THE COHOMOLOGY OF $BSO_n$ AND $BO_n$
WITH INTEGER COEFFICIENTS

EDGAR H. BROWN, JR.

ABSTRACT. The cohomology rings of $BSO_n$ and $BO_n$, with integer coefficients, are given by generators and relations expressed in terms of characteristic classes.

Recently I wished to know the cohomology, with integer coefficients, of $BO_n$ in terms of characteristic classes. I was unable to find this in the literature but found it could be calculated by standard techniques. The results of these calculations and brief proofs are given below. For the sake of completeness and because very little extra effort is required, I have included a variety of well-known results including the existence of Stiefel-Whitney, Chern and Pontrjagin classes—starting from the Thom isomorphism and basic facts about vector bundles, (for example, see [1 and 2]). The only new results in this paper are fairly simple, direct descriptions of $H^*(BO_n; Z)$ and $H^*(BSO_n; Z)$ in terms of Pontrjagin and Stiefel-Whitney classes. These results are implicitly contained in papers of Emery Thomas [3, 4, 5 and 6] and similar results have been obtained by Mark Feshbach [7].

1. Statement of theorems. Let $G_n = U_n$, $O_n$ or $SO_n$, let $\xi_n = \xi(G_n)$ be the universal $n$-plane bundle over $BG_n$ and let $E_n$ and $S_n$ be the total space of $\xi_n$ and the space of nonzero vectors of $\xi_n$, respectively. Recall, one may identify $E_n$ and $S_n$ with $BG_n$ and $BG_n - i$ so that the inclusion $S_n \subset E_n$ corresponds to the classifying map $BG_{n-1} \rightarrow BG_n$ of $\xi_{n-1}$ plus the trivial line bundle. We denote by $i$ and $j$ the inclusion maps $i: BG_{n-1} \rightarrow BG_n$ and $j: BG_n \rightarrow (BG_n, BG_{n-1})$.

Let $V_n \in H^n(BG_n, BG_{n-1}; \Lambda)$ be the Thom class where $\Lambda = n$ or $2n$ according as $Gr. = O_n$, $SO_n$ or $G_n = U_n$ and $\Lambda = Z$ or $Z_2$ as $G_n = SO_n$, $U_n$ or $G_n = O_n$. Let $X_n = j^*V_n \in H^n(BG_n; \Lambda)$.

We denote by $p$ and $\delta$ the maps in the long exact sequence,

\[\begin{array}{cccccc}
H^q(X; Z) & H^q(X; Z) & H^q(X; Z) & H^q+1(X; Z) \\
\delta & \delta & \delta & \delta
\end{array}\]

which comes from the sequence $0 \rightarrow Z^2 \rightarrow Z \rightarrow Z_2 \rightarrow 0$.

**Theorem 1.2.** There are unique classes $w_q = w_q(O_n) \in H^q(BO_n; Z_2)$ such that $w_q(O_{n-1}) = i^*w_q(O_n)$, $q < n$, and $w_n(O_n) = X_n(O_n)$. Furthermore,

\[w_q V_n = S^q V_n, \quad H^*(BO_n; Z_2) = Z_2[w_1, w_2, \ldots, w_n]\]

and under the Whitney sum map

\[BO_m \times BO_n \rightarrow BO_{m+n}, \quad w_q \rightarrow \sum w_i \otimes w_{q-i} \quad (w_0 = 1)\]
THEOREM 1.3. Let \( w_q = w_q(\zeta(SO_n)) \in H^q(BSO_n; Z_2) \). Then \( w_1 = 0 \) and
\[
H^*(BSO_n; Z_2) = \mathbb{Z}_2[w_2, w_3, \ldots, w_n].
\]

THEOREM 1.4. There are unique classes \( c_q = c_q(U_n) \in H^{2q}(BU_n; Z) \) such that
\[
i^* c_q(U_n) = c_q(U_{n-1}), \quad q < n, \quad \text{and} \quad c_n(U_n) = X_n(U_n).
\]
Furthermore
\[
H^*(BU_n; Z) = \mathbb{Z}[c_1, c_2, \ldots, c_n],
\]
under the Whitney sum map \( BU_m \times BU_n \to BU_{m+n} \),
\[
c_q \mapsto \sum c_i \otimes c_{q-i}
\]
and \( \rho c_q(U_n) = w_{2q}(\zeta(U_n)) \).

THEOREM 1.5. Let \( p_q = (-1)^q c_{2q}(\zeta(SO_n) \otimes C) \in H^{4q}(BSO_n; Z) \) where \( \zeta(SO_n) \otimes C \) denotes the complexification of \( \zeta(SO_n) \). Then \( H^*(BSO_n; Z) = \mathcal{K}_n/I_n \) where
\[
\mathcal{K}_n = \mathbb{Z}[p_1, \ldots, p_{(n-1)/2}, X_n, \delta(w_{2i_1} w_{2i_2} \cdots w_{2i_1})|0 < i_1 < \cdots < i_1 \leq [(n-1)/2]],
\]
and \( I_n \) is the ideal generated by the relations:
\[
2\delta(w_{2i_1} \cdots w_{2i_1}) = 0, \quad X_n = \delta w_{2k} \text{ if } n = 2k + 1, \quad \text{and, if for } I = \{i_1, i_2, \ldots, i_s\}, \quad w(2I) = w_{2i_1} w_{2i_2} \cdots w_{2i_s} \text{ and } p(I) = p_{i_1} p_{i_2} \cdots p_{i_s}, \quad \text{then}
\]
\[
\delta w(2I) \delta w(2J) = \sum_{k \in I} (\delta w_{2k}) p((I - \{k\}) \cap J) \delta w(2(\{I - \{k\}) \cup J - (I - \{k\}) \cap J)).
\]
Furthermore, \( \rho(p_q) = w_{2q}^2, \rho \delta = S^1, \) and if \( n \) is even, \( p_{n/2} = X_n^2 \). Under Whitney sum, \( X_{n+m} \to X_m \otimes X_n \) (see 1.6 for the behavior of \( p_q \) under Whitney sum).

THEOREM 1.6. Let
\[
p_q = (-1)^q c_{2q}(\zeta(O_n) \otimes C) \in H^{4q}(BO_n; Z).
\]
Then, \( H^*(BO_n; Z) = \mathcal{K}_n/I_n \) where
\[
\mathcal{K}_n = \mathbb{Z}[p_1, \ldots, p_{n/2}, \delta(w_{2i_1} w_{2i_2} \cdots w_{2i_1})|0 \leq 1 < \cdots < i_1 \leq [n/2]],
\]
and \( I_n \) is the ideal generated by the relations:
\[
2\delta(w_{2i_1} \cdots w_{2i_1}) = 0, \quad \delta(w_{1} w_{n}) = 0 \quad \text{and} \quad (\delta w_{2k})^2 = p_{n/2} \delta w_{1}, \quad \text{if } n \text{ is even. Also, if for } I = \{\epsilon/2, i_1, \ldots, i_s\}, \quad w(2I) = w_{2i_1} w_{2i_2} \cdots w_{2i_s} \text{ and } p(I) = (\delta w_1)^s p_{i_1} \cdots p_{i_s}, \quad \text{then } I_n \text{ contains relations for}
\]
\[
\delta w(2I) \delta w(2J) = \sum_{k \in I} (\delta w_{2k}) p((I - \{k\}) \cap J) \delta w(2(\{I - \{k\}) \cup J - (I - \{k\}) \cap J)).
\]
Furthermore, \( \rho(p_q) = w_{2q}^2, \rho \delta = S^1 \) and under Whitney sum, \( p_q \to \sum r_{2q-j} \otimes r_{j} \) where \( r_{2s} = p_{s} \) and \( r_{2s+1} = (\delta w_{2s})^2 + p_{s} \delta w_{1} \).

2. Proofs. We prove 1.2–1.6 by induction on \( n \). For the inductive step we use the following exact sequence; \( H^*(BG_n) \) denotes cohomology with \( Z_2 \) coefficients when \( G_n = O_n \) and \( Z \) coefficients otherwise.

\[
\begin{array}{c}
H^{q-1}(BG_{n-1}) \xrightarrow{\delta^*} H^q(BG_{n-1}) \xrightarrow{i^*} H^q(BG_n) \xrightarrow{j^*} H^q(BG_{n-1}) \\
\cup V_n & H^q(BG_n) \cup X_n
\end{array}
\]

The map \( \cup V_n \) is an isomorphism by the Thom isomorphism theorem.
For \( n = 0 \), \( BG_n \) is a point and 1.2–1.6 are trivial. Suppose 1.2–1.6 are true for \( n - 1 \).

**Proof of 1.2.** \( H^q(BO_n) = 0 \) for \( q < n \) and hence \( i^* : H^q(BO_n) \cong H^q(BO_{n-1}) \) for \( q < n \). Hence there are unique classes \( w_q \in H^q(BO_n) \) such that \( i^* w_q = w_q \), \( q < n \), and \( w_n \) is defined to be \( X_n \). Since \( H^*(BO_{n-1}) = \mathbb{Z}[w_1, \ldots, w_{n-1}] \), \( i^* \) is an epimorphism and thus \( \cup X_n \) is a monomorphism. Induction \( q \) now shows that \( H^*(BO_n) = \mathbb{Z}[w_1, \ldots, w_n] \). Under the bundle map, \( \chi_{n-1} \times R \rightarrow \chi_n \), the Thom class \( V_n \in H^n(BO_n, BO_{n-1}) \) goes into \( V_{n-1} \otimes U \in H^n(BO_{n-1}, BO_{n-2}) \times R(R, R - 0) \), where \( U \in H^1(R, R - 0) \) is the generator. Thus for \( i < n \), \( Sq^i V_n \) goes into \( Sq^i V_{n-1} \otimes U = w_i V_{n-1} \otimes U \). Hence \( Sq^i V_n = w_i \cup V_n \). For \( i = n \), \( Sq^n V_n = V_n^2 = (i^* V_n)V_n = w_n V_n \). From commutativity of the diagram

\[
\begin{array}{ccc}
BO_m \times BO_{n-m-1} & \rightarrow & BO_{n-1} \\
\downarrow & & \downarrow \\
BO_m \times BO_{n-m} & \rightarrow & BO_n
\end{array}
\]

\( w_q \in H^q(BO_n) \), \( q < n \), goes into \( \sum w_{q-p} \otimes w_p \). Under the Whitney sum map, at the Thom space level, \( V_n \rightarrow V_m \otimes V_{n-m} \) and hence \( w_n = X_n \rightarrow w_m \otimes w_{n-m} \).

**Proof of 1.3.** For \( n = 1 \), \( w_1 = 0 \in H^1(BO_1) = H^1(pt) \). The inductive step is the same as the inductive step above that shows \( H^*(BO) = \mathbb{Z}[w_1, \ldots, w_n] \).

**Proof of 1.4.** The proof is the same as for 1.2. As part of the induction one proves that \( \rho(c_2) = w_2 \) from the fact that \( \rho V(U_n) \) is the Thom class with \( \mathbb{Z}_2 \) coefficients of \( \chi(U_n) \) as a real 2n bundle.

**Proof of 1.5.** The following is an immediate consequence of the exact sequence 2.1.

**Lemma 2.2.** Suppose \( H^*(X; Z) \) has the property that if \( u \in H^*(X; Z) \) and \( ku = 0 \) for some \( k \), then \( 2u = 0 \). Then for \( v \in H^*(X; Z_2) \), \( \delta v = 0 \) if and only if \( Sq^1 v = 0 \) (\( Sq^1 = \rho \delta \)). Furthermore, if \( T \subset H^*(X; Z_2) \) is the torsion subgroup, \( T = \delta H^*(X; Z_2) \) and \( \rho T : T \rightarrow H^*(X; Z_2) \) is an injection.

We next show that \( \rho(p_i) = w_{2i} \).

\[
\rho(p_i) = \rho(c_{2i}(\chi_n \otimes C)) = w_{4i}(\chi_n \otimes C) = w_{4i}(2\chi_n) = w_{2i}^{2i}(\chi_n).
\]

In the following, \( H^*(BSO_n) = H^*(BSO_n; Z) \). The generators of \( \chi_n \), \( p_1 \), \( p_2 \), etc., denote elements in \( H^*(BSO_n) \) and hence define a map \( \theta : \chi_n \rightarrow H^*(BSO_n) \). We show that \( \theta^*(\chi_n) = 0 \).

\[
(Sq^1 w_{2k})V_n = Sq^1 (w_{2k} V_n) + w_{2k} Sq^1 V_n = Sq^1 Sq^2 V_n = Sq^{2k+1} V_n = w_{2k+1} V_n.
\]

Hence \( Sq^1 w_{2k} = w_{2k+1} \). Thus \( \rho X_{2k+1} = w_{2k+1} = \rho \delta w_{2k} \).

The fact that \( \rho \delta \) takes the relations for \( \delta w(2I) \delta(w(2J)) \) to zero follows by induction on the length of \( I \) and the following identities:

\[
Sq^1 X Sq^1(YZ) + Sq^1(XY) Sq^1 Z + Sq^1(XZ) Sq^1 Y = 0,
\]

\[
p_i Sq^1 X = Sq^1(Xw_{2i}^2).
\]

Now suppose \( n \) is even. Note \( \chi_n / \chi_n = (\chi_{n-1} / \chi_{n-1})[X_n] \). By inductive hypothesis, \( i^* \theta \) and hence \( i^* : H^*(BSO_n) \rightarrow H^*(BSO_{n-1}) \) is an epimorphism.
Therefore we have an exact sequence:

\[(2.3) \quad 0 \to H^{q-n}(BSO_n) \cup X_n \to H^q(BSO_n) \to H^q(BSO_{n-1}) \to 0\]

Induction on \(q\) shows that \(\theta\) is an epimorphism. We wish to show that \(H^*(BSO_n)\) satisfies 2.2, that is, its torsion is a \(\mathbb{Z}_2\) vector space. Since \(2\delta = 0\), we must show that the subalgebra generated by \(\{p_i, X_n\}\) has no torsion. This follows from 2.3 and induction on \(q\), that is, such a torsion element must be zero in \(H^*(BSO_{n-1})\) and hence divisible by \(X_n\). Lemma 2.2 and \(\rho \theta I_n = 0\) yield \(\theta I_n = 0\).

The sequence 2.3 and induction on \(q\) now show that \(\mathcal{R}_n/\mathcal{I}_n = H^*(BSO_n)\).

The relation \(X_n^2 = p_{n/2}\) is obtained by tracing \(X(\Sigma_2n)\) around the diagram

\[
\begin{array}{c}
BSO_n \\
\downarrow \\
BSO_n \times BSO_n \\
\downarrow \\
BSO_{2n}
\end{array}
\]

(the sign choice, \(p_q = (-1)^qc_{2q}\) comes into play).

Now suppose \(n\) is odd. As we saw above, \(\rho X_n = \rho \delta w_{n-1}\) and hence \(X_n = \delta w_{n-1} + 2u, u \in H^{n-1}(BSO_n)\).

\[2X_nV_n = 2V_n^2 = 0.\]

Hence \(2X_n = 0\) and \(4u = 0\). But \(H^{n-1}(BSO_n) \approx H^{n-1}(BSO_{n-1})\) and hence \(2u = 0\). Therefore \(X_n = \delta w_{n-1}\).

Let \(\theta: \mathcal{R}_n \to H^*(BSO_n)\) as above. We show that image \((i*\theta) = \text{kernel} \delta^* = \text{image} i^*\) and hence, by induction on \(q\) in the exact sequence 2.1, that \(\theta\) is an epimorphism.

Since \(2X_n = 0\), \(2V_n \in \text{image} \delta^*\). The only elements in \(H^{n-1}(BSO_{n-1})\) not in the image of \(i^*\theta\) are multiples of \(X_{n-1}\). Hence \(\delta^* X_{n-1} = 2V_n\). Any element of \(H^*(BSO_{n-1})\) has the form \(u = i^*\theta u_1 + (i^*\theta(u_2))X_{n-1}\). \(\delta^* u = \theta(u_2)\delta^* X_{n-1} = 2\theta(u_2)V_n\). Therefore \(\delta^* u = 0\) if and only if \(2i^*\theta(u_2) = 0\). Suppose \(\delta^* u = 0\). Then \(u_2\) can be chosen to be a sum of terms each having a factor \(\delta(w_{2i_1} \cdots w_{2i_l})\), \(2i_1 \leq n - 3, \ldots\)

\[\delta(w_{2i_1} \cdots w_{2i_l})X_{n-1} = \delta(w_{2i_1} \cdots w_{2i_l}, \rho X_{n-1}) = \delta(w_{2i_1} \cdots w_{2i_l}, w_{n-1}) \in \text{image} \ i^* \theta\]

Hence \(u \in \text{image} \ i^*\). This completes the proof that \(\theta\) is an epimorphism.

Note the free part of \(\mathcal{R}_n/\mathcal{I}_n\), the subalgebra generated the \(p_i\), injects into \(H^*(BSO_{n-1})\) and the torsion part consists of elements of order two. Hence \(H^*(BSO_n)\) satisfies 2.2 and as above \(\theta(\mathcal{I}_n) = 0\).

It follows from 2.2 and 2.4 that to show that \(\theta\) is an isomorphism, it is sufficient to show that \(\rho \theta\) induces an isomorphism from the torsion of \(\mathcal{R}_n/\mathcal{I}_n\) onto \(\text{Sq}^1 H^*(BSO_n; \mathbb{Z}_2)\). Note:

\[H^*(BSO_n; \mathbb{Z}_2) = \mathbb{Z}_2[w_{2i}, \text{Sq}^1 w_{2j}[2i, 2j + 1 \leq n]]\]

If \(k = (k_1, \ldots, k_n)\) let

\[w^k = \prod w_{2i}^{k_2i_1} \prod (\delta w_{2j})^{k_{2j+1}}, \quad z^k = \prod p_i^{m_i} \prod (\delta w_{2j})^{k_{2j+1}+1} \delta(\prod w_{2i}^{k_i}) \quad \text{where} \quad k_{2i} = 2m_i + \epsilon_i,\]

License or copyright restrictions may apply to redistribution; see https://www.ams.org/journal-terms-of-use
\( \epsilon_i = 0 \) or \( 1 \). Then \( \rho \theta(z^k) = Sq^1 w^k \). Let \( U \) be the set of \( k \) with \( k_{2i} \) odd for some \( i \) and, if \( i_0 \) is the largest \( i \) with \( k_{2i} \) odd, then \( k_{2i+1} = 0 \) for \( j > i_0 \). One easily checks that \( z^k, k \in U \), span the torsion of \( H_n / I_n \) \((\sum \delta w(2I - i))\delta w_{2i} = 0 \). Also \( Sq^1 w^k, k \in U \), span \( Sq^1 H^*(BSO_n; \mathbb{Z}_2) \). If \( k \in U \) and \( i_0 \) is as above, let \( \overline{k} = k + (0, \ldots, -1, 1, 0, \ldots, 0) \) where \(-1\) is in the \( i_0 \) place. Note that \( \overline{k} \) determines \( k \). Then for \( k \in U \), \( Sq^1 w^k = w^\overline{k} \) modulo the subspace spanned by monomials \( w^k, \ k \notin U \). Hence \( \rho \theta(z^k), k \in U \), is a basis for \( Sq^1 H^*(BSO_n; \mathbb{Z}_2) \). Therefore \( \theta \) is an isomorphism.

**Proof of 1.6.** We first prove

**Lemma 2.4.** \( H^*(BO_n; \mathbb{Z}) = \mathbb{Z}[p_1, \ldots, p_{[n/2]}] \oplus T \) where \( T \) is a \( \mathbb{Z}_2 \) vector space.

**Proof.** Suppose \( n \) is odd. Let \( p: BSO_n \to BO_n \) be the covering map and let \( f: BO_n \to BO_1 \) correspond to \( \pi_1 (BO_1 = K(\mathbb{Z}_2, 1)) \). Since \( n \) is odd, \( \pi_n \otimes f^* \) is orientable. Let \( g: BO_n \to BSO_n \) classify \( \pi_n \otimes f^* \). Since \( gp \) is homotopic to the identity, \( g_\ast: \pi_i(BO_n) \approx \pi_i(BSO_n), i > 1 \). Also \( f_\ast: \pi_1(BO_n) \approx \pi_1(BO_1) \). Therefore \( g \times f: BO_n \to BSO_n \times BO_1 \) is a homotopy equivalence. Therefore

\[
p^*: H^*(BO_n; F) \approx H^*(BSO_n; F) \approx F[p_1, \ldots, p_{[n/2]}]
\]

for any field not of characteristic two.

\[ H^*(BO_n; \mathbb{Z}) \approx H^*(BSO_n \times BO_1; \mathbb{Z}) \approx H^*(BSO_n; H^*(BO_1; \mathbb{Z})) \]

\[ H^q(BO_1; \mathbb{Z}) \] is \( \mathbb{Z} \) when \( q = 0 \) and \( \mathbb{Z}_2 \) or \( 0 \) otherwise. Since the torsion of \( H^*(BSO_n) \) is a \( \mathbb{Z}_2 \) vector space, the same is true of \( H^*(BO_n; \mathbb{Z}) \). Lemma 2.4, for \( n \) odd now follows.

Suppose \( n \) is even. Let \( \tilde{V}_{n+1} \in H^{n+1}(BO_{n+1}, BO_n; \mathbb{Z}^t) \) be the Thom class where \( \mathbb{Z}^t \) denotes twisted integer coefficients. The Thom isomorphism yields an exact sequence:

\[
\begin{array}{c}
\to \ H^*(BO_{n+1}; \mathbb{Z}^t)
\to \\
\uparrow \rho
\end{array}
\]

\[
\begin{array}{c}
\to \ H^*(BO_{n+1}; Z)
\to \\
\uparrow \\
\downarrow
\end{array}
\]

\[
H^*(BO_{n+1}; Z_2)
\]

The map \( \rho \) is isomorphic to

\[
H^*(BSO_{n+1}; H^*(BO_1; \mathbb{Z}^t)) \to H^*(BSO_{n+1}; H^*(BO_1; Z_2))
\]

\( \rho: H^*(BO_1; \mathbb{Z}^t) \to H^*(BO_1; Z_2) \) is an injection. Hence \( \rho \) and \( \cup X_{n+1} \) in 2.5 are injections and therefore \( i^* \) is an epimorphism with kernel a \( \mathbb{Z}_2 \) vector space. This yields 2.4 for \( n \) even.

Let \( \theta: \mathcal{R}_n \to H^*(BO_n) \) be as before. As in the proof of 1.5, \( \rho \theta(I_n) = 0 \) and hence \( \theta(I_n) = 0 \). Also the same method used in 1.5, \( n \) odd, proves that \( \theta: \mathcal{R}_n / I_n \to H^*(BO_n) \) is an isomorphism.

Finally we determine how the \( p_i \)'s behave under Whitney sum. The complexification of the sum of two bundles is the sum of the complexifications. Hence we have a commutative diagram:

\[
\begin{array}{c}
BO_m \times BO_n \to \ BO_{n+m} \\
\downarrow \\
BU_m \times BU_n \to \ BU_{n+m}
\end{array}
\]

License or copyright restrictions may apply to redistribution; see https://www.ams.org/journal-terms-of-use
Thus
\[ p_i = (-1)^i c_{2i} (\hat{s}_n \otimes C) \to (-1)^i \sum c_{2i-j} (\hat{s}_m \otimes C) \otimes c_j (\hat{s}_n \otimes C) \]
and we must show that
\[ c_{2s+1} (\hat{s}_n \otimes C) = (\delta w_{2s})^2 + p_s \delta w_1. \]

Let \( r = c_{2s+1} (\hat{s}_n \otimes C) \). Since \( 2H^{4s+2} (BO_n) = 0 \), \( 2r = 0 \). Thus by 2.2 it is sufficient to obtain the above formula with coefficients reduced mod two.

\[ \rho r = w_{4s+2} (\hat{s}_n \otimes C) = w_{4s+2} (2\hat{s}_n) = w_{2s+1} (\hat{s}_n)^2; \]
\[ \rho ((\delta w_{2s})^2 + p_s \delta w_1) = (\text{Sq}^1 w_{2s})^2 + w_{2s}^2 w_1^2 \]
\[ = (w_{2s+1} + w_1 w_{2s})^2 + w_{2s}^2 w_1^2 = w_{2s+1}. \]

This completes the proof of 1.6.
