INTEGRAL REPRESENTATION OF MULTIPLICATIVE,
INVOLUTION PRESERVING OPERATORS IN $\mathcal{S}(C_0(S, A), B)$

STEPHEN T. L. CHOY

Abstract. Bounded linear operators from the space of continuous vector-valued
functions which preserve multiplication and involution are characterized in terms
of their representing measures. A key role is played by the Arens product in the
second dual of a Banach algebra.

1. Introduction. Let $S$ be a Hausdorff topological space and let $A, B$ be locally
convex Hausdorff topological vector spaces over the real or complex field. Denote
by $C(S, A)$ the space of continuous functions from $S$ to $A$ and let $C_0(S, A)$ be the
subspace of continuous functions vanishing at infinity. If $A = \mathbb{C}$, the set of all
complex numbers, we simply write $C(S)$ or $C_0(S)$. Let $T$ be a bounded linear
operator from $C(S, A)$ or $C_0(S, A)$ to $B$. Riesz type representation theorems for $T$
have been studied by numerous authors, for example, see Bartle, Dunford and
Schwartz [2], Dinculeanu [6], J. Gil de Lamadrid [7], Goodrich [8], Brooks and
Lewis [4] and the author [5]. Now if $A, B$ are Banach algebras with involution and
$T$ preserves multiplication and involution, it is natural to ask how these properties
are reflected in the representing measure $K$. It was G. W. Johnson [10] who first
solved this problem for the case where $S$ is compact, $A = \mathbb{C}$ and $B$, as a Banach
space, is the dual of another Banach space.

In this paper, by using the Arens product in the second dual of a Banach
algebra, we solve this problem in a more general setting. A convenient reference for
the Arens product could be found in Bonsall and Duncan [3]. The reader is
referred to [3, §12] for details of notation and terminology concerning the Arens
product not explained here.

In the remainder of this paper $S$ is a locally compact Hausdorff space, $A$ and $B$
are Banach algebras, and $T$ is a bounded linear operator from $C_0(S, A)$ to $B$;
where $C_0(S, A)$ is endowed with the topology of uniform convergence. Let $C_0(S)$
$\hat{\otimes} A$ be the completion of the algebraic tensor product $C_0(S) \otimes A$ with respect to
the least cross norm. Then $C_0(S) \hat{\otimes} A = C_0(S, A)$, where $C_0(S, A)$ is endowed with
the uniform norm and the equation indicates isometry between the two spaces (see,
for example, [7]). Given $f' \in C_0(S, A)$ and $x \in A$, the map $f \mapsto f'(f \cdot x)$ for
$f \in C_0(S)$ is an element of $C_0(S)$. Hence there is a unique regular Borel measure
$\mu(x, f')$ such that $\int f \, d\mu(x, f') = f'(f \cdot x)$ for $f \in C_0(S)$. Now given $e$ in $C(S)$, the
Borel class of $S$, and $x \in A$, $1_e \otimes x$ can be viewed as an element of $C_0^*(S, A)$: $(1_e \otimes x)(f') = \mu(x, f')(e)$. Brooks and Lewis [4] show that for each bounded linear operator $T$ from $C_0(S, A)$ to $B$ there is a unique weakly regular set function $K$ from $\mathcal{B}(S)$ to $\mathbb{L}[A, B]$ so that $T(f) = \int f dK$; in fact, $K(e)x = T''(1_e \otimes x)$.

Throughout this paper multiplication in the second dual of a Banach algebra is defined by the Arens product. The second dual of a Banach algebra is again a Banach algebra under the Arens product [3]. I am greatly indebted to the referee for this helpful comments on the presentation of this paper.

2. Multiplicative operators. In this section we obtain a representation theorem for multiplicative operators in the following

**Theorem 2.1.** The operator $T$ satisfies $T(fg) = T(f)T(g)$ for all $f, g \in C_0(S, A)$ iff the representing measure $K$ satisfies $K(e_1 \cap e_2)(xy) = (K(e_1)x)(K(e_2)y)$ for all $x, y \in A$ and $e_1, e_2 \in \mathcal{B}(S)$.

Before we can prove the theorem we need the following two results:

**Proposition 2.2.** Let $A, B$ be Banach algebras and let $T: A \to B$ be a bounded linear operator. Then the operator $T$ satisfies $T(fg) = T(f)T(g)$ for all $f, g \in A$ iff $T''(FG) = T''(F)T''(G)$ for all $F, G \in A''$ where $T''$ is the second adjoint of $T$.

**Proof.** Since $A \subseteq A''$ all we have to do is to prove the necessity. For every $b' \in B'$,

$$T''(FG)(b') = (FG)(T''(b')) = F\{[G, T''(b')]\},$$

$$(T''(F)T''(G)(b')) = T''(F)[T''(G), b'] = F(T'[T''(G), b']).$$

For $f \in A$,

$$[G, T''(b')](f) = G(\langle T''(b'), f \rangle),$$

$$T'[T''(G), b'](f) = [T''(G), b'][T(f)]$$

$$= T''(G)(\langle b', T(f) \rangle) = G(T''b', T(f)).$$

For $g \in A$,

$$\langle T''(b'), f \rangle(g) = T''(b')(fg) = b'(T(fg)).$$

$$T''\langle b', T(f) \rangle(g) = \langle b', T(f)\rangle(T(g)) = b'(T(f)T(g))$$

$$= b'(T(fg)).$$

We conclude that $T''(FG) = T''(F)T''(G)$.

**Lemma 2.3.** For $e_1, e_2 \in \mathcal{B}(S)$, $x, y \in A$, $(1_e \otimes x)(1_e \otimes y) = 1_{e_1 \cap e_2} \otimes xy$.

**Proof.** For $g' \in C_0(S, A)$,

$$(1_e \otimes (1_e \otimes y))(g') = (1_e \otimes x)[(1_e \otimes y), g']$$

$$= \mu(x, [(1_e \otimes y), g'')(e_1),$$

$$(1_{e_1 \cap e_2} \otimes xy)(g') = \mu(xy, g')(e_1 \cap e_2) = \nu(xy, g')(e),$$

where $\nu(xy, g')(e) = \int \chi_e \, d\mu(xy, g')$, and $\chi_e$ is the characteristic function of $e$.

For \( g \in C_0(S) \),
\[
\int g \, d\mu(x, [(1_{e_2} \otimes y), g']) = [(1_{e_2} \otimes y), g'](g \cdot x)
\]
\[
= (1_{e_2} \otimes y)(\langle g', g \cdot x \rangle) = \mu(y, \langle g', g \cdot x \rangle)(e_2),
\]
\[
\int g \, d\nu(xy, g') = \int g \chi_{e_2} \, d\mu(xy, g') = \int g \, d\mu(xy, g') = w(e_2).
\]

For \( h \in C_0(S) \),
\[
\int h \, d\mu(y, \langle g', g \cdot x \rangle) = \langle g', g \cdot x \rangle(h \cdot y) = g'(gh \cdot xy),
\]
\[
\int h \, d\nu = \int h \chi_{e_2} \, d\mu(xy, g') = g'(hg \cdot xy).
\]

This completes the proof of the lemma.

**Proof of Theorem 2.1.** Suppose for \( f, g \in C_0(S, A) \), \( T(fg) = T(f)T(g) \). By Proposition 2.2 and Lemma 2.3, for \( e_1, e_2 \in \mathcal{B}(S) \),
\[
K(e_1 \cap e_2)(xy) = T''(1_{e_1 \cap e_2} \otimes xy) = T''(1_{e_1} \otimes x)(1_{e_2} \otimes y)
\]
\[
= T''(1_{e_1} \otimes x)T''(1_{e_2} \otimes y) = (K(e_1)x)(K(e_2)y).
\]

Now suppose \( K(e_1 \cap e_2)(xy) = (K(e_1)x)(K(e_2)y) \) for \( e_1, e_2 \in \mathcal{B}(S), x, y \in A \). If \( f = x_{e_1} \cdot x, g = x_{e_2} \cdot y \), then,
\[
\int fg \, dK = \int x_{e_1 \cap e_2}xy \, dK = K(e_1 \cap e_2)xy
\]
\[
= (K(e_1)x)(K(e_2)y) = \left( \int f \, dK \right) \left( \int g \, dK \right).
\]

For arbitrary \( f, g \in C_0(S, A) \), a routine argument as in the last part of the proof of [10, Theorem 1] shows that \( \int fg \, dK = \int f \, dK \int g \, dK \) and this completes the proof of the theorem.

**3. Involution preserving operators.** In this section we assume that \( A, B \) are Banach algebras with isometric involution \( * \). For \( f \in C_0(S) \), \( x \in A \), we define \( (f(s) \cdot x)^* = f(s)^* \cdot x^* \), where the bar denotes the complex conjugate. For \( f \in C_0(S, A) \), \( f^* \) is defined in the natural way by taking the limit process. Recall that involutions could be defined in \( A' \) and \( A'' \) in a natural way (see, for example, Bonsall and Duncan [3]).

**Lemma 3.1.** For \( x \in A, e \in \mathcal{B}(S) \), \( (1_e \otimes x)^* = (1_e \otimes x^*) \).

**Proof.** For \( f' \in C_0(S, A) \),
\[
(1_e \otimes x^*)(f') = \mu(x^*, f')(e),
\]
\[
(1_e \otimes x)(f') = ((1_e \otimes x)((f')^*))^* = (\mu(x, (f')^*))(e)^*.
\]
For \( f \in C_0(S) \),

\[
\int f \, d\mu(x^*, f') = f'(f \cdot x^*),
\]

\[
\int f \, d\nu(x, (f')^*) = \left( \int f \, d\mu(x, (f')^*) \right)^* = \left( (f')^* (f' \cdot x)^* \right)^* = f'(f \cdot x^*),
\]

and the lemma is proved.

**Proposition 3.2.** Let \( T: A \rightarrow B \) be a bounded linear operator. Then the operator \( T \) satisfies \( T(f^*) = (T(f))^* \) for all \( f \in A \) iff \( T''(F^*) = (T''(F))^* \) for all \( F \in A'' \).

**Proof.** We only prove the necessity. For \( b' \in B' \),

\[
T''(F')(b') = F'(T'(b')), \\
(T''(F))^*(b') = (T''(F))(b')^* = (F(T'(b')))^* = F'((T'(b'))^*).
\]

For \( f \in A \),

\[
(T'((b')^*)^*(f) = (T'((b')^*)((f^*)^*) = ((b')^*(T(f))^*) = ((b')^*((T(f))^*)^*) = b'(T(f)).
\]

This completes the proof of the proposition.

We are now ready to prove the following theorem, which shows that the involution preserving property of an operator is reflected naturally in its representing measure.

**Theorem 3.3.** The operator \( T \) satisfies \( T(f^*) = (T(f))^* \) for all \( f \in C_0(S, A) \) iff \( (K(e)x)^* = K(e)x^* \) for all \( e \in \mathfrak{B}(S), x \in A \).

**Proof.** If \( T(f^*) = (T(f))^* \) then, by Proposition 3.2, Lemma 3.1, \( (K(e)x)^* = (T''(1_x \otimes e))^* = T''(1_x \otimes x^*) = K(e)x^* \).

On the other hand suppose \( (K(e)x)^* = K(e)x^* \) for all \( e \in \mathfrak{B}(S), x \in A \). If \( f = \chi_x \cdot x \), then \( f^* = \chi_x \cdot x^* \) and

\[
\left( \int \chi_x \cdot x \, dK \right)^* = (K(e)x)^* = K(e)x^* = \int \chi_x \cdot x^* \, dK.
\]

For \( f \in C_0(S, A) \), a routine argument again shows that \( (T(f))^* = T(f^*) \).

We conclude this paper with a remark that results of this paper may be used to prove the Spectral Theorem for bounded operators (see Johnson [9, p. 99]).
