THE TANGENT BUNDLE OF THE LONG LINE

JAMES A. MORROW

We prove the following surprise.

THEOREM. The tangent bundle of the long line is not trivial.

PROOF. The long line $L$ is defined in Hocking and Young [1], for example. It is easy to check that $L$, with the topology defined there, supports the structure of a $C^\infty$ manifold. In fact, it is proved in [2] that $L$ (there called the Alexandroff Half Line) can be made into a real analytic manifold (I thank the referee for this reference). Let us recall what it means for a real vector bundle $E$ to be trivial. The bundle $E \xrightarrow{\pi} X$ is trivial if there is a bundle map $\phi: E \rightarrow \xi^n$ covering the identity: $X \xrightarrow{\phi} X$, where $\xi^n$ is the trivial $\mathbb{R}^n$ bundle over $X$ and $n$ is the dimension of the fibre of $E$. But this is easily seen to be equivalent to the existence of a bundle map $\phi: E \rightarrow \mathbb{R}^n$ where $\mathbb{R}^n$ is considered as a bundle over a point $*$. (If $\omega: \xi^n \rightarrow \mathbb{R}^n$ is projection onto the coordinate of each fibre, then $\phi = \omega \circ \phi$ is such a map. If $\phi$ is given then $\phi^{-1}\mathbb{R}^n = \xi^n$ and $E \cong \phi^{-1}\mathbb{R}^n$ where $\phi^{-1}$ means the pull back under $\phi$.) So let $TL$ be the tangent bundle of $L$ and $\phi$ be a $C^\infty$ trivialization

$$TL \xrightarrow{\phi} \mathbb{R}^1$$

$$\pi \downarrow \downarrow$$

$$L \rightarrow *.$$

Then $g(x, y) = \phi(x) \cdot \phi(y)$ defines a $C^\infty$ positive definite inner product on the fibres of $TL$ ($\phi$ is an isomorphism on each fibre). Thus $L$ would be a Riemannian manifold. But it is well known (see Kobayashi-Nomizu [3, p. 166]) that a Riemannian manifold (not necessarily assumed paracompact) has a metric space structure which defines the manifold topology. Now it is well known that $L$ is not paracompact, and hence is not a metric space. This contradiction proves the theorem.
