A LINEARLY ORDERED RING
WHOSE THEORY ADMITS ELIMINATION OF QUANTIFIERS
IS A REAL CLOSED FIELD

L. P. D. VAN DEN DRIES

Abstract. Linearly ordered rings and preordered fields whose first order
theory admits quantifier elimination are shown to be real closed fields.

Introduction. An important result of A. Tarski states that the elementary
theory of a real closed ordered field admits quantifier elimination. In [1] the
following converse of Tarski's theorem was proved: an ordered field whose
elementary theory admits quantifier elimination is real closed. In this note we
strengthen this converse to the statement of the title. We also generalize in
another direction (see Remark 2).

Conventions. Rings are assumed to be associative with unit 1, and are
considered as L-structures with L = { +, ·, −, 0, 1}. A linearly ordered ring
is by definition a structure (R, <) with R a ring and < a linear order on R
such that for all a, b, c ∈ R:

a < b ⇒ a + c < b + c, (a < b and c > 0) ⇒ ac < bc.

To avoid the trivial case we will also assume that 0 ≠ 1. It follows that the
linearly ordered ring (Z, <) is uniquely embedded in any linearly ordered
ring. A linearly ordered ring is considered as an L( <)-structure, where
L( <) = { +, ·, −, 0, 1, <}.

The following easy lemma is basic.

Lemma. Let <b(x) be an open L( <)-formula in one free variable x, and let
(R, <) be a linearly ordered ring. Then there is n ∈ N such that

either ∀r ∈ R(r > n ⇒ (R, <) ⊨ b(r))
or ∀r ∈ R(r > n ⇒ (R, <) ⊨ ¬b(r)).

Proof. The property stated for b(x) is clearly preserved under taking
boolean combinations, so it suffices to consider the case that b(x) is a
formula p(x) > 0, where p(x) ∈ Z[X]. If p(x) is the zero polynomial, the first
alternative holds with n = 1, so suppose p(x) = a_d x^d + · · · + a_0, a_d, · · ·, a_0
∈ Z, a_d ≠ 0, say a_d > 0 (the case a_d < 0 is treated similarly).

Then we show that the first alternative holds for n any integer larger than
max(|a_0|, · · ·, |a_d|): let r > |a_i| + 1 for i = 0, · · ·, d. Then by induction on
i < d

This is trivially true for \( i = 0 \). So suppose \( i < d \) and (\( *) \) holds. Then

\[
\begin{align*}
(r^{i+1})' &= r \cdot r' \\
&\geq |a^i| r^i + |a_{i-1}| r^{i-1} + \cdots + |a_0| + 1.
\end{align*}
\]

So (\( *) \) is proved for \( i < d \). Taking \( i = d \) in (\( *) \) we get

\[
adrd^d > r^d > |a_{d-1}| r^{d-1} + \cdots + |a_0| + 1 > a_{d-1} r^{d-1} + \cdots + a_0,
\]

so \( p(r) > 0 \), for all \( r > \max(|a_0|, \ldots, |a_d|) + 1 \). □

**Theorem.** Let \((R, <)\) be a linearly ordered ring such that \(\text{Th}(R, <)\) admits elimination of quantifiers. Then \((R, <)\) is a real closed ordered field.

**Proof.** By Theorem 2 of [1], mentioned in the introduction, we have only to show that \( R \) is a (commutative) field. Let \( Z(x) \) be an open \( L(<) \)-formula defining the centre \( Z(R) \) of \( R \), i.e. \((R, <) \models Z(x) \iff \forall y (yx = xy)\). Because \( \mathbb{N} \subseteq Z(R) \), the lemma implies that there is \( n \in \mathbb{N} \) such that \( \forall r > n, r \in Z(R) \). Given any \( r \in R \) we have either \( r + n > n \) (if \( r > 0 \)), so \( r + n \in Z(R) \), or \( -r + n > n \) (if \( r < 0 \)), so \( -r + n \in Z(R) \), and in both cases it follows that \( r \in Z(R) \), hence \( R \) is commutative.

Similarly, let \( \text{sq}(x) \) be an open \( L(<) \)-formula defining the set of squares \( \text{sq}(R) \) of \( R \), i.e. \((R, <) \models \text{sq}(x) \iff \exists y (y^2 = x)\). Because \( n < n^2 \) for \( n \in \mathbb{N} \), the lemma implies:

1. there is \( M_1 \in \mathbb{N} \) such that \( \forall r \in R (r > M_1 \Rightarrow r \in \text{sq}(R)) \).

For \( n > M_1 \), let \( \sqrt{n} \) be a positive solution of \( x^2 = n \) in \( R \). Then \( (\sqrt{n} + 1 + \sqrt{n})(\sqrt{n} + 1 - \sqrt{n}) = 1 \), but the invertible element \( \sqrt{n} + 1 \) takes values larger than any natural number as \( n \) varies over the natural numbers \( > M_1 \).

So again the lemma implies:

2. there is \( M_2 \in \mathbb{N} \) such that \( \forall r \in R (r > M_2 \Rightarrow r \text{ is invertible in } R) \).

In particular \( M_2 \) is invertible, and if \( r > 1 \), then \( rM_2 > M_2 \), so by (2) \( rM_2 \) is invertible, which by the preceding remark implies that \( r \) is invertible. So we may even assume that \( (\mathbb{Q}, <) \subseteq (R, <) \), and a similar argument as above shows

3. each \( r \in R \) with \( |r| > q \) for some positive rational \( q \) is invertible.

We will now show

4. each noninvertible element of \( R \) is nilpotent.

Suppose that \( r \) is not invertible and \( r > 0 \) (so \( r \) is infinitesimal by (3)), and let \( p(x) \in \mathbb{Z}[x] - \{0\} \), say \( p(x) = a_dx^d + \cdots + a_0x^e \) with \( d > e, a_d, \ldots, a_e \in \mathbb{Z}, a_d \neq 0, a_e \neq 0 \).

Then \( p(r) = r^e(\sum a_d r^{d-e} + \cdots + a_e) \) and \( a_d r^{d-e} + \cdots + a_e \) is infinitely close to \( a_e \), so is invertible by (3). Hence

\[
\begin{align*}
p(r) &> 0 \iff a_e > 0 \text{ and } r^e \neq 0, \\
p(r) &= 0 \iff r^e = 0, \\
p(r) &< 0 \iff a_e < 0 \text{ and } r^e \neq 0.
\end{align*}
\]
But the noninvertibles in $R$ can be defined by an open $L(\prec)$-formula which may be taken as a disjunction of formulas

$$p_1(x) = \cdots = p_k(x) = 0 \land q_1(x) > 0 \land \cdots \land q_l(x) > 0,$$

with $k + l > 0, p_1, \ldots, p_k, q_1, \ldots, q_l \in \mathbb{Z}[x] \setminus \{0\}$.

So $r$ has to realize such a disjunction. Combining this fact with the above observation leads to:

$r$ is nilpotent or each sufficiently small positive rational number is not invertible in $R$. Using (3) we obtain that $r$ is nilpotent, and we have finished the proof of (4).

Before taking the final step in the proof, i.e. (5), we need some preparations. Let $p$ be some prime number larger than $M_2$ and let $\sqrt{p}$ be the unique positive solution in $R$ of $x^2 = p$, which exists by (2), and is unique, because, if $r > 0$, then $(\sqrt{p} + r)^2 = p + 2r\sqrt{p} + r^2 > p$. Replacing $(R, \prec)$, if necessary, by a suitable elementary extension, we may assume that $R$ contains an invertible infinitesimal $\delta$, i.e. $|\delta| < q$ for each rational $q > 0$.

Now we can prove

(5) $R$ has no nilpotent other than zero.

Suppose that $R$ has a nilpotent $r \neq 0$. Then there is $e > 0$ in $R$ with $e^2 = 0$. Consider now the two ordered subrings $(\mathbb{Z}[e, e \cdot \sqrt{p}], \prec)$ and $(\mathbb{Z}[e, e \cdot (\sqrt{p} + \delta)], \prec)$ of $(R, \prec)$. Each element of $\mathbb{Z}[e, e \cdot \sqrt{p}]$ can be written uniquely in the form $a + be + ce\sqrt{p}$ with $a, b, c \in \mathbb{Z}$, and similarly an element of $\mathbb{Z}[e, e \cdot (\sqrt{p} + \delta)]$ equals $a + be + ce(\sqrt{p} + \delta)$ for a unique triple $(a, b, c) \in \mathbb{Z}^3$. For such $a, b, c \in \mathbb{Z}$ we have

$$a + be + ce\sqrt{p} > 0 \iff a > 0 \text{ or } (a = 0 \text{ and } b + c\sqrt{p} > 0) \iff a > 0 \text{ or } (a = 0 \text{ and } b + c(\sqrt{p} + \delta) > 0) \iff a + be + ce(\sqrt{p} + \delta) > 0.$$

This argument shows that there is an isomorphism of $(\mathbb{Z}[e, e \cdot \sqrt{p}], \prec)$ onto $(\mathbb{Z}[e, e \cdot (\sqrt{p} + \delta)], \prec)$ mapping $e$ and $e\sqrt{p}$ onto $e$ and $e(\sqrt{p} + \delta)$, respectively. By assumption there is an open formula $\psi(y, z)$ such that $(R, \prec) \models \psi(y, z) \iff \exists x(x^2 = p \land xy = z)$. Then it follows from $(R, \prec) \models \psi(e, e\sqrt{p})$ and the above isomorphism that $(R, \prec) \models \psi(e, e(\sqrt{p} + \delta))$. But this means that $e\sqrt{p} = e(\sqrt{p} + \delta)$, so $e\delta = 0$, contradicting $e \neq 0$ and the invertibility of $\delta$. So (5) is proved.

It is clear that (4) and (5), together with the commutativity of $R$, imply that $R$ is a field. □

Remarks.

(1) Improving at some points the proof of the theorem we see that in fact the following is true.

Let $(R, \prec)$ be a linearly ordered ring. Then $A$ and $B$ below are equivalent:

A. $(R, \prec)$ is a euclidean ordered field, i.e. an ordered field such that $\{r \in R | r > 0\} = \text{sq}(R) \overset{\text{def}}{=} \{r^2 | r \in R\}$.
B. The centre \( Z(R) \) of \( R \), sq(\( R \)), the set of invertible elements of \( R \) are each definable by an open \( L(\prec) \)-formula, and the formula \( \exists x(x^2 = 2 \land xy = z) \) is equivalent to an open \( L(\prec) \)-formula with respect to \( \text{Th}(R, \prec) \).

That the last condition in B cannot be omitted is shown by the following example: endow \( \mathbb{R}[X] \) with the linear order \( \prec \) which extends the usual order on \( \mathbb{R} \) and makes \( X \) a positive infinitesimal.

Let \( R = \mathbb{R}[X]/(X^2) \) and endow \( R \) with the linear order \( \prec \) making the canonical map \( \mathbb{R}[X] \to R \) a morphism of \( (\mathbb{R}[X], \prec) \) onto \( (R, \prec) \). Then \( R \) is not a field, but \( Z(R) \), sq(\( R \)), and the set of invertible elements of \( R \) are each definable by an open \( L(\prec) \)-formula.

(2) We can extend Theorem 2 of [1] also in another direction: recall that a preordered field is a structure \( (K, \prec) \) with \( K \) a field and \( \prec \) a (partial) order on \( K \) such that for all \( a, b, c \in K \):

\[
0 \prec a^2, \quad a \prec b \Rightarrow a + c \prec b + c, \quad \text{and} \quad (a \prec b \land c > 0) \Rightarrow ac \prec bc.
\]

Then we have:

A preordered field \( (K, \prec) \) with the property that \( \text{Th}(K, \prec) \) admits elimination of quantifiers is real closed.

**Sketch of proof.** The lemma and its proof go through for \( (K, \prec) \). As in the proof of the theorem one can then show that for some \( M \in \mathbb{N} \) each \( r > M \) is a square, from which one easily derives (using multiplication with a suitable square) that each \( r > 0 \) is a square. Similarly, one shows that each \( r > 0 \) is a fourth power. Now, given any \( r \in K \), one can then write \( r^2 = s^4 \) for some \( s \in K \), so \( r = s^2 \) or \( r = -s^2 \), i.e. \( r > 0 \) or \( r < 0 \). Hence the preorder is a linear order, and we are reduced to Theorem 2 of [1].

I thank M. Boffa for reviving my interest in the subject.
