Clausenian hypergeometric polynomials:

\[ _3F_2 \left( -n, \frac{1}{3} n + \frac{2}{3}, \frac{1}{3} n + \frac{1}{2}; -n - \frac{1}{2}; z \right) \]

and

\[ _3F_2 \left( -n, \frac{3}{2} n + \frac{1}{3}, \frac{3}{2} n + \frac{3}{4}; -n - \frac{1}{2}; z \right) , \]

respectively, for various values of \( n \), together with their asymptotic curve \(|z| = 1\).

Figure 6 displays the zeros of the following Clausenian hypergeometric polynomials:

\[ _3F_2 \left[ \left( k + \frac{1}{2} \right) n + l + \frac{1}{2}, \left( k + \frac{1}{2} \right) n + l + 1, kn + l; \right. \]

\[ \left. (2k + 1)n + 2l + 1, kn + l + 1; 1 - z^2 \right] \]

and the curve given by

\[ 2(k + 1)^{k+1}|z - 1|^k = k^k|z + 1|^{k+1} \quad \text{for} \quad k = \frac{1}{2} \]

and various values of \( n \) and \( l \). It provides an illustration of Theorem 4.
Figure 2. Zeros of $3F_2 \left( -n, \frac{3}{2}n + \frac{1}{3}; \frac{1}{2}n + \frac{2}{3}, -n - \frac{1}{2}; z \right)$ and the unit disk.

Figure 3. Zeros of $3F_2 \left( -n, -\frac{3}{2}n + \frac{3}{2}; \frac{1}{2}n + \frac{1}{2}, -n - \frac{1}{3}; z \right)$ and the unit disk.

Figure 4. Zeros of $3F_2 \left( -n, \frac{1}{2}n + \frac{3}{2}; \frac{1}{2}n + \frac{3}{2}, -n - \frac{1}{2}; z \right)$ and the unit disk.

Figure 5. Zeros of $3F_2 \left( -n, -\frac{3}{2}n + \frac{1}{3}; \frac{3}{2}n + \frac{3}{4}, -n - \frac{1}{2}; z \right)$ and the unit disk.
ASYMPTOTIC DISTRIBUTIONS OF THE ZEROS OF CERTAIN CLASSES

Figure 6. Zeros of \( _3F_2 \left[ \left( k + \frac{1}{2} \right) n + l + \frac{1}{2}, \left( k + \frac{1}{2} \right) n + l + 1, kn + l; \right. \)
\( (2k + 1)n + 2l + 1, kn + l + 1; 1 - z^2 \] for \( k = \frac{1}{2} \) and the curve
\( |z + 1|^3 = 27|z - 1| \).

4. Further remarks and observations

In our present investigation, we have considered several interesting problems concerning the asymptotic distribution of the zeros of various classes of the Clausenian hypergeometric \( _3F_2 \) functions and polynomials. In particular, we have made use of some classical analytic methods and techniques with a view to analyzing the behavior of the zeros of the Clausenian hypergeometric polynomials:

\[
_3F_2(-n, \tau_n + a, b; \tau_n + c, -n + d; z),
\]

where \( n \) is a nonnegative integer. We have also investigated some families of the hypergeometric \( _3F_2 \) functions which are connected (by means of a hypergeometric reduction formula) with the Gauss hypergeometric polynomials of the form:

\[
_2F_1(-n, kn + l + 1; kn + l + 2; z).
\]

Furthermore, numerical evidence and graphical illustrations of the clustering of zeros on certain curves are generated by Mathematica (Version 4.0).

We conclude this paper by observing below some of the salient features of our investigation and some further comparisons of our results with those that are available in the existing literature on the subject.

Remark 2. In Theorem 1 (see also Figure 1), we have considered the problem involving the asymptotic distribution of the zeros of the following general Clausenian hypergeometric polynomials:

\[
_3F_2 \left[ \begin{array}{c}
-n, \tau_n + a, b; \\
\tau_n + c, -n + d;
\end{array} \right] z
\]

\( (b \in \mathbb{C} \setminus \mathbb{Z}^-; d \in \mathbb{C} \setminus \mathbb{N}_0; \tau \neq 0; \tau n + a \neq 0, -1, \cdots, -n; \tau n + c \neq 0, -1, \cdots, -n) \)
when \( n \to \infty \). Some known special cases and examples include (among others) the \( _3F_2 \) polynomials:

\[
_3F_2 \left( -n, n + 1, \frac{1}{2}; n + t + 1, -n - t + 1; z \right),
\]

which were considered by Driver and Jordaan [6], and the \( _3F_2 \) polynomials:

\[
_3F_2 \left( -n, -2n - t, t; -2n, -n + \frac{1}{2}; z \right),
\]

which were investigated by Driver and Möller [10].
Remark 3. In Theorem 2 (see also Figures 2 and 3) and in Theorem 3 (see also Figures 4 and 5), we have given two sufficient conditions so that the zeros approach the unit circle in different directions.

Remark 4. By applying Lemma 3 (see [2]), in Theorem 4 (see also Figure 6) we have obtained the asymptotic distribution of the zeros of the following Clausenian hypergeometric function:

\[ 3F_2 \left[ \begin{array}{c} \frac{1}{2}\left(k + \frac{1}{2}\right) + (l + \frac{1}{2}), \frac{1}{2}\left(k + \frac{1}{2}\right) + (l + 1) + 1, \frac{1}{2}\left(k + \frac{1}{2}\right) + (l + 1); \\ \frac{1}{2}\left(2k + 1\right) + (2l + 1) + 1, \frac{1}{2}\left(k + \frac{1}{2}\right) + (l + 1); \\ 1 - z^2 \end{array} \right] \quad (k > 0; \ l \geq 0), \]

which is capable of yielding several simpler results for different choices for the real numbers \( k > 0 \) and \( l \geq 0 \).

Remark 5. By appropriately specializing the various parameters in each of our main results (Theorems 1 to 4 above), one can deduce many other (known or new) potentially useful corollaries and consequences than those we have already indicated in the preceding sections.

5. Uniform distribution of the zeros

In our paper, the parameters \( a, b, c, d \) and \( \tau \) are independent of the large parameter \( n \). Moreover, the zeros of the Clausenian hypergeometric polynomials:

\[ 3F_2(-n, \tau n + a, b; \tau n + c, -n + d; z), \]

are distributed uniformly along the curves (see Figures 1 to 6).

The zeros of the function \( H_n(b, u) \), defined by

\[
H_n(b, u) := u^n \ 3F_2 \left( b, -b - 2n, -n; -2n, -n + \frac{1}{2}; \frac{1}{2} \right)
\]

(5.1)

which were investigated in [10], are also distributed uniformly along the unit circle \( |u| = 1 \) (see [10, Proposition 4.4]). However, the figures in [10] actually showed the distribution of the zeros of \( 2F_1(-n, b; -2n; z) \), not the distribution of the zeros of the function \( H_n(b, u) \) defined by (5.1).

Since the transformation:

\[
(2w - 1)^2 - 1 = -u
\]

in (5.1) would lead to two branches of \( w \), the zeros of the Gauss hypergeometric polynomials:

\[ 2F_1(-n, b; -2n; z) \]

are not distributed uniformly along the whole Cassini curve. In fact, the zeros of

\[ 2F_1(-n, b; -2n; z) \]

are distributed only along the left branch of the curve (see [10]).
