WEIGHTED INTEGRABILITY
OF DOUBLE TRIGONOMETRIC SERIES

CHANG-PAO CHEN AND XIN-RONG HUANG

(Communicated by Christopher D. Sogge)

Abstract. We study the double trigonometric series whose coefficients $c_{jk}$ are such that
\[ \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} |c_{jk}| < \infty. \]
Then its rectangular partial sums converge uniformly to some $f \in C(T^2)$. We give sufficient conditions for the
Lebesgue integrability of $\{ f(x, y) - f(x, 0) - f(0, y) + f(0, 0) \} \phi(x, y)$, where
$\phi(x, y) = 1/xy, 1/x,$ or $1/y$. For certain cases, they are also necessary condi-
tions. Our results extend those of Boas and Móricz from the one-dimensional
to the two-dimensional series.

1. Introduction

Let $T^2 \equiv [-\pi, \pi] \times [-\pi, \pi]$. Denote by $s_{mn}(x, y)$ the rectangular partial sums
of the double trigonometric series
\[ (1.1) \quad \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} c_{jk} \varepsilon^{jx+ky}, \]
where
\[ (1.2) \quad \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} |c_{jk}| < \infty. \]
The Weierstrass M-test theorem implies that $s_{mn}(x, y)$ converges uniformly to some
$f \in C(T^2)$ as $\min(m, n) \to \infty$. In [C1], the first author considered the following
two conditions:
\[ (1.3) \quad c_{jk} \to 0 \quad \text{as} \quad \max(|j|, |k|) \to \infty, \]
\[ (1.4) \quad \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} (|j|)^{\alpha} (|k|)^{\beta} \Delta_{11} c_{jk} < \infty, \]
where $\xi^{\top} = \max(\xi, 1), 0 < \alpha, \beta < 1,$ and
\[ \Delta_{pq} c_{jk} = \sum_{s=0}^{p} \sum_{t=0}^{q} (-1)^{s+t} \binom{p}{s} \binom{q}{t} c_{j+s, k+t}. \]
Obviously, (1.2) implies (1.3). He proved that

Theorem A (Chen [C1]). Let $0 < \alpha, \beta < 1$. Assume that conditions (1.3) and (1.4) are satisfied. Then $|x|^{-\alpha}|y|^{-\beta}|f(x, y)| \in L^1(T^2)$ and
\[
\int_{T^2} |s_{mn}(x, y) - f(x, y)|(|x|^{-\alpha}|y|^{-\beta}) \, dxdy \to 0 \quad \text{as} \quad \min(m, n) \to \infty.
\]

This result extends and generalizes [B3, Theorems 4.1 & 4.2] and [Ma, Theorem 4]. Conditions (1.3), (1.4) imply
\[
\sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} \left( |j|^{-\alpha} |k|^{-\beta} |c_{jk}| \right) < \infty.
\]
This is equivalent for the case when $\Delta_{11} c_{jk} \geq 0$ for $-\infty < j, k < \infty$. Obviously, (1.5) reduces to (1.2) for the case $\alpha = \beta = 1$. It is excluded in Theorem A. For this case, it is known that $x^{-1}y^{-1}f(x, y)$ may not be Lebesgue integrable on $T^2$. Instead of Lebesgue integrability, the improper Riemann integrability of $x^{-1}y^{-1}f(x, y)$, or more generally, $f(x, y)\phi(x, y)$ was examined by the first author in [C2]. His results extend and generalize [Ba], [B1], [M2], [M3]. As for the Lebesgue integrability of $x^{-1}y^{-1}f(x, y)$, several known results have been given by Boas [B2], [B3] and Móricz [M4] for the one-dimensional case, and by Brown-Wang [BW], Móricz [M1], and Papp [P] for higher dimensions. In [P], Papp proved

Theorem B (Papp [P]). Let (1.1) be a double cosine series. Assume that the following three conditions are satisfied for some $p > 1$:
\[
\sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \left\{ \sum_{2^{m-1} \leq j < 2^m} \sum_{2^{n-1} \leq k < 2^n} (jk)^{p-1} |c_{jk}|^p \right\}^{1/p} < \infty,
\]
\[
\sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \frac{1}{n} \left\{ \sum_{2^{m-1} \leq j < 2^m} \sum_{k=n}^{\infty} (j)^{p-1} |c_{jk}|^p \right\}^{1/p} < \infty,
\]
\[
\sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \frac{1}{m} \left\{ \sum_{2^{n-1} \leq k < 2^n} \sum_{j=m}^{\infty} (j)^{p-1} |c_{jk}|^p \right\}^{1/p} < \infty.
\]

Then the quotient
\[
\frac{f(x, y) - f(x, 0) - f(0, y) + f(0, 0)}{xy} \in L^1(T^2)
\]
if and only if
\[
\sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \frac{1}{mn} \left| \sum_{j=m}^{\infty} \sum_{k=n}^{\infty} c_{jk} \right| < \infty.
\]

Papp also derived analogous results for double sine series and double cosine-sine series. His results extend [M4, Theorems 1 & 2] from the one-dimensional to two-dimensional series. In Papp’s results, condition (1.6) with $p > 1$ is involved. For the limiting case $p = 1$, condition (1.6) is transformed into
\[
\sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} |c_{jk}|(\ln |j|)^{\top} (\ln |k|)^{\top} < \infty.
\]
The results in this direction for the one-dimensional case were given by Boas [B3] and Móricz [M4]. As for the higher-dimensional case, it is still unknown. The purpose of this paper is to extend Boas’s and Móricz’s results from the one-dimensional
to two-dimensional series. We shall prove that condition (1.10) is sufficient to guarantee the validity of (1.9), (see Theorem 2.1). Obviously, the Lebesgue dominated convergence theorem tells us that (1.9) implies the truth of the following assertion:

\[
\lim_{\epsilon, \delta \downarrow 0} \int_{\delta}^{\epsilon} \int_{\epsilon}^{\pi} \frac{f(x, y) - f(x, 0) - f(0, y) + f(0, 0)}{xy} \, dx \, dy \quad \text{exists.}
\]

Under certain weaker conditions than (1.10), it will be proved that (1.9), (1.10), and (1.11) are equivalent, (see Corollary 2.6). In this paper, the Lebesgue integrability of \( x^{-1} \{f(x, y) - f(x, 0) - f(0, y) + f(0, 0)\} \) is also discussed, (see Theorem 2.3 and Corollary 2.8). For details, we refer the reader to the next two sections.

2. Main results

We first consider the two-dimensional extension of [M4], that is, the Lebesgue integrability of \( x^{-1}y^{-1}f(x, y) \) will be examined.

**Theorem 2.1.** Let \( f \) be the limiting function of series (1.1). If condition (1.10) is satisfied, then \( f \) is continuous on \( T^2 \), the assertion (1.9) holds, and

\[
\int\int_{T^2} \left| \frac{f(x, y) - f(x, 0) - f(0, y) + f(0, 0)}{xy} \right| \, dx \, dy 
\leq (2\pi + 4)^2 \left\{ \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} |c_{jk}| (\ln |j|)^T (\ln |k|)^T \right\}.
\]

Theorem 2.1 is the two-dimensional extension of [M4, Theorem 4 & Corollary 3]. It still holds if we replace (1.10) by (1.3) and (2.2):

\[
\sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} |\Delta_{11} c_{jk}| \left\{ \sum_{u=0}^{\infty} (\ln u)^T \left\{ \sum_{v=0}^{\infty} (\ln v)^T \right\} \right\} < \infty.
\]

This follows from the Fubini theorem. For double sine series whose coefficients satisfy (1.2), the assertion (1.9) reduces to \( x^{-1}y^{-1}f(x, y) \in L^1(T^2) \). In this case, the conclusions of Theorem 2.1 can be strengthened in the following way.

**Corollary 2.2.** Assume that series (1.1) is a double sine series and \( f \) is its limiting function. If condition (1.10) is satisfied, then \( f \) is continuous on \( T^2 \), \( x^{-1}y^{-1}f(x, y) \in L^1(T^2) \), and

\[
\int\int_{T^2} \left| s_{mn}(x, y) - f(x, y) \right| \, dx \, dy = o(1) \quad \text{as} \quad \min(m, n) \to \infty.
\]

Next, we consider the Lebesgue integrability of \( x^{-1}f(x, y) \). In this case, condition (1.10) will be replaced by the following condition:

\[
\sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} |c_{jk}| (\ln |j|)^T < \infty.
\]

**Theorem 2.3.** Let \( f \) be the limiting function of series (1.1). If condition (2.3) is satisfied, then \( f \) is continuous on \( T^2 \), and

\[
x^{-1}\{f(x, y) - f(x, 0) - f(0, y) + f(0, 0)\} \in L^1(T^2), \quad x^{-1}\{f(x, y) - f(0, y)\} \in L^1(T^2).
\]
Moreover, we have
\begin{align}
\int \int_{T^2} \left| \frac{f(x, y) - f(x, 0) - f(0, y) + f(0, 0)}{x} \right| \, dx \, dy & \leq (8\pi^2 + 16\pi) \left\{ \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} |c_{jk}|(\ln |j|)^\top \right\}, \\
\int \int_{T^2} \left| \frac{f(x, y) - f(0, y)}{x} \right| \, dx \, dy & \leq (2\pi + 4) \{ \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} |c_{jk}|(\ln |j|)^\top \} \quad (y \in T) .
\end{align}

Theorem 2.3 remains true if we replace (2.3) by (1.3) and (2.8):
\begin{align}
&\sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} \left| \Delta_{10} c_{jk} \right| \left\{ \sum_{n=0}^{\infty} (\ln u)^\top \right\} < \infty .
\end{align}

For those double trigonometric series with the property that
\begin{align}
c_{-j,k} = -c_{jk} \quad (-\infty < j, k < \infty),
\end{align}
the assertions (2.4) and (2.5) reduce to \(x^{-1} \{ f(x, y) - f(x, 0) \} \in L^1(T^2)\) and \(x^{-1} f(x, y) \in L^1(T^2)\), respectively. In this case, we have

**Corollary 2.4.** Assume that conditions (2.3) and (2.9) are satisfied. Then the limiting function \(f\) of series (1.1) is continuous on \(T^2\). Moreover, \(x^{-1} f(x, 0) \in L^1(T),\) \(x^{-1} f(x, y) \in L^1(T^2)\), and
\begin{align}
\int \int_{T^2} \frac{s_{mn}(x, y) - f(x, y)}{x} \, dx \, dy = o(1) \quad \text{as} \quad \min(m, n) \to \infty .
\end{align}

Obviously, condition (2.9) is satisfied by the double sine-cosine series, the double sine series, and the series \(\sum_{j=-1}^{\infty} \sum_{k=-\infty}^{\infty} c_{jk}(\sin jx)e^{iky}\). Therefore, Corollary 2.4 will apply to these double series.

Finally, we give the two-dimensional extension of [B3, Theorem 5.32]. The next theorem provides us with the converse of Theorem 2.1.

**Theorem 2.5.** Assume that (1.2) holds and that there exists some positive integer \(N_0\) such that
\begin{align}
c_{jk} & \geq 0 \quad \text{for} \quad \min(|j|, |k|) \geq N_0 , \\
\sum_{j=-\infty}^{\infty} |c_{jk}|(\ln |j|)^\top & < \infty \quad (|k| \leq N_0), \\
\sum_{k=-\infty}^{\infty} |c_{jk}|(\ln |k|)^\top & < \infty \quad (|j| \leq N_0).
\end{align}

Then (1.9) \(\implies\) (1.11) \(\implies\) (1.10).

Putting Theorems 2.1 and 2.5 together, we get the following result, which extends [B3, Theorem 5.32] from the one-dimensional to the two-dimensional series.

**Corollary 2.6.** Under the conditions (1.2) and (2.10)–(2.12), the assertions (1.9), (1.10), and (1.11) are equivalent.
Obviously, (2.4) implies the truth of the following assertion:

\begin{equation}
(2.13) \quad \lim_{\epsilon, \delta \to 0} \int_{-\epsilon}^{\epsilon} \int_{-\delta}^{\delta} \frac{f(x, y) - f(x, 0) - f(0, y) + f(0, 0)}{x} \, dx \, dy \quad \text{exists.}
\end{equation}

The following two results give another type of two-dimensional extensions of [B3, Theorem 5.32]. Corollary 2.8 can be derived from Theorems 2.3 and 2.7.

**Theorem 2.7.** Assume that (1.2) and (2.10) – (2.11) are satisfied by some positive integer \( N_0 \). Then (2.4) \( \implies \) (2.13) \( \implies \) (2.3).

**Corollary 2.8.** Under the conditions (1.2) and (2.10) – (2.11), the assertions (2.3), (2.4), and (2.13) are equivalent.

### 3. Proofs of main results

To derive the main results, the following lemma plays an important role. We leave its proof to the reader.

**Lemma 3.1.** For \( j \neq 0 \), we have

(i) \[
2 \ln |j| \leq \int_{\mathbb{T}} \left| \frac{e^{ijx} - 1}{x} \right| \, dx \leq (2\pi + 4)(\ln |j|)^\top,
\]

(ii) \[
\ln |j| \leq \int_{0}^{\pi} \frac{1 - \cos jx}{x} \, dx \leq (\pi + 2)(\ln |j|)^\top.
\]

**Proof of Theorem 2.1.** The Weierstrass M-test theorem implies that the limiting function \( f \) is continuous on \( \mathbb{T}^2 \). By (1.10) and Lemma 3.1, we obtain

\[
\begin{align*}
\int \int_{\mathbb{T}^2} \left| \frac{f(x, y) - f(x, 0) - f(0, y) + f(0, 0)}{xy} \right| \, dx \, dy \\
\leq \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} |c_{jk}| \left\{ \int_{\mathbb{T}} \left| \frac{e^{ijx} - 1}{x} \right| \, dx \right\} \left\{ \int_{\mathbb{T}} \left| \frac{e^{iky} - 1}{y} \right| \, dy \right\} \\
\leq (2\pi + 4)^2 \left\{ \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} |c_{jk}| (\ln |j|)^\top (\ln |k|)^\top \right\} < \infty.
\end{align*}
\]

**Proof of Corollary 2.2.** Let \( \bar{Q}(m, n) \) consist of all \( (j, k) \) with \( |j| > m \) or \( |k| > n \). By (1.10) and Lemma 3.1, we get

\[
\begin{align*}
\int \int_{\mathbb{T}^2} \left| \frac{s_{mn}(x, y) - f(x, y)}{xy} \right| \, dx \, dy \\
\leq \sum_{(j,k)\in\bar{Q}(m,n)} |c_{jk}| \left\{ \int_{\mathbb{T}} \left| \frac{e^{ijx} - 1}{x} \right| \, dx \right\} \left\{ \int_{\mathbb{T}} \left| \frac{e^{iky} - 1}{y} \right| \, dy \right\} \\
\leq (2\pi + 4)^2 \left\{ \sum_{(j,k)\in\bar{Q}(m,n)} |c_{jk}| (\ln |j|)^\top (\ln |k|)^\top \right\} \\
\to 0 \quad \text{as} \quad \min(m, n) \to \infty.
\end{align*}
\]
Proof of Theorem 2.3. Condition (2.3) ensures the continuity of \( f \) on \( T^2 \). By (2.3) and Lemma 3.1, we obtain
\[
\iint_{T^2} \left| \frac{f(x,y) - f(x,0) - f(0,y) + f(0,0)}{x} \right| \, dx \, dy \leq \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} |c_{jk}| \left\{ \int_{T} \left| \frac{e^{ijx} - 1}{x} \right| \, dx \right\} \left\{ \int_{T} \left| e^{iky} - 1 \right| \, dy \right\} \\
\leq (8\pi^2 + 16\pi) \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} |c_{jk}| |\ln |j||^\top < \infty.
\]
This shows (2.4) and (2.6). (2.5) and (2.7) will be proved similarly. \( \square \)

Proof of Corollary 2.4. Let \( \tilde{Q}(m,n) \) consist of all \((j,k)\) with \(|j| > m\) or \(|k| > n\). By (2.3) and Lemma 3.1, we get
\[
\iint_{T^2} \left| \frac{f(x,y) - f(x,0) - f(0,y) + f(0,0)}{x} \right| \, dx \, dy \leq 2\pi \sum_{(j,k) \in \tilde{Q}(m,n)} |c_{jk}| \left\{ \int_{T} \left| \frac{e^{ijx} - 1}{x} \right| \, dx \right\} \\
\leq (4\pi^2 + 8\pi) \sum_{(j,k) \in \tilde{Q}(m,n)} |c_{jk}| |\ln |j||^\top \\
\longrightarrow 0 \quad \text{as} \quad \min(m,n) \to \infty.
\]

Proof of Theorem 2.5. It suffices to show \((1.11) \Rightarrow (1.10)\). By (1.2) and the Weierstrass M-test theorem, we find that
\[
\int_{\delta}^{\pi} \int_{\epsilon}^{\pi} \frac{f(x,y) - f(x,0) - f(0,y) + f(0,0)}{xy} \, dx \, dy = \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} c_{jk} \left\{ \int_{\epsilon}^{\pi} \cos \frac{y}{x} \, dx \right\} \left\{ \int_{\delta}^{\pi} \cos \frac{1}{y} \, dy \right\} \\
= \{\Sigma_1(\epsilon, \delta) - \Sigma_2(\epsilon, \delta)\} + i\{\Sigma_3(\epsilon, \delta) + \Sigma_4(\epsilon, \delta)\},
\]
where
\[
\Sigma_1(\epsilon, \delta) = \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} c_{jk} \left\{ \int_{\epsilon}^{\pi} \cos \frac{y}{x} \, dx \right\} \left\{ \int_{\delta}^{\pi} \cos \frac{1}{y} \, dy \right\},
\]
\[
\Sigma_2(\epsilon, \delta) = \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} c_{jk} \left\{ \int_{\epsilon}^{\pi} \sin \frac{y}{x} \, dx \right\} \left\{ \int_{\delta}^{\pi} \sin \frac{1}{y} \, dy \right\},
\]
\[
\Sigma_3(\epsilon, \delta) = \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} c_{jk} \left\{ \int_{\epsilon}^{\pi} \cos \frac{y}{x} \, dx \right\} \left\{ \int_{\delta}^{\pi} \sin \frac{1}{y} \, dy \right\},
\]
\[
\Sigma_4(\epsilon, \delta) = \sum_{j=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} c_{jk} \left\{ \int_{\epsilon}^{\pi} \sin \frac{y}{x} \, dx \right\} \left\{ \int_{\delta}^{\pi} \cos \frac{1}{y} \, dy \right\}.
\]
We have assumed (1.11). Therefore, \(\lim_{\epsilon, \delta \downarrow 0} \{\Sigma_1(\epsilon, \delta) - \Sigma_2(\epsilon, \delta)\}\) exists. Set
\[
g_{jk}(\epsilon, \delta) = \left\{ \int_{\epsilon}^{\pi} \cos \frac{x}{y} \, dx \right\} \left\{ \int_{\delta}^{\pi} \sin \frac{1}{y} \, dy \right\}.
\]
Then, for all \( j, k \), we have
\[
\lim_{\epsilon, \delta \downarrow 0} g_{jk}(\epsilon, \delta) = \left\{ \int_0^\pi \frac{\sin jx}{x} \, dx \right\} \left\{ \int_0^\pi \frac{\sin ky}{y} \, dy \right\}.
\]

Since the integral \( \int_0^\pi (\sin nt)/t \, dt \) is uniformly bounded in \( n \) and \( 0 < \xi \leq \pi \), \( \{g_{jk}(\epsilon, \delta)\}_{j,k=-\infty}^\infty \) is uniformly bounded on \( (0, \pi] \times (0, \pi] \). By (1.2) and the Weierstrass M-test theorem, we find that \( \lim_{\epsilon, \delta \downarrow 0} \Sigma_{2} (\epsilon, \delta) \) exists. Thus, \( \lim_{\epsilon, \delta \downarrow 0} \Sigma_{1} (\epsilon, \delta) \) exists. Set
\[
P = \{(j, k) : |j| > N_0 \text{ and } |k| > N_0\} \quad \text{and} \quad \tilde{P} = \{(j, k) : |j| \leq N_0 \text{ or } |k| \leq N_0\}.
\]

Then
\[
\Sigma_{1} (\epsilon, \delta) = \sum_{(j, k) \in P} c_{jk} h_{jk}(\epsilon, \delta) + \sum_{(j, k) \in \tilde{P}} c_{jk} h_{jk}(\epsilon, \delta) = \Sigma_{11} (\epsilon, \delta) + \Sigma_{12} (\epsilon, \delta),
\]
say, where
\[
h_{jk}(\epsilon, \delta) = \left\{ \int_\epsilon^\pi \frac{\cos jx - 1}{x} \, dx \right\} \left\{ \int_\delta^\pi \frac{\cos ky - 1}{y} \, dy \right\}.
\]

For \( |j| \leq N_0 \) and \(-\infty < k < \infty\), we have
\[
|h_{jk}(\epsilon, \delta)| \leq (\pi + 2)^2 (\ln N_0)^T (\ln |k|)^T \quad (0 < \epsilon, \delta \leq \pi),
\]
\[
\lim_{\epsilon, \delta \downarrow 0} h_{jk}(\epsilon, \delta) = \left\{ \int_0^\pi \frac{\cos jx - 1}{x} \, dx \right\} \left\{ \int_0^\pi \frac{\cos ky - 1}{y} \, dy \right\}.
\]

Applying (2.12) and the Weierstrass M-test theorem, we conclude that
\[
\lim_{\epsilon, \delta \downarrow 0} \sum_{|j| \leq N_0} \left\{ \sum_{k=-\infty}^{\infty} c_{jk} h_{jk}(\epsilon, \delta) \right\} \quad \exists.
\]

Similarly, (2.11) implies that
\[
\lim_{\epsilon, \delta \downarrow 0} \sum_{|k| \leq N_0} \left\{ \sum_{|j| > N_0} c_{jk} h_{jk}(\epsilon, \delta) \right\} \quad \exists.
\]

Therefore, \( \lim_{\epsilon, \delta \downarrow 0} \Sigma_{12} (\epsilon, \delta) \) exists and so \( \alpha = \lim_{\epsilon, \delta \downarrow 0} \Sigma_{11} (\epsilon, \delta) \) exists. For \((j, k) \in P\), we have \( c_{jk} \geq 0 \). Hence, Lemma 3.1 leads us to
\[
\infty > \alpha = \sum_{(j, k) \in P} c_{jk} \left\{ \int_0^\pi \frac{1 - \cos jx}{x} \, dx \right\} \left\{ \int_0^\pi \frac{1 - \cos ky}{y} \, dy \right\}
\geq \sum_{(j, k) \in P} |c_{jk}| (\ln |j|)^T (\ln |k|)^T,
\]
and consequently, the desired result follows from (2.11) and (2.12). \( \Box \)
Proof of Theorem 2.7. It can be done by modifying the proof of Theorem 2.5. The essential changes are to replace \((\cos ky - 1)/y\) and \(\sin ky/y\) by \(\cos ky - 1\) and \(\sin ky\), respectively, for each place where they occur. The other changes are

\[
\int_\delta^\pi \int_\epsilon^\pi f(x, y) - f(x, 0) - f(0, y) + f(0, 0) \frac{dx dy}{x} = \left\{ \Sigma_1(\epsilon, \delta) - \Sigma_2(\epsilon, \delta) \right\} + i \left\{ \Sigma_3(\epsilon, \delta) + \Sigma_4(\epsilon, \delta) \right\},
\]

\[
|h_jk(\epsilon, \delta)| \leq \left( 2\pi^2 + 4\pi \right) (\ln N_0) \quad (|j| \leq N_0; -\infty < k < \infty),
\]

\[
|h_jk(\epsilon, \delta)| \leq \left( 2\pi^2 + 4\pi \right) (\ln |j|) \quad (-\infty < j < \infty; |k| \leq N_0),
\]

\[
\alpha > \sum_{(j,k) \in P} c_{jk} \left\{ \int_0^\pi \frac{1 - \cos jx}{x} dx \right\} \left\{ \int_0^\pi (1 - \cos ky) dy \right\}
\]

\[
= \pi \left\{ \sum_{(j,k) \in P} |c_{jk}| (\ln |j|) \right\}. \]

The condition (1.2) implies

\[
\sum_{|j| \leq N_0} \sum_{k=-\infty}^\infty |c_{jk}| (\ln |j|) \leq (\ln N_0) \left( \sum_{|j| \leq N_0} \sum_{k=-\infty}^\infty |c_{jk}| \right) < \infty.
\]

Putting these together with (2.11) yields the desired result. \(\square\)
