ON HEMINEARNESS SPACES
MARYAM SHAYEGAN HASTINGS

Abstract. The concept of nearness was introduced by H. Herrlich [4'], where nearness refers to collections of sets. Nearness spaces have proven to be an extremely useful generalization of a wide class of topological structures.

A category which contains NEAR as a subcategory is the category H-NEAR, of heminearness spaces. It arises naturally while studying products of nearness spaces. A nice embedding theorem further motivated us to make a detailed study of this category. H. Herrlich [4'] has described a process by which one can construct completions for nearness spaces. H-NEAR is the only supercategory of NEAR known to us where this process of completion can be imitated satisfactorily.

In §I we define heminearness, give some examples, describe initial, final, product, coproduct, subobject, quotient object, and completion for heminearness spaces.

In §II we introduce the concept of preclosure, semiclosure, and hemiclosure. We show that any heminearness space can be embedded as a subspace of a closure heminearness space.

I. Let $X$ be a set and $\xi \subseteq P^2X$ and consider the following axioms:
(N1) If $\emptyset \subseteq \xi$ and $\mathcal{A}$ corefines $\emptyset$ (i.e., for each $A \in \mathcal{A}$ there exists a $B \in \emptyset$ such that $B \subseteq A$) then $\mathcal{A} \subseteq \xi$.
(N2) If $\bigcap \mathcal{A} \neq \emptyset$, then $\mathcal{A} \subseteq \xi$.
(N3) $\emptyset \neq \xi \neq P^2X$.
(N4) If $\mathcal{A} \cup \emptyset = \{A \cup B | A \in \mathcal{A}, B \in \emptyset\} \subseteq \xi$, then $\mathcal{A} \subseteq \xi$ or $\emptyset \subseteq \xi$.
(N5) If $\text{Cl}_\xi \mathcal{A} \subseteq \xi$, then $\mathcal{A} \subseteq \xi$. ($\text{Cl}_\xi A = \{x \in X | \{(x), A\} \in \xi\}$ and $\text{Cl}_\xi \mathcal{A} = \{\text{Cl}_\xi A | A \in \mathcal{A}\}$.)

1. Definition [5]. $(X, \xi)$ is called a prenearness [seminearness, nearness] space if and only if $\xi$ satisfies (N1)--(N3) [(N1)--(N4), (N1)--(N5)]. These spaces were introduced by H. Herrlich [5].

2. Definition [5]. If $(X, \xi)$ and $(Y, \eta)$ are prenearness spaces, then a function $f: (X, \xi) \rightarrow (Y, \eta)$ is called a nearness-preserving map if and only if $\mathcal{A} \subseteq \xi$ implies that $f(\mathcal{A}) \subseteq \eta$.
We consider those spaces where $\xi$ satisfies (N1)–(N3) and (N5). We call them heminearness spaces; they were first introduced by Hunsaker and Sharma [9].

We will give some examples of heminearness spaces, and describe the relation between the category of heminearness spaces and the categories of prenearness spaces and nearness spaces. Initial, final, product, coproduct, subobjects, and quotient objects are described in the category of heminearness spaces. We also describe completions for heminearness spaces.

3. Examples. (a) Let $\mathbf{R}$ denote the reals and for each $A \subseteq \mathbf{R}$ define $\text{Cl} A = \text{convex hull of } A$. Let $\xi = \{ A \subseteq \mathbf{R} | \cap \text{Cl} A \neq \emptyset \}$. Then $\xi$ is a heminearness structure on $\mathbf{R}$ which is not a nearness structure. Note that if $A$ and $B$ are subsets of $\mathbf{R}$, $\text{Cl}(A \cup B) \neq \text{Cl} A \cup \text{Cl} B$ in general.

(b) Let $(\mathbf{R}, \xi)$ be defined as follows: Let $(\mathbf{R}, C_1)$ denote the reals with the usual topology and $\xi = \{ A \subseteq \mathbf{R} | \cap \text{Cl} A \neq \emptyset \}$, then $(\mathbf{R}, \xi)$ is a nearness space. Let $\eta = \{ A \subseteq \mathbf{R} \times \mathbf{R} | \text{Pr}_i A \in \xi \text{ for } i = 1, 2 \}$, where $\text{Pr}_i : \mathbf{R} \times \mathbf{R} \to \mathbf{R}$ is the canonical projection for $i = 1, 2$. Then $\eta$ is a heminearness structure on $\mathbf{R} \times \mathbf{R}$ which is not a nearness structure. In particular, if $A$ and $B$ are subsets of $\mathbf{R} \times \mathbf{R}$, $\text{Cl}(A \cup B) \neq \text{Cl} A \cup \text{Cl} B$ in general.

The category of prenearness [seminearness, heminearness, nearness] spaces and nearness preserving maps is called $P$-NEAR [$S$-NEAR, $H$-NEAR, NEAR].

4. Theorem. NEAR is a bicoreflective subcategory of $H$-NEAR. For any heminearness space $(X, \xi)$, the map $1_X : (X, \xi_s) \to (X, \xi)$ is the NEAR coreflection of $(X, \xi)$ where $\xi_s$ is defined as in [5] as follows: $A \in \xi_s$ if and only if there exists $A_1, \ldots, A_n \notin \xi$ such that $A = \bigvee A_i$ corefines $\xi$.

5. Theorem. $H$-NEAR is a bifreflective subcategory of $P$-NEAR. For any $P$-Near space $(X, \xi)$, the map $1_X : (X, \xi) \to (X, \xi_n)$ is the $H$-NEAR biflection of $(X, \xi)$, where $\xi_n$ is defined as in [5] as follows:

(1) $\text{Cl}^{0} A = A$.
(2) $\text{Cl}^{\alpha + 1} A = \{ x \in X | \{ \text{Cl}^\alpha A, \text{Cl}^\alpha \{ x \} \} \in \xi \}$.
(3) $\text{Cl}^\beta A = \bigcup \{ \text{Cl}^\alpha A | \alpha < \beta \}$ if $\beta$ is a limit ordinal. $\text{Cl} A = \bigcup \{ \text{Cl}^\alpha A | \alpha$ is an ordinal $\}$. $\xi_n = \{ A \subseteq PX | \{ \text{Cl} A | A \in \mathcal{A} \} \in \xi \}$.

**Proof.** Observe that if $\alpha$ is an ordinal greater than or equal to the cardinal of $X$, then $\text{Cl} A = \text{Cl}^\alpha A$ for each $A \subseteq X$.

6. Theorem. For any set $X$, the set of all heminearness structures on $X$ is a complete lattice with respect to inclusion. Especially

(1) The discrete nearness $= \{ A \subseteq PX | \cap A \neq \emptyset \}$ is the smallest element.
(2) The indiscrete nearness $= \{ A \subseteq PX | \emptyset \notin A \}$ is the largest element.
(3) If $\Omega$ is a set of heminearness structures on $X$, $\inf \Omega = \cap \Omega$ and $\sup \Omega = (\cup \Omega)_n$.

7. Proposition. If $X$ is a set, $(X_i, \xi_i)_{i \in I}$ a family of heminearness spaces, then

(1) If $(f_i : X_i \to X_i)_{i \in I}$ is a family of maps, $\xi = \cap \{ f_i^{-1}(\xi_i) | i \in I \}$ is a heminearness structure on $X$ initial with respect to $(X, f_i(X_i, \xi_i))_{i \in I}$, where $f_i^{-1}(\xi_i) = \{ A \subseteq PX | f_i \not\in \xi_i \in \xi \}$ for each $i \in I$.

(2) If $(f_i : X_i \to X_i)_{i \in I}$ is a family of maps,

$$\xi = \{ \{ A \subseteq PX | \cap A \neq \emptyset \} \cup \bigcup \{ f_i(\xi_i) | i \in I \} \}_{n}$$
is a heminearness structure on \( X \) final with respect to \( ((X_i, \xi_i), f_i, X)_i \in I \) where \( f_i(\xi_i) = \{ \mathbb{A} \subset PX \mid f_i^{-1}\mathbb{A} \in \xi_i \} \) for each \( i \in I \).

8. **Corollary.** \( H\text{-NEAR} \) is a properly fibred topological category.

9. **Remark.** For definitions of subspace, quotient space, product, coproduct see Hastings [4].

10. **Proposition.** Let \((X, \xi)\) and \((Y, \eta)\) be heminearness spaces, then
   (1) \((X, \xi)\) is a subspace of \((Y, \eta)\) if and only if there exists an injection \( f:\ (X, \xi) \to (Y, \eta) \) such that \( \mathbb{A} \in \xi \) if and only if \( f(\mathbb{A}) \in \eta \).
   (2) \((Y, \eta)\) is a quotient space of \((X, \xi)\) if and only if there exists a surjection \( f:\ (X, \xi) \to (Y, \eta) \) such that \( \mathbb{A} \in \eta \) if and only if \( f^{-1}\mathbb{A} \in \xi \).

11. **Proposition.** Let \((X_i, \xi_i)\) be a family of heminearness spaces then
   (1) \((\prod\limits_{i \in I} X_i, \xi)\) is the product of this family in \( H\text{-NEAR} \) if and only if \( \xi = \{ \mathbb{A} \subset P(\prod\limits_{i \in I} X_i) \mid Pr_i\mathbb{A} \in \xi_i \) for each \( i \in I \} \).
   (2) \((\prod\limits_{i \in I} X_i, \xi)\) is the coproduct of this family in \( H\text{-NEAR} \) if and only if \( \xi = \{ \mathbb{A} \subset P(\prod\limits_{i \in I} X_i) \mid inj_i^{-1}\mathbb{A} \in \xi_i \) for some \( i \in I \} \).

**Proof.** (1) \( \xi \) is initial with respect to \((\prod\limits_{i \in I} X_i, pr_i, (X_i, \xi_i)_{i \in I}) \) if and only if

\[
\xi = \bigcap \{ Pr_i^{-1}(\xi_i) \mid i \in I \} = \left\{ \mathbb{A} \subset P\left( \prod\limits_{i \in I} X_i \right) \mid Pr_i\mathbb{A} \in \xi_i \) for each \( i \in I \} \right. \}
\]

(2) \( \xi \) is final with respect to \((X_i, \xi_i), inj_i, \prod\limits_{i \in I} X_i) \) if and only if

\[
\xi = \left( \bigcup \{ inj_i(\xi_i) \mid i \in I \} \cup \left( \mathbb{A} \subset P\left( \prod\limits_{i \in I} X_i \right) \mid \bigcap \mathbb{A} \neq \emptyset \} \right) \right) \bigcap \bigcap \{ inj_i^{-1}\mathbb{A} \in \xi_i \) for some \( i \in I \} \right). \}
\]

Let \( \beta = \{ \mathbb{A} \subset P(\prod\limits_{i \in I} X_i) \mid inj^{-1}\mathbb{A} \in \xi_i \) for some \( i \in I \} \). We claim that \( \xi = \beta \). Suppose \( Cl_{\beta} \mathbb{A} \in \beta \). Then for some \( i \in I \), \( inj^{-1}(Cl_{\beta} \mathbb{A}) \in \xi_i \). \( inj_i(X_i) \cap inj_j(X_k) = \emptyset \) for each pair \((j, k), j \neq k \) implies that \( inj_j^{-1}(Cl_{\xi_j} \mathbb{A}) = Cl_{\xi_j}(inj_j^{-1}\mathbb{A}) \). Therefore, \( inj_j^{-1}\mathbb{A} \in \xi_j \) which implies that \( \mathbb{A} \in \beta \).

12. **Proposition.** Suppose \((X, \xi)\) and \((Y, \eta)\) are heminearness \([\text{prinearness}]\) spaces and \( f:\ (X, \xi) \to (Y, \eta) \) is an embedding. Then \( f:\ (X, \xi_s) \to (Y, \eta_s) \) is an embedding of the nearness \([\text{seminearness}]\) space \((X, \xi_s)\) into \((Y, \eta_s)\).

13. **Proposition.** Let \((X_i, \beta_i)_{i \in I}\) be a family of heminearness spaces and let \( \xi_i = (\beta_i)\), for each \( i \in I \). Let \((\prod\limits_{i \in I} X_i, \xi)\) be the product of \((X_i, \xi_i)_{i \in I}\) in \( NEAR \) and \((\prod\limits_{i \in I} X_i, \beta)\) the product of \((X_i, \beta_i)_{i \in I}\) in \( H\text{-NEAR} \). Then \( \beta_s = \xi_s \).

**Proof.** \((\prod\limits_{i \in I} \xi_i)\) is the product of \((X_i, \xi_i)_{i \in I}\) in \( NEAR \) means \( \xi = \eta \), where \( \eta = \{ \mathbb{A} \subset P(\prod\limits_{i \in I} X_i) \mid Pr_i\mathbb{A} \in \xi_i \) for each \( i \in I \} \). \((\prod\limits_{i \in I} X_i, \beta)\) is the product of \((X_i, \beta_i)_{i \in I}\) in \( H\text{-NEAR} \) means \( \beta = \{ \mathbb{A} \subset P(\prod\limits_{i \in I} X_i) \mid Pr_i\mathbb{A} \in \beta_i \) for each \( i \in I \} \). If \( \mathbb{A} \in \xi \), then there exists \( \mathbb{A}_1, \ldots, \mathbb{A}_n \notin \eta \) such that \( \mathbb{A}_1 \lor \cdots \lor \mathbb{A}_n \) corefines \( \mathbb{A} \) which implies that for each \( 1 \leq i \leq n \) there exists \( j_i \) and \( \mathbb{C}_i^{j_i}, \ldots, \mathbb{C}_i^{m_i} \in \beta_j \) such that \( \mathbb{C}_i^{j_i} \lor \cdots \lor \mathbb{C}_i^{m_i} \) corefines \( Pr_j \mathbb{A}_i \). Therefore, \( Pr_j^{-1}\mathbb{C}_i^{j_i} \in \beta \) for each \( 1 \leq i \leq n \) and for each \( 1 \leq q \leq m_i \), \( \mathbb{C}_q \) corefines \( Pr_j^{-1}\mathbb{C}_q^{j_i} \).
14. Remark. H. Herrlich [5] developed a method by which one can construct completions for nearness spaces. Here we imitate the terminology and the construction in order to build completions for heminearness spaces. \textit{H-NEAR} is the only category containing \textit{NEAR} known to us where the process of completion can be imitated satisfactorily.

15. Definition. Let \((X, \xi)\) be a heminearness space. The maximal elements of the set \(\xi - \{\emptyset\}\), ordered by inclusion are called \(\xi\)-clusters. A \(\xi\)-cluster \(\mathcal{A}\) is called a point \(\xi\)-cluster if and only if there exists \(x \in X\) with \(\{x\} \in \mathcal{A}\).

16. Note. If \((X, \xi)\) is a nearness space then a \(\xi\)-cluster is always a grill in a sense of Chouquet [3], i.e., \(A \cup B \in \mathcal{A}\) if and only if \(A \in \mathcal{A}\) or \(B \in \mathcal{A}\). But a \(\xi\)-cluster in a heminearness space generally fails to be a grill.

Example. Let \((\mathbb{R}, \xi)\) be a heminearness space defined as in Example 3(a) and let \(x \in \mathbb{R}\). Then \(e(x) = \{A \subseteq \mathbb{R} | x \in \text{Cl} A\}\) is a \(\xi\)-cluster. Let \(a < x < b\) and \(A = (-\infty, a), B = (b, \infty)\). Then \(A \cup B \in e(x)\), but \(A \notin e(x)\) and \(B \notin e(x)\).

17. Proposition. If \((X, \xi)\) is a heminearness space and if \(x \in X\), then \(e(x) = \{A \subseteq X | x \in \text{Cl}_\xi A\}\) is a point \(\xi\)-cluster. Conversely, any point \(\xi\)-cluster is of this form.

18. Definition. A heminearness space is called complete if and only if every \(\xi\)-cluster is a point \(\xi\)-cluster.

19. Definition. A prenearness space \((X, \xi)\) is called a T1-prenearness space if and only if for any pair of elements \((x, y)\) of \(X\), if \(\{(x), (y)\} \in \xi\) then \(x = y\).

20. Theorem. Let \((X, \xi)\) be a heminearness space, let \(X^*\) be the set of all \(\xi\)-clusters, let \(\xi^*\) be the set of all \(\Omega \subseteq PX^*\) with \((\bigcup \{\text{Cl}_\xi A | A \in \Omega\}) \in \xi\) and let \(f: X \rightarrow X^*\) be the function which maps each \(x \in X\) to the point \(\xi\)-cluster \(e(x)\). Then the following hold:

\begin{enumerate}
\item \((X^*, \xi^*)\) is a complete T1-heminearness space.
\item \(f: (X, \xi) \rightarrow (X^*, \xi^*)\) is a nearness preserving map.
\end{enumerate}

Moreover the following hold:
\begin{enumerate}
\item \(\mathcal{A} \in \xi\) if and only if \(f\mathcal{A} \in \xi^*\).
\item \(\text{Cl}_{\xi^*} fX = X^*\).
\item \(f\) is injective if and only if \((X, \xi)\) is a T1-heminearness space.
\item \(f\) is surjective if and only if \((X, \xi)\) is complete.
\end{enumerate}

21. Remark. The above construction \(f: (X, \xi) \rightarrow (X^*, \xi^*)\) is called the completion of \((X, \xi)\).

The proof of Theorem 20 is similar to that of Theorem 5.7 of [4] and will therefore be omitted.

\textit{Note.} To show that \(f: X \rightarrow X^*\) is nearness preserving, we need axiom (N5). This process of completion cannot be imitated for \textit{P-NEAR} or \textit{S-NEAR}.

Proof of Note. If \(\mathcal{A} \in \xi\) and \(B \in \bigcup \{\text{Cl}_\xi A | A \in f(\mathcal{A})\}\), then \(B \in \bigcap A\) for some \(A \in \mathcal{A}\) which implies that \(A \subseteq \text{Cl}_\xi B\). Therefore by (N1) \(\text{Cl}_{\xi^*} \bigcup \{\text{Cl}_\xi A | A \in f(\mathcal{A})\}\) \(\in \xi\) and by (N5) \(\bigcup \{\text{Cl}_\xi A | A \in f(\mathcal{A})\} \in \xi\), i.e., \(f\mathcal{A} \in \xi^*\).

II. Closure heminearness spaces. We will now introduce the concept of preclosure, semiclosure, and hemiclosure, and define the category \textit{C-H-NEAR} of closure heminearness spaces. We prove that \textit{C-H-NEAR} is bicoreflective in \textit{H-NEAR} and is isomorphic to the category of hemiclosure spaces and continuous functions.
In the 1973 Categorical Topology Conference at Southern Illinois University in Carbondale, H. Herrlich [7] posed the following question: how far removed is NEAR from TOP? The analogous question in the category of heminearness spaces is: how far removed is C-H-NEAR from H-NEAR? We will show that any heminearness space is a subspace of some closure heminearness space. Our method can also be used to obtain analogous results in $P$-NEAR. For the case of $S$-NEAR we proved [4] that any seminearness space can be embedded as a subspace of a product of grill-determined spaces.

22. Definitions. Let $X$ be a set. $Cl$ an operator on $X$ and consider the following axioms. For any pair $(x, y)$ of elements of $X$ and for any pair $(A, B)$ of subsets of $X$:

(0) If $x \in Cl\{y\}$, then $y \in Cl\{x\}$.
(1) $Cl \emptyset = \emptyset$.
(2) $A \subset Cl A$.
(3) If $A \subset B$, then $Cl A \subset Cl B$.
(4) $Cl(A \cup B) = Cl A \cup Cl B$.
(5) $Cl Cl A = Cl A$.

$(X, Cl)$ is called a preclosure [semiclosure, hemiclosure, topological] space if and only if $Cl$ satisfies axioms (0)–(3) [(0)–(4), (0)–(3) and (5), (0)–(5)].

If $(X, Cl_X)$ and $(Y, Cl_Y)$ are preclosure spaces, then a function $f: (X, Cl_X) \to (Y, Cl_Y)$ is called continuous if and only if $f(Cl_X A) \subset Cl_Y fA$ for each $A \subset X$.

The category of preclosure [semiclosure, hemiclosure, topological] spaces and continuous functions is called $P$-CLOS [$S$-CLOS, $H$-CLOS, TOP]. Throughout this paper we require that topological spaces satisfy the symmetry axiom (0) above.

22'. Remark. $S$-CLOS has been studied by E. Čech [2].

23. Definition. A heminearness space $(X, \xi)$ is called a closure heminearness space if and only if it satisfies the following condition:

(c) if $91 \in \xi$ then $n Cl 91 \neq \emptyset$.

Note that this condition is equivalent to

(c') $\forall \in \xi$ if and only if $\cap Cl_\xi \neq \emptyset$.

24. Theorem. The full subcategory $C$-$H$-NEAR of $H$-NEAR whose objects are closure heminearness spaces is:

(a) bioreflective in $H$-NEAR. $1_X: (X, \xi_x) \to (X, \xi)$ is the $C$-$H$-NEAR coreflection, where $\xi_x = \{\forall \subset P(X) | \cap Cl_\xi \forall \neq \emptyset \}$.

(b) isomorphic to the category $H$-CLOS of hemiclosure spaces and continuous functions. $F: C$-$H$-NEAR $\to H$-CLOS is an isomorphism, where $F(X, \xi) = (X, Cl_\xi)$.

25. Proposition. If $(X_i, \xi_i)_{i \in I}$ is a family of heminearness spaces, then $(X_i, \xi_i)_{i \in I}$ is a family of closure heminearness spaces if and only if $(\Pi_{i \in I} X_i, \xi)$, the product of this family in $H$-NEAR is a closure heminearness space.

Proof. Let $\forall \in \xi$, then for each $i \in I$ there exists $x_i \in \cap Cl_\xi \forall$. Let $x \in \Pi_{i \in I} X_i$ such that $Pr_i x = x_i$ for each $i \in I$, then $x \in \cap Cl_\xi \forall \neq \emptyset$. Suppose there exists $i \in I$ such that $(X_i, \xi_i)$ is not a closure heminearness space, i.e., there exists
\( \mathcal{A} \in \xi \), such that \( \cap \text{Cl}_\xi \mathcal{A} = \emptyset \). For each \( A \in \mathcal{A} \) let \( B_A \subset \Pi_{i \in I} X_i \) such that \( Pr_j B_A = A \) and \( Pr_j B_A = X_j \) for \( j \neq i, j \in I \). Let \( \mathcal{E} = \{ B_A | A \in \mathcal{A} \} \), then \( \mathcal{E} \in \xi \) and \( \cap \text{Cl}_\xi \mathcal{E} = \emptyset \). Therefore, \( (\Pi_{i \in I} X_i, \xi) \) is not a closure heminearness space.

26. Theorem. Any heminearness space can be embedded as a subspace of a closure heminearness space.

Proof. Let \( (X, \xi) \) be a heminearness space. Let \( \alpha = \{ \mathcal{A} \in \xi | \cap \text{Cl}_\xi \mathcal{A} \neq \emptyset, \mathcal{A} \) is a stack (i.e., if \( A \in \mathcal{A} \) and \( A \subset B \) then \( B \in \mathcal{A} \) and \( \text{Cl}_\xi A \in \mathcal{A} \) implies that \( A \in \mathcal{A} \}) \). For each \( \mathcal{A} \in \alpha \), adjoin \( x_\mathcal{A} \) to \( X \), i.e., let \( X' = X \cup \{ x_\mathcal{A} | \mathcal{A} \in \alpha \} \). For each \( A \subset X' \) define \( \text{Cl}_\xi A = A \cup \text{Cl}_\xi (A \cap X) \cup \{ x_\mathcal{A} | \mathcal{A} \in \alpha \) and \( A \cap X \in \mathcal{A} \} \). We claim that \( (X', \text{Cl}) \) is a hemiclosure space. The only nontrivial fact in establishing this claim is that \( \text{Cl} \text{Cl} A \subset \text{Cl} A \) for any \( A \subset X' \).

Let \( x \in \text{Cl} (\text{Cl} A = \text{Cl} A \cup \text{Cl}_\xi (A \cap X)) \cup \{ x_\mathcal{A} | \mathcal{A} \in \alpha \) and \( (\text{Cl} A) \cap X \in \mathcal{A} \} \). Since \( (\text{Cl} A) \cap X = \text{Cl}_\xi (A \cap X) \) one of the following must hold:

1. \( x \in \text{Cl} A \).
2. \( x \in \text{Cl}_\xi (\text{Cl}_\xi (A \cap X)) = \text{Cl}_\xi (A \cap X) \subset \text{Cl} A \), i.e., \( x \in \text{Cl} A \).
3. \( x = x_\mathcal{A} \), where \( \mathcal{A} \in \alpha \) and \( \text{Cl}_\xi (A \cap X) \in \mathcal{A} \) which implies that \( A \cap X \in \mathcal{A} \), i.e., \( x \in \{ x_\mathcal{A} | \mathcal{A} \in \alpha \) and \( A \cap X \in \mathcal{A} \} \subset \text{Cl} A \), i.e., \( x \in \text{Cl} A \). This completes the proof of \( \text{Cl} \text{Cl} A \subset \text{Cl} A \) for any \( A \subset X' \). Define \( \xi' = \{ \mathcal{A} \subset P(X') | \text{Cl} \mathcal{A} \neq \emptyset \} \), then \( \text{Cl}_{\xi'} A = \text{Cl} A \) for each \( A \subset X' \) and \( (X', \xi') \) is a heminearness space. Now, \( \mathcal{A} \in \xi' \) if and only if \( \cap \text{Cl} \mathcal{A} = \cap \text{Cl}_\xi \mathcal{A} \neq \emptyset \) which implies that \( (X', \xi') \) is a closure heminearness space. We claim that the inclusion map \( i: (X, \xi) \to (X', \xi') \) is an embedding. In establishing this claim we will only give the details in the proof of the case where \( \mathcal{A} \in \xi \) and \( \cap \text{Cl}_\xi \mathcal{A} = \emptyset \). In this case let \( \mathcal{E} = \{ B \subset X \} \) where there exists \( A \in \mathcal{A} \) such that \( \text{Cl}_\xi A \subset \text{Cl}_\xi B \). Then \( \mathcal{A} \subset \mathcal{E} \) and \( \mathcal{E} \in \alpha \) which implies that \( x_\mathcal{E} \in \cap \text{Cl}_\xi \mathcal{E} \subset \text{Cl}_\xi \mathcal{A} \neq \emptyset \) and so \( i(\mathcal{A}) = \mathcal{A} \in \xi' \).

27. Remark. The construction used in this theorem results in a dense embedding, i.e., \( \text{Cl}_\xi X = X' \).

30. Corollary. The epireflective hull of C-H-NEAR in H-NEAR is H-NEAR.

31. Corollary. Any nearness space can be embedded as a subspace of a nearness space \( (X', \beta) \) where \((X', \beta)\) is a closure heminearness space.

We now bring together the results of §§I and II.

32. Proposition. Each closure heminearness space is complete.
