SELF-DUAL CODES OVER $\mathbb{Z}_4$
AND HALF-INTEGRAL WEIGHT MODULAR FORMS

YOUNGJU CHOIE AND PATRICK SOLÉ

(Communicated by Dennis A. Hejhal)

Abstract. In this paper, we find a connection between the weight enumerator of self-dual $\mathbb{Z}_4$ codes and half-integral weight modular forms. We generalize in that way results of Broué-Enguehard, Hirzebruch, Ozeki, Rains-Sloane, Runge.

1. Introduction

Since the times of Felix Klein and his work on the icosahedron, [11], there has existed a kind of dictionary between invariant polynomials of finite groups and the modular forms of number theory. More recently, since the seminal talk of Gleason at the ICM 1970 in Nice [10], invariant theory has been found to have important applications in combinatorics in connection with the study of weight enumerators of self-dual codes over finite fields [12].

In 1972, these two trends fused when Broué and Enguehard [2] established a ring isomorphism between, on the one hand, the space of invariant polynomials for the finite group that leaves weight enumerators of Type II binary codes invariant and, on the other, the ring of modular forms of weight a multiple of four.

In the 90’s, this topic met with renewed interest for two main reasons:

- new alphabets (finite rings) appeared;
- new weight enumerators were discovered.

As an example of the latter, we can cite polynomial analogues for modular forms of a number of different types: Jacobi [1] (a generalized split weight enumerator); Hilbert [8] (a Lee weight enumerator); Siegel [7][15] (a higher joint weight enumerator); and Jacobi forms of higher genus [1] (a higher complete and symmetrized weight enumerator). On the “flip” side (i.e., ring-theoretic front), one can mention the fact that the complete weight enumerator of Type II codes over the ring $\mathbb{Z}_{2^m}$ determines a Jacobi form for the full Jacobi group [5].

The Broué-Enguehard map itself was extended by Ozeki [1][13] and independently by Runge [15] to the ring of modular forms of even weight. A similar connection between the ring of modular forms of integral weight and self-dual binary codes was established by Rains and Sloane [14, p.282].

In this note, we study a Broué and Enguehard type map from the algebra of invariants, where the symmetric weight enumerators of self-dual codes over $\mathbb{Z}_4$ live,
to the ring of half integral weight modular forms on the congruence group \( \Gamma_0(4) \) and the theta group \( \Gamma_6 \). We thus generalize to a wider class of modular forms the last two mentioned results. Note that the quaternary alphabet used here is instrumental in what seems to be the simplest known construction of the Leech lattice \([3]\).

2. The weight enumerator of a code over \( \mathbb{Z}_4 \)

A linear code \( C \) of length \( n \) over \( \mathbb{Z}_4 \) is an additive subgroup of \( \mathbb{Z}_4^n \) and an element of \( C \) is called a codeword. We denote by \( |C| \) the number of codewords in \( C \). The inner product of \( x \) and \( y \) in \( \mathbb{Z}_4^n \) is given by
\[
x \cdot y = x_1 y_1 + \cdots + x_n y_n \pmod{4}.
\]
The dual code \( C^\perp \) of \( C \) is defined as \( C^\perp = \{ y \in \mathbb{Z}_4^n \mid x \cdot y = 0 \text{ for all } x \in C \} \). If \( C = C^\perp \), then \( C \) is called self-dual.

The complete weight enumerator \( cwe \) of \( C \) over \( \mathbb{Z}_4 \) is defined by
\[
cwe(W, X, Y, Z) = \sum_{u \in C} W^{n_0(u)} X^{n_1(u)} Y^{n_2(u)} Z^{n_3(u)},
\]
where \( n_k(u) \) denotes the number of components of \( u \) which are equal to \( k \) modulo 4. The symmetrized weight enumerator \( swe \) of \( C \) over \( \mathbb{Z}_4 \) is given by
\[
swe(W, X, Y) = \frac{1}{|C|} \cdot cwe(W + X + Y, W - X - Y, W - X + Y + iZ).
\]
The MacWilliams identity of \( cwe \) of the code \( C \) over \( \mathbb{Z}_4 \) is known as

**Theorem 2.1.** 1.
\[
cwe(C^\perp) = \frac{1}{|C|} cwe(W + X + Y + Z, W + iX - Y - iZ, W - X + Y - Z, W - iX - Y + iZ).
\]
2. \( swe(C^\perp) = \frac{1}{|C|} swe(W + 2X + Y, W - Y, W - 2X + Y) \).

**Proof.** See \([3]\) or \([4]\), for instance.

3. Jacobi forms and theta-series

Let \( \Gamma \) be an arbitrary subgroup of finite index in \( SL_2(\mathbb{Z}) \) and let \( \chi \) be a character of \( \Gamma \). A function \( \phi : \mathcal{H} \times \mathbb{C} \to \mathbb{C} \) is said to be a Jacobi form of a weight \( \omega \) and an index \( m \) for \( \Gamma \) with respect to \( \chi \) (see \([3]\)) if

1. \( \phi\left( \frac{a \tau + b}{c \tau + d}, \frac{z}{c \tau + d} \right) = (c \tau + d)^{\omega} \chi(M) \exp(2\pi im \tau) \phi(\tau, z), \forall M = \left( \begin{array}{cc} a & b \\ c & d \end{array} \right) \in \Gamma; \)
2. \( \phi(\tau, z + \lambda \tau + \mu) = e^{2\pi i m (\lambda^2 \tau + 2\lambda z)} \phi(\tau, z), \forall (\lambda, \mu) \in \mathbb{Z}^2; \)
3. \( \phi(\tau, z) \) has a Fourier expansion of the following type:
\[
\phi(\tau, z) = \sum_{n, r \in \mathbb{Z}, r^2 \leq 4mn} c(n, r) e^{2\pi i r \tau} e^{2\pi i rz}.
\]

We also recall the following theta-series \( \theta_{2, \mu}(\tau, z) \) which was introduced to find the correspondence between Jacobi forms and modular forms of half integral weight (see \([3]\)):
\[
\theta_{2, \mu}(\tau, z) := \sum_{r \in \mathbb{Z}, r \equiv \mu (\text{mod } 4)} e^{2\pi i r^2 \tau} e^{2\pi i rz}.
\]
Remark 3.1. The theta-series $\theta_{2,\mu}(\tau, z) = \sum_{\nu \in \mathbb{Z}, \nu \equiv \mu \pmod{4}} e^{\pi i \nu^2 \tau + \pi i \nu z}$ satisfies the following relations:

(i) $\theta_{2,\mu}(\tau, z)$ is well-defined and holomorphic on $\mathbb{H} \times \mathbb{C}$;

(ii) $\theta_{2,\mu}(\tau + 1, z) = e^{\frac{\pi i}{\tau}} \theta_{2,\mu}(\tau, z), \mu \in \{0, 1, 2, 3\}$;

(iii) $\theta_{2,\mu} \left( \frac{1 - z}{\tau} \right) = \sqrt{\frac{\tau}{4i}} e^{\frac{\pi i z^2}{\tau}} \sum_{\nu \equiv \mu \pmod{4}} e^{-\pi i \nu^2 \tau} \theta_{2,\nu}(\tau, z)$;

(iv) $\theta_{2,\mu}(\tau, z + \lambda \tau + \nu) = e^{-\pi i (\lambda^2 \tau + 2\lambda \nu)} \theta_{2,\mu}(\tau, z), \forall (\lambda, \nu) \in \mathbb{Z}^2$.

The more general type of theta-series $\theta_{m,\mu}(\tau, z)$ has been used to study the connection between Jacobi forms and codes over the ring $\mathbb{Z}_{2m}$ (see [3]). In particular, when $m = 2$, we get the following relations among the theta-series:

$$
\begin{align*}
\theta_{2,0}(\tau, 0) &= \frac{\theta_3(\tau) + \theta_4(\tau)}{2}, \theta_{2,1}(\tau, 0) = \theta_{2,3}(\tau, 0) = \frac{\theta_2(\tau)}{2}, \\
\theta_{2,2}(\tau, 0) &= \frac{\theta_3(\tau) - \theta_4(\tau)}{2},
\end{align*}
$$

where

$$
\theta_2(\tau) = \sum_{n \in \mathbb{Z}} q^{(n^2 + 1)/2}, \theta_3(\tau) = \sum_{n \in \mathbb{Z}} q^n,
\theta_4(\tau) = \theta_3(\tau + 1) = \sum_{n \in \mathbb{Z}} (-q)^n, \text{ with } q = e^{\pi i \tau}.
$$

The following relations are well-known identities among theta series.

**Proposition 3.2.**

$$
\begin{align*}
\theta_2(\tau + 1) &= \sqrt{i} \theta_2(\tau), \theta_3(\tau + 1) = \theta_4(\tau), \theta_4(\tau + 1) = \theta_3(\tau), \\
\theta_2(\frac{-1}{\tau}) &= (\frac{\tau}{i})^{\frac{1}{2}} \theta_4(\tau), \theta_3(\frac{-1}{\tau}) = (\frac{\tau}{i})^{\frac{1}{2}} \theta_3(\tau), \theta_4(\frac{-1}{\tau}) = (\frac{\tau}{i})^{\frac{1}{2}} \theta_2(\tau), \\
\theta_3(\tau) \theta_4(\tau) &= \theta_4(2\tau)^2, \theta_2(\tau^4) + \theta_4(\tau^4) = \theta_3(\tau)^4, \theta_3(\tau)^2 - \theta_4(\tau)^2 = 2 \theta_2(2\tau)^2.
\end{align*}
$$

**Proof.** See, for instance, [6].

4. JACOBI FORMS AND CODES OVER $\mathbb{Z}_4$

We adapt two theorems derived in [5] in a different context to the class of self-dual $\mathbb{Z}_4$-codes.

**Theorem 4.1.** Let $C \subset \mathbb{Z}_4^n$ be a linear code with complete weight enumerator $\text{cwe}_C(W, X, Y, Z)$. Let

$$
\theta_{\Lambda(C),2}(\tau, z) = \sum_{x \in \Lambda(C)} e^{\pi i (x \cdot x) \tau} e^{2\pi i (P \cdot x) z}, P = \frac{1}{2}(1, 1, \ldots, 1) \in \Lambda(C),
$$

where $\Lambda(C)$ is the lattice associated to the code $C$. Then

$$
\theta_{\Lambda(C),2}(\tau, z) = \text{cwe}_C(\theta_{2,0}(\tau, z), \theta_{2,1}(\tau, z), \theta_{2,2}(\tau, z), \theta_{2,3}(\tau, z)).
$$

**Proof.** This is an elaboration of Theorem 4 given in [5]. Let $u = (u_1, \ldots, u_n)$ be any given codeword of $C$ and $n(u) = N_k$. For $\bar{u} = (\bar{u}_1, \ldots, \bar{u}_n) \in \mathbb{Z}^n$, if $\varphi(\bar{u}) = u$ and $0 \leq \bar{u}_k < 4$ for all $k$, then it is easy that the set $\varphi^{-1}(u)$ equals the set $\varphi^{-1}(0) + \bar{u}$,
and the number of $k$ ($0 \leq k < 4$) of $\hat{u}_1, \cdots, \hat{u}_n$ is exactly $N_k$. Thus, for given $u \in C$,

$$
\sum_{Y \in \varphi^{-1}(u)} e^{2\pi i \left( \frac{1}{2} (Y \cdot Y) \tau + (Y \cdot z) \right)}
= \sum_{Y \in \varphi^{-1}(0)} e^{2\pi i \left( \frac{1}{2} (Y \cdot Y + \hat{u} \cdot Y) \tau + (Y \cdot \hat{u}) \right)}
= \sum_{Y_1 \in 4Z + \hat{u}_1} \cdots \sum_{Y_n \in 4Z + \hat{u}_n} e^{2\pi i \left( \frac{1}{2} (Y_1^2 + \cdots + Y_n^2) \tau + (Y_1 + \cdots + Y_n) z \right)}
= (\sum_{Y_1 \in 4Z + \hat{u}_1} e^{2\pi i \left( \frac{1}{2} Y_1^2 + Y_1 z \right)})
\cdots (\sum_{Y_n \in 4Z + \hat{u}_n} e^{2\pi i \left( \frac{1}{2} Y_n^2 + Y_n z \right)})
= (\sum_{Y_1 \in 4Z + \hat{u}_1} q^{\frac{Y_1^2}{2\tau}} \xi(Y_1)) \cdots (\sum_{Y_n \in 4Z + \hat{u}_n} q^{\frac{Y_n^2}{2\tau}} \xi(Y_n))
= \theta_{2,0}(\tau, z)^{N_0} \theta_{2,1}(\tau, z)^{N_1} \theta_{2,2}(\tau, z)^{N_2} \theta_{2,3}(\tau, z)^{N_3}
$$

implies that

$$\theta_{\Lambda(C),2}(\tau, z) = cu_0e_{\tau}(\theta_{2,0}(\tau, z), \theta_{2,1}(\tau, z), \theta_{2,2}(\tau, z), \theta_{2,3}(\tau, z)).$$

**Theorem 4.2.** If $C \subset \mathbb{Z}_4^n$ is a self-dual linear code, then the theta-series $\theta_{\Lambda(C),2}(\tau, z)$ satisfies the following functional equations:

1. $\theta_{\Lambda(C),2}(\tau + 2, z) = \theta_{\Lambda(C),2}(\tau, z)$;
2. $\theta_{\Lambda(C),2}(\tau, \frac{z}{\tau}) = e^{2\pi i \frac{2}{(\tau, \tau)}(z, z)} \theta_{\Lambda(C),2}(\tau, z)$;
3. $\theta_{\Lambda(C),2}(\tau, z + \lambda \tau + \nu) = e^{2\pi i \frac{2}{(\tau, \tau)}(\lambda \tau, \nu)} \theta_{\Lambda(C),2}(\tau, z)$.

So, $\theta_{\Lambda(C),2}(\tau, z)$ is a Jacobi form of weight $\frac{2}{\tau}$ and index $\frac{\nu}{\tau}$ over $\Gamma_0$ with respect to $\chi_0$. Here, $\chi_0$ is the character on $\Gamma_0$ defined as $\chi(0(\begin{smallmatrix} 0 & 1 \\ 1 & 0 \end{smallmatrix})) = 1, \chi(0(\begin{smallmatrix} 1 & 1 \\ 1 & 0 \end{smallmatrix})) = i$.

**Proof.** We adapt Theorem 3.2 and Proposition 4.2 in [5] (Proposition 4.2 in [5] is valid only for Type II code $C$ over $\mathbb{Z}_{2m}$) to the situation at hand. The first functional equation (1) is immediate from the definition of the theta-series $\theta_{\Lambda(C),2}(\tau, z)$. The second functional equation follows from Poisson-summation formula,

$$\theta_{\Lambda(C),2}(\tau, z) = \frac{1}{\text{vol}(\mathbb{R}^n/\Lambda(C))} \left( \frac{\tau}{\tau} \right)^{\frac{1}{2}} e^{2\pi i \frac{2}{\tau} \theta_{\Lambda(C),2}(\tau, z)},$$

and self-duality of $\Lambda(C)$. The last equation (3) follows from

$$e^{2\pi i \frac{2}{\tau} \theta_{\Lambda(C),2}(\tau, z + \lambda \tau + \mu)} = \sum_{x \in \Lambda(C)} e^{((x + \lambda \tau + \mu) \cdot (x + \lambda \tau))} e^{2\pi i \frac{2}{\tau} ((x + \lambda \tau) \cdot \nu)} z
= \theta_{\Lambda(C),2}(\tau, z),$$

since $\lambda \tau$ is again in $\Lambda(C)$. Now, to claim that $\theta_{\Lambda(C),2}(\tau, z)$ is a Jacobi form, one needs to check only the condition at infinity. The condition at infinity can be checked from the fact that, for each $x = (x_1, \ldots, x_n) \in \Lambda(C)$, $\frac{(x_1 + x_2 + \cdots + x_n)^2}{n} \leq x_1^2 + x_2^2 + \cdots + x_n^2$. The result follows.

Regarding invariants of finite groups, we use the following piece of notation. If $G$ is a matrix group acting on a polynomial ring $R$, we denote by $R^G$ (resp. $R^G_n$) the ring of invariants; that is,

$$R^G = \{ f \in R \forall g \in G \mid g.f = f \}$$

(resp. the set of elements of $R^G_n$ of degree $n$).
Corollary 4.3. Let $C$ be a self-dual code over $\mathbb{Z}_4^n$.

1. Let $G_2$ be the group generated by

$$M_4 = \frac{1}{2} \begin{pmatrix} 1 & 1 & 1 & 1 \\ 1 & i & -1 & -i \\ 1 & -1 & 1 & -1 \\ 1 & -i & -1 & i \end{pmatrix} \quad \text{and} \quad N_4 = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & i & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & i \end{pmatrix}.$$

Then $\text{cweC}(W, X, Y, Z) \in \mathbb{C}[W, X, Y, Z]|_{G_4}$.

2. Let $G_3$ be the matrix group generated by the matrices

$$N_3 = \begin{pmatrix} 1 & 0 & 0 \\ 0 & i & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad \text{and} \quad M_3 = \frac{1}{2} \begin{pmatrix} 1 & 2 & 1 \\ 1 & 0 & -1 \\ 1 & -2 & 1 \end{pmatrix}.$$

Then $\text{cweC}(W, X, Y) \in \mathbb{C}[W, X, Y]|_{G_3}$.

Proof. The results follow directly from the functional equation of $\theta_{2,1}(\tau, z)$ in Remark 5.1 and the functional equation $\theta_{\lambda(C), 2}(\tau, z)$ with Theorem 2.1. So, we omit the detailed proof.

Theorem 4.4. If $h \in \mathbb{C}[W, X, Y, Z]|_{G_{n+1}}$ is a degree $n$ homogeneous polynomial invariant under $G_4$, then $h(\theta_{2,0}(\tau, z), \theta_{2,1}(\tau, z), \theta_{2,2}(\tau, z), \theta_{2,3}(\tau, z))$ is a Jacobi form of weight $\frac{n}{2}$ and index $\frac{1}{2}$ on $\Gamma_0$ with respect to $\chi_0$. Here, $\chi_0$ is the character defined in the statement of Theorem 4.2.

Proof. Let $H(\tau, z) = h(\theta_{2,0}(\tau, z), \theta_{2,1}(\tau, z), \theta_{2,2}(\tau, z), \theta_{2,3}(\tau, z))$. Then one can check the two functional equations of $H(\tau, z)$ by using the relations among $\theta_{2,1}(\tau, z)$ given in Remark 5.1. The condition of the Fourier expansion is valid since $h$ is a polynomial in theta-series.

Theorem 4.5. Let $g \in \mathbb{C}[W, X, Y, Z]|_{G_4}$ be a degree $n$ homogeneous polynomial. Then $g(\theta_{2,0}(2\tau, z), \theta_{2,1}(2\tau, z), \theta_{2,2}(2\tau, z), \theta_{2,3}(2\tau, z))$ is a Jacobi form of weight $\frac{n}{2}$ and index $\frac{1}{2}$ on $\Gamma_0(4)$ with respect to the trivial character.

Proof. Let $G(\tau, z) = g(\theta_{2,0}(2\tau, z), \theta_{2,1}(2\tau, z), \theta_{2,2}(2\tau, z), \theta_{2,3}(2\tau, z))$. Since $\Gamma_0(4)$ is generated by two elements $(\frac{1}{2} \ 0)$ and $(\frac{1}{4} \ 1)$, one only needs to check two functional equations of $G(\tau, z)$ under the action of $\Gamma_0(4)$. This can be done using the relations among $\theta_{2,1}(2\tau, z)$ given in Remark 3.1. The condition on the Fourier expansion holds since $g$ is a polynomial in theta-series.

5. Half integral weight modular forms and codes over $\mathbb{Z}_4$

Let $\Gamma$ be an arbitrary subgroup of finite index in $SL_2(\mathbb{Z})$ and let $\chi$ be a character of $\Gamma$. A complex valued function $f : \mathcal{H} \rightarrow \mathbb{C}$ is called a modular form of weight $\omega$ for $\Gamma$ with respect to $\chi$ if

1. $f(\tau)$ is holomorphic for $Im(\tau) > 0$;
2. $f\left(\frac{a \tau + b}{c \tau + d}\right) = (c \tau + d)\omega\sqrt{c} f(\tau)$, $\forall M = \left( \begin{array}{cc} a & b \\ c & d \end{array} \right) \in \Gamma$;
3. $f(\tau)$ is “holomorphic” at every cusp of $\Gamma$.

First, let us recall the following classical result studied by Hecke (see [6], p. 187).
**Theorem 5.1.** 1. Let $\Gamma_\theta$ be the group generated by $(\frac{1}{2}, 0)$ and $(0, -1)$, and the character $\chi_0$ be given by $\chi_0((\frac{1}{2}, 0)) = 1, \chi_0((0, -1)) = i$. Let $\mathcal{M}(\Gamma_\theta, \chi_0)$ be the space of modular forms of weight $\frac{2}{2}$ on $\Gamma_\theta$ with respect to $\chi_0$. Then

$$\mathcal{M}(\Gamma_\theta, \chi_0) = \bigoplus_{n=0}^{\infty} \mathcal{M}(\Gamma_\theta, \chi_0) = \mathbb{C}[\theta_3(\tau), \Delta_8(\tau)].$$

Here,

$$\theta_3(\tau) = \sum_{n \in \mathbb{Z}} q^n,$$

$$\Delta_8(\tau) = \frac{1}{16} \theta_2(\tau)^4 \theta_4(\tau)^4 = q \prod_{m=1}^{\infty} \{(1 - q^{2m-1})(1 - q^{4m})\}^{-8}, \text{ with } q = e^{\pi i \tau}.$$

2. Let $\mathcal{M}(\Gamma_0(4), id)$ be the space of modular forms of weight $\frac{2}{2}$ on $\Gamma_0(4)$ with trivial character $\chi = id$. Then

$$\mathcal{M}(\Gamma_0(4), id) = \bigoplus_{n=0}^{\infty} \mathcal{M}(\Gamma_0(4), id) = \mathbb{C}[\theta_3(2\tau), g(\tau)].$$

Here, $g(\tau)$, defined as

$$g(\tau) := \theta_2^2(2\tau) - 2\theta_3(2\tau)\theta_4(2\tau),$$

is a modular form of weight $2$ in $\Gamma_0(4)$.

**Remark 5.2.** 1. In general, it is known that the ring $\mathcal{M}(\Gamma_0(4), id)$ is isomorphic to $\mathbb{C}[\theta_3(\tau), F_2(\tau)]$, where $F_2$ is any modular form of weight $2$, which is linearly independent from $\theta_3(\tau)^4$, on $\Gamma_0(4)$.

2. One can check, from Proposition 3.2, that $g(\tau) := \theta_2^2(\tau) - 2\theta_3(2\tau)\theta_4(2\tau)$ is a modular form of weight $2$ on $\Gamma_0(4)$.

**Remark 5.3.** If $\phi(\tau, z)$ is a Jacobi form of weight $\omega$ and index $m$ on $\Gamma$ with respect to $\chi$, then $\phi(\tau, 0)$ is a modular form of weight $\omega$ on $\Gamma$ with respect to $\chi$.

**Theorem 5.4.** The map $\phi : \mathbb{C}[W, X, Y]^{G_3} \rightarrow \mathbb{C}[\theta_3, \Delta_8]$ defined by

$$\phi(f(W, X, Y)) = f(\frac{\theta_3(\tau) + \theta_4(\tau)}{2}, \frac{\theta_2(\tau)}{2}, \frac{\theta_3(\tau) - \theta_4(\tau)}{2})$$

is an algebra epimorphism.

**Proof.** From Theorem 4.4 one notes that for any homogeneous polynomial $f$ of degree $n$ in $\mathbb{C}[W, X, Y]^{G_3}$, $f(\theta_{2,0}(\tau, z), \theta_{2,1}(\tau, z), \theta_{2,2}(\tau, z))$ is a Jacobi form of weight $\frac{2}{2}$ and index $\frac{3}{2}$. This means that, by specializing to $z = 0$, the quantity $f(\theta_{2,0}(\tau, 0), \theta_{2,1}(\tau, 0), \theta_{2,2}(\tau, 0))$ is a modular form of weight $\frac{2}{2}$ on $\Gamma_\theta$ with respect to $\chi_0$. The structure Theorem 5.1 with Proposition 3.2 implies that $\phi(f(W, X, Y)) \in \mathbb{C}[\theta_3, \Delta_8]$. Also, $\phi$ is onto because

$$\phi(W + Y) = \theta_3(\tau), \quad \phi(X^4(W - Y)^4) = \Delta_8(\tau).$$

**Theorem 5.5.** The map

$$\tilde{\phi} : \mathbb{C}[W, X, Y]^{G_3} \rightarrow \mathbb{C}[\theta_3(2\tau), g(\tau)],$$

given by $\tilde{\phi}(f(W, X, Y)) = f(\frac{\theta_3(2\tau) + \theta_4(2\tau)}{2}, \frac{\theta_2(2\tau)}{2}, \frac{\theta_3(2\tau) - \theta_4(2\tau)}{2})$, is an algebra homomorphism. Here $g(\tau)$ is a modular form of weight $2$ defined by (5.1).

**Proof.** Theorem 4.5 implies that $\tilde{\phi}$ is well defined.
