UNIFORM ANTI-MAXIMUM PRINCIPLE
FOR POLYHARMONIC BOUNDARY VALUE PROBLEMS

PHILIPPE CLÉMENT AND GUIDO SWEERS

(Communicated by David S. Tartakoff)

Abstract. A uniform anti-maximum principle is obtained for iterated polyharmonic Dirichlet problems. The main tool, combined with regularity results for weak solutions, is an estimate for positive functions in negative Sobolev norms.

1. Introduction and statement of main results

Let us recall the situation for the second order boundary value problem

\begin{equation}
\begin{cases}
-\Delta u = \lambda u + f & \text{in } \Omega, \\
u = 0 & \text{on } \partial \Omega,
\end{cases}
\end{equation}

where \( \Omega \) is a bounded smooth domain in \( \mathbb{R}^n \). It is well known that for \( \lambda < \lambda_1 \), with \( \lambda_1 \) the first eigenvalue, a sign preserving property holds: \( f \geq 0 \) implies that \( u \geq 0 \). In [4] it has been shown that when \( \lambda - \lambda_1 > 0 \) and small, a sign reversing phenomenon occurs. The more precise statement for (1.1) of this so-called anti-maximum principle is as follows:

For \( f \in L^p(\Omega) \) with \( 0 \neq f \geq 0 \) and \( p > n \) there exists \( \lambda_f > \lambda_1 \) such that for \( \lambda \in (\lambda_1, \lambda_f) \) the solution \( u \) of (1.1) satisfies \( u < 0 \) in \( \Omega \).

In [11] it has been proven that the restriction on \( p \), that is \( p > n \), is genuine. Indeed, for \( \Omega \) smooth there is \( f \in L^n(\Omega) \), with \( f > 0 \), such that the solution \( u \) of (1.1) changes sign for all \( \lambda > \lambda_1 \).

A much stronger result would have been that the sign reversing result holds for \( \lambda \in (\lambda_1, \lambda_1 + \delta) \) with \( \delta > 0 \) independent of \( f \). Such a result could be called a uniform anti-maximum principle and in fact exists for another boundary condition. Indeed for the one-dimensional Neumann problem, \( -u'' = \lambda u + f \) in \( \Omega \) with \( u' = 0 \) on \( \partial \Omega \); such a uniform anti-maximum principle was obtained in [4].

In order to get a better understanding when the anti-maximum principle holds uniformly, we consider some elliptic systems of higher order: iterated polyharmonic Dirichlet problems. Let \( m \) and \( k \) be fixed positive integers. Defining

\begin{equation}
D(A) = H^{2m,2}(\Omega) \cap H^{m,2}_0(\Omega), \\
A = (\Delta)^m : D(A) \subset L^2(\Omega) \to L^2(\Omega),
\end{equation}

Key words and phrases. Anti-maximum principle, higher order elliptic, polyharmonic.
we will study for \( f \in L^2(\Omega) \) sign properties for \( \lambda \) near \( \lambda_1 \) of
\[
A^ku = \lambda u + f, \tag{1.3}
\]
where \( \lambda_1 \) is the first eigenvalue of \( A^k \). Equation \((1.3)\) corresponds to the boundary value problem \((-\Delta)^m u = \lambda u + f \) in \( \Omega \), and \((\frac{\partial}{\partial n})^i (-\Delta)^m u = 0 \) on \( \partial\Omega \) for \( i = 0, \ldots, m-1 \) and \( j = 0, \ldots, k-1 \). Here \( n \) denotes the outward normal.

A necessary condition for sign-reversing and sign-preserving property for \((1.3)\) to hold with \( \lambda \) near \( \lambda_1 \), is that the first eigenvalue is simple and that the corresponding eigenfunction has a fixed sign. On general domains polyharmonic operators with Dirichlet boundary conditions do not have a first eigenfunction with a fixed sign. Boggio (3) however proved that for \( \Omega = B \) a ball, the Green function for \( Au = f \) is positive and hence, by results of Jentszch (8) or Krein-Rutman (see 9), the first eigenvalue is algebraically simple and has a strictly positive eigenfunction (see 7). Although the eigenfunction remains positive under small perturbations of the domain (7) we will restrict ourselves to \( \Omega = B \) when \( m > 1 \). Note that eigenfunctions of \( A \) and of \( A^m \), \( m > 1 \), coincide.

**Theorem 1.** Let \( A \) be as in \((1.2)\) and suppose that either
(i) \( m = 1 \) and \( \Omega \) is a bounded domain in \( \mathbb{R}^n \) with \( \partial\Omega \in C^\infty \), or
(ii) \( m > 1 \) and \( \Omega = \{ x \in \mathbb{R}^n; |x| < R \} \) for some \( R > 0 \).

Let \( \lambda_1 \) be the smallest eigenvalue of \( A^k \). If \( n < 2m(k-1) \), then there exists \( \delta > 0 \) such that for all \( \lambda \in (\lambda_1, \lambda_1 + \delta) \) and \( f \in L^2(\Omega) \) with \( 0 \neq f \geq 0 \) the solution \( u \) of \((1.3)\), which belongs to \( C^m(\Omega) \), satisfies
\[
\begin{align*}
\frac{\partial}{\partial n} u (x) &= 0 & & \text{for all } x \in \partial\Omega, \\
(\frac{\partial}{\partial n})^m u (x) &= 0 & & \text{for all } x \in \partial\Omega \text{ and } i \in \{0, 1, \ldots, k-1\}, \\
(\frac{\partial}{\partial n}) u (x) &= 0 & & \text{for all } x \in \partial\Omega.
\end{align*}
\]
(1.4)

The conditions of Theorem 1 guarantee that all eigenvalues are real and positive. Moreover, for \( \lambda \in [0, \lambda_1) \) the system in \((1.3)\) is sign preserving. See 7.

The inequality \( n < 2m(k-1) \) is sharp. A proof of this fact will appear elsewhere.

The result in Theorem 1 coincides with that of Theorem 3 in 5. In 6 more general, not necessarily self-adjoint, boundary value problems were considered using Sobolev spaces \( H^{m,p}(\Omega) \) with \( p \neq 2 \). The non-Hilbert approach forces the proofs to be rather involved. An advantage of using \( L^p \)-type spaces is that one finds as an intermediate result a non-uniform anti-maximum principle. For the system in \((1.3)\) it reads as:

**Proposition 2.** Let \( A \) and \( \Omega \subset \mathbb{R}^n \) be as in Theorem 1. If \( n < 2pm(k-\frac{1}{2}) \), then for \( f \in L^p(\Omega) \) with \( 0 \neq f \geq 0 \) there exists a \( \lambda_f > \lambda_1 \) such that for all \( \lambda \in (\lambda_1, \lambda_f) \) the solution \( u \) of \((1.3)\) which belongs to \( C^m(\Omega) \) satisfies \((1.4)\).

## 2. Solutions to \( Au = f \)

First we will recall and derive some properties of solutions to \( Au = f \), that is, for the system
\[
\begin{align*}
(-\Delta)^m u &= f & & \text{in } \Omega, \\
\frac{\partial}{\partial n} u &= \cdots = (\frac{\partial}{\partial n})^{m-1} u &= 0 & & \text{on } \partial\Omega.
\end{align*}
\]
(2.1)
The spaces $H^{k,2}(\Omega)$ and $H^{k,2}_0(\Omega)$ for $k \in \mathbb{Z}$ that we use are defined in [10]. We recall that
\begin{equation}
H^{-s,2}(\Omega) = \left( H^{s,2}_0(\Omega) \right)', \quad s \in \mathbb{R}.
\end{equation}

For short notation we set $H^{s,2} = H^{s,2}(\Omega)$, etc.

2.1. **Strong solutions.** It follows from Theorem 8.4 of [10, page 196] that the operator $A$ is self-adjoint in $L^2$. Indeed conditions (i), (ii) and (iii) of [10, page 148] are satisfied, the operator $A$ is formally self-adjoint and the boundary operators $C_j$ can be chosen equal to $B_j = (\frac{\partial^k}{\partial x_j^k})$ in Theorem 8.4.

Next we show that $N(A) = \{0\}$. If $u \in D(A)$ satisfies $Au = 0$, then $\langle \langle u, u \rangle \rangle_m = \int_\Omega uAu \, dx = 0$, where the bilinear form $\langle \langle \cdot, \cdot \rangle \rangle_m$ is defined by
\begin{equation}
\langle \langle u, v \rangle \rangle_m = \begin{cases} 
\int_\Omega \Delta \Delta u \Delta \Delta v \, dx & \text{for } m \text{ even}, \\
\int_\Omega \nabla \left( \Delta \frac{\partial u}{\partial x_i} \right) \cdot \nabla \left( \Delta \frac{\partial v}{\partial x_i} \right) \, dx & \text{for } m \text{ odd}.
\end{cases}
\end{equation}

By a one-dimensional version of an inequality of Poincaré it follows for $v \in H^{1,2}_0(\Omega)$ with $\Omega$ bounded, that
\begin{equation}
\int_\Omega v^2 \, dx \leq c_\Omega \int_\Omega \left( \frac{\partial u}{\partial x_i} \right)^2 \, dx \quad \text{for each } i \in \{1, \ldots, n\}.
\end{equation}

Hence there exists $c_{\Omega, m} > 0$ such that
\begin{equation}
\int_\Omega u^2 \, dx \leq c_{\Omega, m} \langle \langle u, u \rangle \rangle_m \quad \text{for all } u \in H^{m,2}_0.
\end{equation}

Therefore $Au = 0$ implies $u = 0$. By applying Theorem 5.4 of [10, page 165] we obtain:

**Lemma 1.** Let $s \geq 0$. For each $f \in H^{s,2}$ there exists a unique solution $u \in H^{m,2}_0 \cap H^{2m+s+2,2}$ of (2.1). Moreover, there exists $c_{\Omega, m, s} > 0$ such that
\begin{equation}
\|u\|_{H^{2m+s+2,2}} \leq c_{\Omega, m, s} \|f\|_{H^{s,2}} \quad \text{for all } f \in H^{s,2}.
\end{equation}

2.2. **Weak solutions.** By duality we may extend the estimate in (4.4) for $s < 0$. Note that [10, Theorem 8.3, page 195] extends the estimate in (2.6) to $s \in [-m, 0)$ with $s + \frac{1}{2} \notin \mathbb{Z}$. For $s \in [-2m, -m)$ the same estimate is no longer true due to the fact that $H^{s,2} = (H^{-s,2}_0)' \text{ has to be replaced with } (H^{m,2}_0 \cap H^{-s,2})'$. For sake of short notation we will use for $\kappa \in \mathbb{N}$
\begin{equation}
\|f\|_{m, -\kappa} = \|f\|_{H^{m, -\kappa}_0(\Omega)}
\end{equation}

where $\langle \varphi, f \rangle$ denotes the value of the functional $f$ at $\varphi$. For $f, g \in L^2$ we will also use the notation $\langle f, g \rangle = \int_\Omega f \, g \, dx$.

Notice that for $m, \kappa > 0$ the norm $\|\cdot\|_{m, -\kappa, 0}$ (resp. $\|\cdot\|_{m, -\kappa}$) is strictly weaker than the norm $\|\cdot\|_{m, -\kappa}$ (resp. $\|\cdot\|_{0, -\kappa}$).

According to Lemma 1 the operator $A_0 : H^{m,2}_0 \cap H^{2m,2} \rightarrow L^2$ defined by $A_0u = Au$ is an isomorphism. Hence $A_{-1} : L^2 \rightarrow (H^{m,2}_0 \cap H^{2m,2})'$ defined by $A_{-1} = A_0'$ is an isomorphism, that is, for all $v \in L^2$ there is unique $f \in (H^{m,2}_0 \cap H^{2m,2})'$ with $A_{-1}v = f$ in the sense that $\int_\Omega v A\varphi \, dx = \langle \varphi, f \rangle$ for all $\varphi \in H^{m,2}_0 \cap H^{2m,2}$. From the
self-adjointness of $A$ it follows that $A_{-1}$ is an extension of $A_0$. We get the following scheme:

$$\tag{2.8} H_0^{m,2} \cap H^{2m,2} \xrightarrow{A_0} L^2 \simeq (L^2)' \xrightarrow{A_{-1}} \left( H_0^{m,2} \cap H^{2m,2} \right)'.$$

Defining for $\kappa \in \mathbb{N}^+$ the spaces

$$\tag{2.9} \begin{align*}
B_{\kappa} &= \left\{ u \in H^{2\kappa,2}; A^j u \in H_0^{m,2} \text{ for } 0 \leq j \leq \kappa \right\}, \\
B_{-\kappa} &= \left( B_{\kappa} \right)' 
\end{align*}$$

and $B_0 = L^2 \simeq (L^2)'$, we obtain the following scale of Hilbert spaces with restrictions and extensions of $A_0$:

$$\tag{2.10} \ldots \xrightarrow{A_{\kappa}} B_{\kappa} \xrightarrow{A_{\kappa-1}} \ldots \xrightarrow{A_1} B_1 \xrightarrow{A_0} B_0 \xrightarrow{A_{-1}} B_{-1} \xrightarrow{A_{-2}} \ldots \xrightarrow{A_{-\kappa}} B_{-\kappa} \xrightarrow{A_{-\kappa-1}} \ldots$$

See [2] Chapter V]. The operators $A_\kappa : B_{\kappa+1} \to B_{\kappa}$ for $\kappa \in \mathbb{Z}$ are isomorphisms. Finally, we introduce the (complex) interpolation spaces $B_{\kappa+\frac{1}{2}}$ defined by

$$\tag{2.11} B_{\kappa+\frac{1}{2}} = [B_{\kappa}, B_{\kappa+1}]_{\frac{1}{2}}.$$

**Lemma 2.** Let $\kappa \in \mathbb{Z}$.

(i) If $\kappa \geq 0$, then $B_{\kappa+\frac{1}{2}} = \left\{ u \in H^{2\kappa+m+2}; A^j u \in H_0^{m,2} \text{ for } 0 \leq j \leq \kappa \right\}$.

(ii) If $\kappa < 0$, then $B_{\kappa+\frac{1}{2}} = \left( B_{-\kappa-\frac{1}{2}} \right)'$.

**Proof.** It is known (see [13] Thm 4.3.3, p.321]) that for $\kappa > 0$ the space $[B_{\kappa}, B_{\kappa+1}]_{1/2}$ is the subspace of $H^{2\kappa+m+2} = \left[H^{2\kappa+(k+1),2}, H^{2m,2}\right]_{1/2}$ submitted to exactly all boundary conditions of $B_{\kappa+1}$ that are of order less than $2m\kappa + m - \frac{1}{2}$. The second result follows from $[X', Y']_0 = [X, Y']_0$ (see [10] Thm 6.2, p.29).

### 3. Positivity and Simplicity of the First Eigenfunction

We will need the first eigenvalue to be simple, with the corresponding eigenfunction positive and having an appropriate behavior at the boundary.

Let $d$ denote the distance to $\partial \Omega$:

$$\tag{3.1} d(x, \partial \Omega) = \inf \left\{ |x - y|; y \in \partial \Omega \right\}.$$

**Lemma 3.** Let $\Omega$ be as in Theorem [7]. Then the first eigenvalue $\mu_{m,1}$ of $A$ is strictly positive and simple. Moreover, the corresponding eigenfunction $\varphi_{m,1}$, chosen positive, satisfies for some $c_m, C_m > 0$

$$\tag{3.2} c_m d(x, \partial \Omega)^m \leq \varphi_{m,1} (x) \leq C_m d(x, \partial \Omega)^m \text{ for all } x \in \Omega.$$

**Proof.** If $m = 1$ and $\Omega$ is a bounded domain in $\mathbb{R}^n$ with smooth boundary, the eigenfunction for the first eigenvalue is positive. The estimate in (3.2) follows from Hopf’s boundary point lemma and $\varphi_{1,1} \in C^1(\bar{\Omega}) \cap C^0(\Omega)$.

Now suppose that $m > 1$. Then $\Omega = \{ x \in \mathbb{R}^n; |x| < R \}$ and the explicit formula of the Green function by Boggio [33] (48), page 126] guarantees that the solution $u$ of $(-\Delta)^m u = f \in C(\bar{\Omega})$ with $0 \neq f \geq 0$ with the Dirichlet boundary conditions $(\frac{\partial}{\partial n})^j u = 0$ on $\partial \Omega$, $j = 0, \ldots, m - 1$, satisfies for some $c_f > 0$

$$\tag{3.3} u(x) \geq c_f d(x, \partial \Omega)^m \text{ for all } x \in \Omega.$$
Since the Green function is positive Jentsch’ Theorem \( [8] \), or Krein-Rutman, implies that the first eigenvalue \( \lambda_{m,1} \) is algebraically simple and that the corresponding eigenfunction \( \varphi_{m,1} \) is positive. Using (3.3) and the fact that \( \varphi_{m,1} \in C^m(\Omega) \cap C^{m-1}_0(\Omega) \) there are \( c_m, C_m > 0 \) such that

\[
(3.4) \quad c_m d(x, \partial \Omega)^m \leq \varphi_{m,1}(x) \leq C_m d(x, \partial \Omega)^m \quad \text{for all } x \in \Omega,
\]

which completes the proof. \( \square \)

4. Solving by eigenfunctions

Recall that the unbounded operator \( A : D(A) \subset L^2 \to L^2 \) is positive self-adjoint (see \( \text{2.5} \)). Since the imbedding of \( H^{2m,2} \) in \( L^2 \) is compact we find that \( A^{-1} : L^2 \to L^2 \) is compact and positive symmetric. Hence \( L^2 \) has a complete orthonormal system consisting of eigenfunctions of \( A \). Let us denote these eigenfunctions by \( \{ \varphi_{m,i} \}_{i=1}^\infty \) and the corresponding eigenvalues by \( \{ \mu_{m,i} \}_{i=1}^\infty \), that is, for \( i, j \in \mathbb{N}^+ \)

\[
(4.1) \quad \begin{cases}
(-\Delta)^m \varphi_{m,i} = \mu_{m,i} \varphi_{m,i} & \text{in } \Omega, \\
\left( \frac{\partial}{\partial n} \right)^\kappa \varphi_{m,i} = 0 & \text{on } \partial \Omega \text{ for } \kappa = 0, 1, \ldots, m, \\
\langle \varphi_{m,i}, \varphi_{m,j} \rangle = \delta_{ij}.
\end{cases}
\]

Using (2.6) repeatedly one finds that \( \varphi_{m,i} \in H^{k,2} \) for all \( k \in \mathbb{N} \) and hence \( \varphi_{m,i} \in C^\infty(\Omega) \). An equivalent norm on the space \( B_\kappa \) defined in (\text{2.9} 2.11) for \( \kappa \in \frac{1}{2} \mathbb{Z} \) is given by

\[
(4.2) \quad \| u \|_{B_\kappa} = \left( \sum_{i=1}^\infty \mu_{m,i}^{2\kappa} \langle \varphi_{m,i}, u \rangle^2 \right)^{\frac{1}{2}}.
\]

We may use these eigenfunctions to solve (1.3). Note that \( \lambda_1 = \mu_{m,1}^k \).

**Lemma 4.** There exist \( C_{k,m,\Omega} > 0 \) and \( \delta > 0 \) such that the following holds. Let \( \lambda \in \mathbb{R} \) with \( |\lambda - \mu_{m,1}^k| < \delta \). For all \( f \in B_{-\frac{1}{2}k} \) with \( \langle \varphi_{m,1}, f \rangle = 0 \) there exists a unique weak solution \( u_\lambda \in B_{-\frac{1}{2}k} \) to

\[
\begin{cases}
(A^k - \lambda) u = f, \\
\langle \varphi_{m,1}, u \rangle = 0,
\end{cases}
\]

and moreover

\[
(4.3) \quad \| u_\lambda \|_{B_{-\frac{1}{2}k}} \leq C_{k,m,\Omega} \| f \|_{B_{-\frac{1}{2}k}}.
\]

**Proof.** The lemma is an immediate consequence of \( \langle \varphi_{m,1}, f \rangle = 0 \), the solution formula

\[
(4.4) \quad u_\lambda = \sum_{i=2}^\infty \frac{1}{\mu_{m,i}^k - \lambda} \langle \varphi_{m,i}, f \rangle \varphi_{m,i}
\]

and choosing \( \delta \in (0, \mu_{m,2}^k - \mu_{m,1}^k) \). \( \square \)
5. A WEIGHTED C-SPACE

Let us define \( C_{d^m}(\Omega) = \{ u \in C(\Omega) ; \| u \|_{d^m} < \infty \} \) where
\[
\| u \|_{d^m} = \sup \left\{ \frac{|u(x)|}{d(x, \partial \Omega)^m} ; x \in \Omega \right\}.
\]
A similar space \( C_e(\Omega) \) has been used by Amann in [1], where \( e \) is the solution to \(-\Delta e = 1 \) in \( \Omega \) and \( e = 0 \) on \( \partial \Omega \). For \( \partial \Omega \in C^1,\gamma \) the spaces \( C_e(\Omega) \) and \( C_{d^m}(\Omega) \) coincide. Note that
\[
C_0^{m-1}(\Omega) \cap C^m(\Omega) \hookrightarrow C_{d^m}(\Omega) \hookrightarrow C_0(\Omega).
\]

5.1. An imbedding. The next lemma is a consequence of the imbedding
\[
H_0^m \cap H^{m+\kappa} \hookrightarrow C_0^{m-1}(\Omega) \cap C^m(\Omega) \quad \text{for } n < 2\kappa.
\]

Lemma 5. Let \( \Omega \subset \mathbb{R}^n \) be a bounded domain with \( \partial \Omega \in C^\infty \) and suppose that \( n < 2\kappa \). Then there exists \( c_{\Omega, m, \kappa} > 0 \) such that for all \( u \in H_0^m \cap H^{m+\kappa} \)
\[
\| u \|_{d^m} \leq c_{\Omega, m, \kappa} \| u \|_{H^{m+\kappa}}.
\]

Proof. Since \( 2\kappa > n \) the Rellich-Kondrachov Theorem shows that there exists a \( c_{\Omega, \kappa} > 0 \) such that \( \| u \|_{C^m(\Omega)} \leq c_{\Omega, \kappa} \| u \|_{H^{m+\kappa}} \). If \( v \in C^1(\Omega) \cap H_0^m \), then \( v = 0 \) on \( \partial \Omega \) and hence (an inequality of Poincaré)
\[
|v(x)| \leq \| v \|_{C^1(\Omega)} d(x, \partial \Omega) \quad \text{for all } x \in \Omega.
\]
A repeated use of the last inequality shows that \( u \in C^m(\Omega) \cap H_0^m \) satisfies
\[
|u(x)| \leq \frac{1}{m!} \| u \|_{C^m(\Omega)} d(x, \partial \Omega)^m \quad \text{for all } x \in \Omega,
\]
and hence (5.4) follows with \( c_{\Omega, m, \kappa} = c_{\Omega, \kappa} / m! \).

By the previous lemma and the definition of the norm in (2.4) for the dual space we find:

Corollary 3. Let \( \Omega \subset \mathbb{R}^n \) be a bounded domain with \( \partial \Omega \in C^\infty \) and suppose that \( n < 2\kappa \). Then there exists \( c_{\Omega, m, \kappa} > 0 \) such that for all \( f \in L^2 \)
\[
\| f \|_{-m, -\kappa} \leq c_{\Omega, m, \kappa} \sup \{ \| \langle \varphi, f \rangle \| : \varphi \in C_{d^m}(\Omega) \quad \text{with } \| \varphi \|_{d^m} \leq 1 \}.
\]

6. AN ESTIMATE FOR POSITIVE FUNCTIONS IN A NEGATIVE SOBOLEV SPACE

Proposition 4. Let \( \varphi_{m, 1} \) be the first eigenfunction of (1.1) satisfying (3.3) and normalized by \( \langle \varphi_{m, 1}, \varphi_{m, 1} \rangle = 1 \). Let \( 2\kappa > n \). Then there exists \( c > 0 \) such that for all \( f \in L^2 \) with \( f \geq 0 \) the following estimate holds:
\[
\sqrt{\mu \| f \|_{-m, -\kappa}} \leq c \langle \varphi_{m, 1}, f \rangle.
\]

Proof. Let us define \( f_\varepsilon = f - \langle \varphi_{m, 1}, f \rangle \varphi_{m, 1} \). In view of (5.7) it is sufficient to prove that there exists a constant \( C \) such that
\[
\langle \varphi, f \rangle \leq C \langle \varphi_{m, 1}, f \rangle
\]
for all \( \varphi \in C_{d^m}(\Omega) \) with \( \| \varphi \|_{d^m} \leq 1 \).

Let \( \varphi \) be such a function. Hence by (4.2) we have
\[
|\varphi(x)| \leq c_{m, \varphi_{m, 1}}^{-1}(x) \quad \text{for all } x \in \Omega.
\]
Since \( \langle \varphi_{m,1}, f_c \rangle = 0 \) it follows that
\begin{equation}
(6.4) \quad \langle \varphi, f_c \rangle = \langle c_{m}^{-1}\varphi_{m,1} - \varphi, -f_c \rangle
\end{equation}
where \( (6.3) \) shows that \( c_{m}^{-1}\varphi_{m,1} - \varphi \geq 0 \). From \( f \geq 0 \) we obtain \( -f_c \leq \langle \varphi_{m,1}, f \rangle \varphi_{m,1} \) and hence
\begin{equation}
(6.5) \quad \langle c_{m}^{-1}\varphi_{m,1} - \varphi, -f_c \rangle \leq \langle c_{m}^{-1}\varphi_{m,1} - \varphi, \langle \varphi_{m,1}, f \rangle \varphi_{m,1} \rangle.
\end{equation}
Since \( \langle \varphi_{m,1}, f \rangle \varphi_{m,1} \geq 0 \) and since \( (6.5) \) also implies that \( c_{m}^{-1}\varphi_{m,1} + \varphi \geq 0 \), we find
\begin{equation}
(6.6) \quad \langle c_{m}^{-1}\varphi_{m,1} - \varphi, \langle \varphi_{m,1}, f \rangle \varphi_{m,1} \rangle \leq \langle 2c_{m}^{-1}\varphi_{m,1}, \langle \varphi_{m,1}, f \rangle \varphi_{m,1} \rangle.
\end{equation}
Combining \( (6.4), (6.5), (6.6) \) and \( \langle \varphi_{m,1}, \varphi_{m,1} \rangle = 1 \) we obtain \( (6.2) \) with \( C = 2c_{m}^{-1} \).

Proposition [1] can be reformulated as an embedding of \( L^1(\Omega, \varphi_{m,1}dx) \) into \( (H^{m,2}_0 \cap H^{m+\kappa,2})' \).

Corollary 5. Let \( \varphi_{m,1} \) and \( \kappa \) be as in Proposition [4]. Then there exists \( c_1 > 0 \) such that
\begin{equation}
(6.7) \quad \|f\|_{-m,-\kappa} \leq c_1 \int_{\Omega} |f| \varphi_{m,1} dx \quad \text{for all } f \in L^1(\Omega, \varphi_{m,1}dx).
\end{equation}

Proof. Since \( L^2 \) is dense in \( L^1(\Omega, \varphi_{m,1}dx) \) it is sufficient to show \( (6.7) \) for \( f \in L^2 \). Set \( f^+ = \frac{1}{2}(|f| + f) \). By Proposition [4] we find
\begin{align*}
\|f^+\|_{-m,-\kappa} &\leq \|f^+ - \langle \varphi_{m,1}, f^+ \rangle \varphi_{m,1}\|_{-m,-\kappa} + \|\langle \varphi_{m,1}, f^+ \rangle \varphi_{m,1}\|_{-m,-\kappa} \\
&\leq (c + c_{\varphi_{m,1}}) \int_{\Omega} f^+ \varphi_{m,1} dx.
\end{align*}

With the estimate for \( f^- = \frac{1}{2}(|f| - f) \) we find \( (6.7) \) for \( c_1 = c + c_{\varphi_{m,1}} \). 

7. PROOF OF THE MAIN RESULT

In order to prove Theorem [1] we consider \( S_{\lambda} : B_{\frac{L}{2k}} \to B_{-\frac{L}{2k}} \) defined by \( S_{\lambda} = A^k - \lambda \). For \( f \in B_{-\frac{L}{2k}} \) and \( \lambda \neq \mu_{m,i} \) we have the solution \( u \) satisfies
\begin{equation}
(7.1) \quad u = \frac{1}{\mu_{m,1} - \lambda} \langle \varphi_{m,1}, f \rangle \varphi_{m,1} + u_{e,\lambda}
\end{equation}
where \( u_{e,\lambda} = (S_{\lambda})^{-1} f_e \) with \( f_e = f - \langle \varphi_{m,1}, f \rangle \varphi_{m,1} \). By Lemma [4] we have
\begin{equation}
(7.2) \quad \|u_{e,\lambda}\|_{B_{\frac{L}{2k}}} \leq C_1 \|f_e\|_{B_{-\frac{L}{2k}}}
\end{equation}
and since \( B_{-\frac{L}{2k}} \supset (H^m_0 \cap H^{km})' \) it follows that
\begin{equation}
(7.3) \quad \|f_e\|_{B_{-\frac{L}{2k}}} \leq C_2 \|f_e\|_{-m,-(k-1)m}.
\end{equation}
By Proposition [4] we find if \( 2(k-1) \) \( m > n \) that
\begin{equation}
(7.4) \quad \|f_e\|_{-m,-(k-1)m} \leq C_3 \langle \varphi_{m,1}, f \rangle.
\end{equation}
Since \( u_{e,\lambda} \in B_{\frac{L}{2k}} \subset H^m_0 \cap H^{km} \) we have
\begin{equation}
(7.5) \quad \|u_{e,\lambda}\|_{H^m_0 \cap H^{km}} \leq C_4 \|u_{e,\lambda}\|_{B_{\frac{L}{2k}}}.
\end{equation}
and assuming $2(k - 1)m > n$ it follows by Lemma 5 with $\kappa = (k - 1)m$ that
\begin{equation}
\|u_{\epsilon, \lambda}\|_{d_{\epsilon}} \leq C_5 \|u_{\epsilon, \lambda}\|_{H^{k_m} \cap H^{k_m}}.
\end{equation}
Hence for all $\lambda$ with $|\lambda - \mu_{m,1}^k| < \delta$ and $\delta$ as in Lemma 4 we find by using (7.6), (7.7), (7.8), and (7.9):
\begin{equation}
|u_{\epsilon, \lambda}(x)| \leq C_6 \langle \varphi_{m,1}, f \rangle d(x, \partial \Omega)^m.
\end{equation}
Finally, using the estimate in Lemma 3 for $\varphi_{m,1}$ we find that if $0 < \lambda - \mu_{m,1}^k < \delta_1$ with $\delta_1 = \min \left\{ \delta, \frac{\mu_{m,1}^k}{c_m} \right\}$, then
\begin{equation}
|\lambda - \mu_{m,1}^k|\varphi_{m,1}(x) < 0.
\end{equation}
Since $-\varphi_{m,1}$ satisfies the estimates in (1.4) the solution $u$ satisfies these same estimates.

Observe that for $-\delta_1 < \lambda - \mu_{m,1}^k < 0$ a similar estimate from below recovers the maximum principle.
