REAL INTERPOLATION OF VECTOR-VALUED SPACES
IN NON-DIAGONAL CASE

IRINA ASEKRITOVA AND NATAN KRUGLJAK

(Communicated by N. Tomczak-Jaegermann)

Abstract. It is shown that the formula
\[(l^{s_0}_{p_0}(A_0), \ldots, l^{s_n}_{p_n}(A_n))_{\vec{\theta}, q} = l^{s_\vec{\theta}, q}_{q}((A_0, \ldots, A_n)_{\vec{\theta}, q}),\]
where \(\vec{\theta} = (\theta_0, \ldots, \theta_n)\) and \(s = \theta_0 s_0 + \ldots + \theta_n s_n\) is correct under the restrictions
\(A_{n-1} = A_n\) and \(s_{n-1} \neq s_n\). It is also true if we suppose that
\(A_n = (A_0, A_1, \ldots, A_{n-1})_{\vec{\lambda}, p}, s_n \neq \lambda_0 s_0 + \lambda_1 s_1 + \ldots + \lambda_{n-1} s_{n-1}\),
and the spaces \(A_0, A_1, \ldots, A_{n-1}\) are functional Banach or quasi-Banach lattices
on the same measure space \((\Omega, \mu)\).

1. Introduction

It is well known that interpolation of vector-valued spaces is a powerful tool for
several different areas, and it is especially important for modern analysis (see, for
example, the survey [GKKT] and the book [BL], Chapter 6). The first vector-valued result for the real method was obtained in 1964 by J.-L. Lions and J. Peetre
(see [LP]) who proved that in the diagonal case, i.e. \(\frac{1}{q} = \frac{1}{p_0} + \frac{1}{p_1}\) for any
couple \((A_0, A_1)\), the following holds:
\[ (L^{s_0}_{p_0}(A_0), L^{s_1}_{p_1}(A_1))_{\theta, q} = L^{s_\theta}_{q}((A_0, A_1)_{\theta, q}). \]

The \(K\)-functional for the couple \((L^{p_0}(A_0), L^{p_1}(A_1))\) was calculated by G. Pisier (see [P]) in connection with some problems in analysis.

Of course, it would be nice to have an analogue of the formula (1.1) in the non-
diagonal case, i.e. when \(q \neq p_0\), but unfortunately such a formula is not true (see M. Cwikel [C]). The only known result in the non-diagonal case is the following
(see [BL]):
\[ (l^{s_0}_{p_0}(A), l^{s_1}_{p_1}(A))_{\theta, q} = l^{s_\theta}_{q}(A), \quad s_0 = (1 - \theta)s_0 + \theta s_1, s_0 \neq s_1, \]
where \(l^{s}_{p}(A)\) denotes the space of all sequences \(a = \{a_k\}_{k \in \mathbb{Z}}, a_k \in A\), such that
\[ \|a\|_{l^{s}_{p}(A)} = \left( \sum_{k \in \mathbb{Z}} (2^k \|a_k\|_A)^p \right)^{\frac{1}{p}} \]
with the usual change for \( p = \infty \). In the scalar case, i.e. when \( A = \mathbb{R} \), the formula (1.2) was obtained by J. Peetre (see [Pe]). The vector-valued case is not far beyond because spaces are constructed on the base of the same space \( A \).

In the present paper we will consider an analogue of the formula (1.2) for more than two spaces. One of our results, which gives (1.2) in the case of couples, is the following formula:

\[
(1.4) \quad (l_{p_0}^n(A_0), ..., l_{p_n}^n(A_n))_{\theta,q} = l_q^s((A_0, ..., A_n)_{\bar{\theta},q}), \quad s = \theta_0 s_0 + ... + \theta_n s_n
\]

under the restrictions

\[
(1.5) \quad A_{n-1} = A_n, \quad s_{n-1} \neq s_n.
\]

An interesting feature of (1.4) is the absence of restrictions for the spaces and parameters with indices less than \( n \). The proof of (1.4) is much more complicated than the proof of (1.2) and is based on geometrical decreasing of some terms in the expression for the norm of the interpolation space \((l_{p_0}^n(A_0), ..., l_{p_n}^n(A_n))_{\bar{\theta},q}\).

The restriction (1.5) can be considered as the limiting case of the restriction:

\[
(1.6) \quad A_n = (A_0, A_1, ..., A_{n-1})_{\bar{\lambda},p}, \quad s_n \neq \lambda_0 s_0 + \lambda_1 s_1 + ... + \lambda_{n-1} s_{n-1}.
\]

In the present paper we will prove a general result from which we derive the formula (1.4) with the restrictions (1.5) under the additional condition that the spaces \( A_0, A_1, ..., A_{n-1} \) are functional Banach or quasi-Banach lattices on the same measure space \((\Omega, \mu)\). The last condition appeared because our proof is based on the iteration theorem from [AK]. It can be weakened, but we do not know if the result is correct without any conditions on the spaces \( A_0, A_1, ..., A_{n-1} \).

The starting point for this investigation is the problem of interpolation of several smooth function spaces. It is known that the interpolation of couples of smooth spaces is not stable in non-diagonal interpolation; for example, if we interpolate two Besov spaces, then we go out of the scale of Besov spaces. In [AKNMP] it was shown that contrary to the case of couples the non-diagonal interpolation of three smooth function spaces has a stability property. This result was based on the wavelet description of Besov spaces and the description of the interpolation space \((L_{p_0}(\omega_0), ..., L_{p_n}(\omega_n))_{\bar{\theta},q}\), which was done in [AKNMP] for \( n = 2 \) under rather heavy restrictions on weights and parameters of integration. In our next paper [AKN] we will use our new results to provide the description of the spaces \((L_{p_0}(\omega_0), ..., L_{p_n}(\omega_n))_{\bar{\theta},q}\) in general without any conditions on \( n \), weights and parameters of integration.

2. Definitions and some results from real interpolation of several spaces

Let \( A_0, A_1, ..., A_n \) be \( n + 1 \) Banach or quasi-Banach spaces. We will say that they form a compatible collection or simply a collection \( \bar{A} = (A_0, A_1, ..., A_n) \) if they are linearly and continuously embedded in some (common for all) topological linear space with a Hausdorff topology. Then we can, analogously to the case of couples, define the \( K \)-functional (see [S]) by the formula:

\[
(2.1) \quad K(\bar{t}, a; \bar{A}) = \inf(||a_0||_{A_0} + t_1 ||a_1||_{A_1} + ... + t_n ||a_n||_{A_n}), \quad \bar{t} = (t_1, t_2, ..., t_n) \in \mathbb{R}_+^n,
\]

where \( \inf \) is taken over all decompositions \( a = a_0 + a_1 + ... + a_n \).

Let \( \bar{\theta} = (\theta_0, \theta_1, ..., \theta_n) \) be a parameter vector, i.e. \( \theta_i > 0, \theta_0 + \theta_1 + ... + \theta_n = 1 \), and let \( 0 < q \leq \infty \).
Then the interpolation spaces \( \tilde{A}_{\tilde{\theta},q} = (A_0, A_1, ..., A_n)_{\tilde{\theta},q} \) (usually these spaces are called \( K \)-spaces and are denoted by \( A_{\theta,q;K} \), but we will omit the index \( K \) as we will only consider \( K \)-spaces) are defined by the norm (or a quasinorm, for the sake of simplicity we will always say norm)

\[
\|a\|_{\tilde{\theta},q} = \left( \int_{\mathbb{R}^+_2} \left( t_1^{-\theta_1}t_2^{-\theta_2}...t_n^{-\theta_n} K(\tilde{\vartheta}, a; \tilde{A}) \right)^q \frac{dt_1}{t_1} \frac{dt_2}{t_2} ... \frac{dt_n}{t_n} \right)^{\frac{1}{q}}
\]

with the usual change for \( q = \infty \). As the \( K \)-functional is a concave function on \( \mathbb{R}^+_n \), therefore the norm (2.2) can be written in an equivalent form:

\[
\|a\|_{\tilde{\theta},q} \approx \left( \sum_{(i_1,i_2,...,i_n) \in \mathbb{Z}^n} (2^{-\theta_1 i_1} 2^{-\theta_2 i_2} ... 2^{-\theta_n i_n} K(\tilde{\vartheta}, 2^{i_1}, 2^{i_2}, ..., 2^{i_n}; \tilde{A}) )^q \right)^{\frac{1}{q}}.
\]

We will use the so-called “monotonicity” properties of interpolation spaces, which follow easily from the definitions. Namely:

A) if \( q_0 \leq q_1 \), then

\[
(A_0, A_1, ..., A_n)_{\tilde{\theta},q_0} \subset (A_0, A_1, ..., A_n)_{\tilde{\theta},q_1};
\]

B) if we have embeddings \( A_i \subset B_i \) \( (i = 0, ..., n) \), then

\[
(A_0, A_1, ..., A_n)_{\tilde{\theta},q} \subset (B_0, B_1, ..., B_n)_{\tilde{\theta},q}.
\]

We will also use the following Reiteration Theorem\(^1\) which was proved in [AK] in the Banach case (the proof can be extended after some modification to the quasi-Banach case). It is important that this theorem is true even for the extended parameter vectors. The parameter vector \( \tilde{\theta} \) is called an extended parameter vector if some of its coordinates \( \theta_i \) could be equal to zero. In this case in the definition of the \( K \)-functional and norms we omit the spaces \( A_i \), parameters \( t_i \) and integrate on the set of smaller dimension. In a particular case, when \( \tilde{\theta} \) has one, say \( i \), coordinate equal to one, and therefore all other coordinates are equal to zero, by \( (A_0, A_1, ..., A_n)_{\tilde{\theta},q} \) we will mean the space \( A_i \).

**Theorem 1** (Reiteration Theorem). Suppose that all spaces \( A_0, A_1, ..., A_n \) are functional Banach or quasi-Banach lattices on the same measure space \( (\Omega, \mu) \) and the extended parameter vectors \( \tilde{\theta}^k \) \( (k = 1, ..., m) \) span \( \mathbb{R}^{n+1} \). Then the following holds:

\[
(\tilde{A}_{\tilde{\theta}_0,q_0}, \tilde{A}_{\tilde{\theta}_1,q_1}, ..., \tilde{A}_{\tilde{\theta}_m,q_m})_{\tilde{\lambda},q} = \tilde{A}_{\tilde{\theta},q}, \tilde{\lambda} = \lambda_0 \tilde{\theta}_0 + \lambda_1 \tilde{\theta}_1 + ... + \lambda_m \tilde{\theta}_m,
\]

where \( \tilde{\lambda} = (\lambda_0, ..., \lambda_m) \) is a parameter vector and \( q, q_i \in (0, \infty) \), \( i = 0, ..., n \).

3. Main result

Let \( \{A^{(k)}\}_{k \in \mathbb{Z}} \) be a sequence of Banach or quasi-Banach spaces \( A^{(k)} \). In the quasi-Banach case we suppose the following important condition holds: constants in the triangle inequality are uniformly bounded. Let \( l_p(\{A^{(k)}\}) \) denote the

---

\(^1\)The general reiteration theorem for several spaces was proved by G. Sparr (see [S]) with the condition that the equivalence theorem holds, and it was proved by I. Asekritova (see [A]) with the condition of weak \( K \)-divisibility; however, the class of collections of Banach spaces for which these conditions hold has not been described.
vector-valued space of all sequences \( a = \{a^{(k)}\}_{k \in \mathbb{Z}}, a^{(k)} \in A^{(k)} \), with the norm
\[
\|a\|_{l_p,\{\{A^{(k)}\}_{k \in \mathbb{Z}}\}} = \left( \sum_{k \in \mathbb{Z}} \left\| a^{(k)} \right\|_{A^{(k)}}^p \right)^{\frac{1}{p}}
\]
with the usual change for \( p = \infty \).

Let \( \{A_i^{(k)}\}_{k \in \mathbb{Z}} \) be a family of \( n + 1 \) sequences of Banach or quasi-Banach spaces. We suppose that for each \( k \in \mathbb{Z} \) the spaces \( A_0^{(k)}, ..., A_{n-1}^{(k)} \) form a compatible collection and therefore we can define the spaces \( \bar{A}_{\vec{\theta}, q}^{(k)} = (A_0^{(k)}, ..., A_{n}^{(k)})_{\vec{\theta}, q} \).

Our main result reads as follows:

**Theorem 2.** Suppose that
\[
A_n^{(k)} = c^k A_{n-1}^{(k)} \quad \text{for all} \quad k \in \mathbb{Z} \quad \text{and some fixed positive number} \quad c \neq 1.
\]
Then
\[
l_{p_i}(\{A_0^{(k)}\}_{k \in \mathbb{Z}}), ..., l_{p_i}(\{A_n^{(k)}\}_{k \in \mathbb{Z}})_{\vec{\theta}, q} = l_q(\{(A_0^{(k)}, ..., A_{n}^{(k)})_{\vec{\theta}, q}\}_{k \in \mathbb{Z}}),
\]
where \( p_i, q \in (0, \infty), i = 0, 1, ..., n \).

**Remark 1.** Formula (1.1) from the Introduction immediately follows from the theorem with \( c = 2^{s_{n-1}} \) if we take \( A_i^{(k)} = 2^{s_i} A_i \) \((k \in \mathbb{Z}, i = 0, ..., n)\).

**Proof.** As the right-hand side of (3.2) does not depend on \( p_0, ..., p_n \), therefore from the monotonicity property of interpolation spaces (see (2.5)) it follows that it is enough to prove (3.2) in the case when all \( p_i \) are equal. So we will give the proof for \( p_0 = ... = p_n = p \). We will consider only the case \( c = 2 \), since for \( c > 1 \) the proof is the same. For \( c < 1 \) the easiest way to see that the theorem holds is to change the order of spaces \( A_i^{(k)} \), i.e. to consider first the spaces \( B_i^{(k)} = A_i^{(k+1)} \) \((k \in \mathbb{Z}, i = 0, ..., n)\) to apply the theorem to the spaces \( B_i^{(k)} \) with \( c^{-1} > 1 \) and then change the order back.

We will use the shorthand notation
\[
l_p(\{A_0^{(k)}\}_{k \in \mathbb{Z}}), ..., l_p(\{A_n^{(k)}\}_{k \in \mathbb{Z}}) = \overline{l_p(A)},
\]
and also
\[
(A_0^{(k)}, ..., A_{n-1}^{(k)}) = \bar{A}_{n-1}^{(k)}, \quad (A_0^{(k)}, ..., A_{n}^{(k)}) = \bar{A}_{n}^{(k)}.
\]

Let us first prove the embedding
\[
l_p(\{A_0^{(k)}\}_{k \in \mathbb{Z}}), ..., l_p(\{A_n^{(k)}\}_{k \in \mathbb{Z}})_{\vec{\theta}, q} \subset l_q(\{(A_0^{(k)}, ..., A_{n}^{(k)})_{\vec{\theta}, q}\}_{k \in \mathbb{Z}}).
\]
From the definition of the \( K \)-functional we have for any element \( a = \{a^{(k)}\}_{k \in \mathbb{Z}} \) from \( \bar{A}_n^{(k)} \) and any \( k \in \mathbb{Z} \),
\[
K(\vec{t}, a; \overline{l_p(A)}) \geq K(\vec{t}, a^{(k)}; \bar{A}_n^{(k)}) = K(\vec{t}, a^{(k)}; A_0^{(k)}, ..., A_{n-1}^{(k)}, 2^k A_{n}^{(k)}) \approx K(t_1, ..., t_{n-2}, \min(t_{n-1}, 2^k t_n), a^{(k)}; A_0^{(k)}, ..., A_{n}^{(k)}).
\]

---

2 The equality for the sequence of Banach or quasi-Banach spaces \( A_i = B_i \) \((i \in I)\) means that the spaces \( A_i, B_i \) coincide as sets, norms are equivalent for each \( i \) and the constants of equivalence are independent of \( i \).
In (3.6) instead of the equivalence we have an equality when $A_{n-1}^{(k)}$ is a Banach space, 
but in the general quasi-Banach case we only have an equivalence with the constant 
independent of $k$ as we supposed that the constants in the triangle inequality are 
uniformly bounded.

Therefore, if we take $t_m = 2^{im}$, $m = 1, ..., n$, and then choose $k$ such that $t_{n-1} = 
2^k t_n$ (so $k = t_{n-1} - t_n$), we obtain

$$
\|(1 - i)^{\frac{1}{2}} (2^{-1} - i)^{\frac{1}{2}} \cdot \cdot \cdot (2^{-1} - n)^{\frac{1}{2}} K(2^{s_1}, ..., 2^{s_n}; a; l_p(A)) \|_{\ell_2} \geq \gamma (\sum_i \sum_{i \in Z^n} (2^{-1} - i) \cdot \cdot \cdot \cdot (2^{-1} - n) K(2^{s_1}, ..., 2^{s_n}; a; A_0^{(k)} \cdot \cdot \cdot A_n^{(k)}) )^\frac{1}{2}
$$

$$
= \gamma (\sum_i \sum_{i \in Z^n} (2^{-1} - i) \cdot \cdot \cdot \cdot (2^{-1} - n) K(2^{s_1}, ..., 2^{s_n}; A_0^{(k)} \cdot \cdot \cdot A_n^{(k)}) )^\frac{1}{2}.
$$

Here and later $\gamma$ denotes some constants that are different for different formulas.

If we change the variable $i_n$ by the variable $s = t_{n-1} - t_n$, then we can rewrite the 
expression in the right-hand side as

$$
\|(1 - i)^{\frac{1}{2}} (2^{-1} - i)^{\frac{1}{2}} \cdot \cdot \cdot (2^{-1} - n)^{\frac{1}{2}} K(2^{s_1}, ..., 2^{s_n}; a; l_p(A)) \|_{\ell_2} \geq \gamma (\sum_s \sum_{s \in Z^n} (2^{-1} - i) \cdot \cdot \cdot \cdot (2^{-1} - n) K(2^{s_1}, ..., 2^{s_n}; a; A_0^{(s)} \cdot \cdot \cdot A_n^{(s)}) )^\frac{1}{2}
$$

As \((A_n^{(s)})_{s_1, ..., s_n-1, t_n, t_n, q}^\frac{1}{2} = \{A_0^{(s)} \cdot \cdot \cdot A_n^{(s)}\}_{\ell_2}\), then

$$
\|(1 - i)^{\frac{1}{2}} (2^{-1} - i)^{\frac{1}{2}} \cdot \cdot \cdot (2^{-1} - n)^{\frac{1}{2}} K(2^{s_1}, ..., 2^{s_n}; a; l_p(A)) \|_{\ell_2} \geq \gamma (\sum_s \sum_{s \in Z^n} (2^{-1} - i) \cdot \cdot \cdot \cdot (2^{-1} - n) K(2^{s_1}, ..., 2^{s_n}; A_0^{(s)} \cdot \cdot \cdot A_n^{(s)}) )^\frac{1}{2}
$$

Hence from (3.7) and (3.9) it follows that $\|a\|_{(l_p(A))_{\ell_2}} \geq \gamma \|a\|_{l_q \left(\{A_n^{(k)}\}_{\ell_2}\right)}$, and this proves the embedding (3.5).

To prove the inverse embedding

$$
l_q \left(\{A_0^{(k)} \cdot \cdot \cdot A_n^{(k)}\}_{\ell_2}\right) \subset (l_p \left(\{A_0^{(k)}\}_{\ell_2}\right), ..., l_p \left(\{A_n^{(k)}\}_{\ell_2}\right))_{\ell_2}
$$

let us take an element $a = \{a^{(k)}\}_{k \in Z}$ from $l_q \left(\{A_0^{(k)} \cdot \cdot \cdot A_n^{(k)}\}_{\ell_2}\right)$. Then for any 
fixed $2^m = (2^{s_1}, ..., 2^{s_n})$ and $\gamma > 1$ we can find decompositions

$$
a^{(k)} = a_0^{(k)} + ... + a_n^{(k)} (k \in Z)
$$
such that

\[(3.12) \quad \|a_0^{(k)}\|_{A_n^{(k)}} + \ldots + 2^{i_n} \|a_n^{(k)}\|_{A_n^{(k)}} \leq \gamma K(2^n, a^{(k)}; \vec{A}_n^{(k)}).
\]

From the definition of the $K$-functional and (3.12) it follows that

\[(3.13) \quad K(2^n, a; \vec{l}_{p}(\vec{A})) \leq \left\| \left\{ a_0^{(k)} \right\}_{l_p(A)} + \ldots + 2^{i_n} \left\| \left\{ a_n^{(k)} \right\}_{l_p(A)} \right\| \right\|_{l_p(A)} \]
\[\leq \gamma \left( \sum_{k \in \mathbb{Z}} \|K(2^n, a^{(k)}; \vec{A}_n^{(k)}))\|^p \right)^{1/p},
\]

with some constant $\gamma$.

Hence from the definition of the norm of the space $(l_p(\left\{ A_0^{(k)} \right\}), \ldots, l_p(\left\{ A_n^{(k)} \right\}))_{q,q}$ we have

\[(3.14) \quad \|a\|_{l_p(\left\{ A_0^{(k)} \right\}), \ldots, l_p(\left\{ A_n^{(k)} \right\}))_{q,q} = \left( \sum_{i \in \mathbb{Z}^n} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^n, a^{(k)}; \vec{A}_n^{(k)}))^{q} \right)^{1/q}
\]
\[\leq \gamma \left( \sum_{i \in \mathbb{Z}^n} \left( \frac{\sum_{k \in \mathbb{Z}} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^n, a^{(k)}; \vec{A}_n^{(k)}))^{(p)} \right)^{q})^{1/q}
\]
\[= \gamma \left( \sum_{i \in \mathbb{Z}^n} \left( \frac{\sum_{k \in \mathbb{Z}} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^n, a^{(k)}; \vec{A}_n^{(k)}))^{(p) \frac{1}{q}} \right)^{q})^{1/q}
\]

If $\frac{q}{p} \leq 1$, then

\[\left( \sum_{i \in \mathbb{Z}^n} \left( \sum_{k \in \mathbb{Z}} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^n, a^{(k)}; \vec{A}_n^{(k)}))^{(p) \frac{1}{q}} \right)^{q})^{1/q}
\]
\[\leq \left( \sum_{i \in \mathbb{Z}^n} \sum_{k \in \mathbb{Z}} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^n, a^{(k)}; \vec{A}_n^{(k)}))^{q})^{1/q}
\]
\[= \left( \sum_{k \in \mathbb{Z}} \left( \sum_{i \in \mathbb{Z}^n} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^n, a^{(k)}; \vec{A}_n^{(k)}))^{q})^{1/q}
\]
\[= \left( \sum_{k \in \mathbb{Z}} \left( \left\| a^{(k)} \right\|_{l_p(\vec{A}_n^{(k)}))_{q,q}} \right)^{q}) \frac{1}{q} = \left\| a \right\|_{l_p(\vec{A}_n^{(k)}))_{q,q}}
\]

which proves (3.10).

The case when $\frac{q}{p} > 1$ is more complicated. As $A_n^{(k)} = 2^k A_{n-1}^{(k)} \quad (k \in \mathbb{Z}^n)$ so

\[(3.15) \quad K(2^n, a^{(k)}; \vec{A}_n^{(k)}) \approx K(2^{i_1}, \ldots, 2^{i_{n-2}}, \min(2^{i_{n-1}}, 2^{i_{n+k}}), a^{(k)}; \vec{A}_n^{(k)})
\]
(with uniform constants of equivalence). We can estimate the right-hand side of (3.14) as follows:

\[
\left( \sum_{\tau \in \mathbb{Z}_n} \left( \sum_{k \in \mathbb{Z}} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^i, a(k); A_n^{(k)}))^{\frac{p}{q}} \right)^{\frac{q}{2}} \right)^{\frac{1}{q}} \\
\leq \gamma \left( \sum_{\tau \in \mathbb{Z}_n} \left( \sum_{k \in \mathbb{Z}} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^i, a(k); A_n^{(k)}))^{\frac{p}{q}} \right)^{\frac{q}{2}} \right)^{\frac{1}{q}} \\
\leq \gamma \left( \sum_{\tau \in \mathbb{Z}_n} \left( \sum_{k \in \mathbb{Z}} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^i, a(k); A_n^{(k)}))^{\frac{p}{q}} \right)^{\frac{q}{2}} \right)^{\frac{1}{q}} \\
+ \gamma \sum_{i} \left( \sum_{k \in \mathbb{Z}} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^i, a(k); A_n^{(k)}))^{\frac{p}{q}} \right)^{\frac{q}{2}}^{\frac{1}{q}} .
\]

Therefore to prove the theorem it is enough to obtain the estimates

\[
(3.16) \\
S_1 = \left( \sum_{\tau \in \mathbb{Z}_n} \left( \sum_{k \in \mathbb{Z}} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^i, a(k); A_n^{(k)}))^{\frac{p}{q}} \right)^{\frac{q}{2}} \right)^{\frac{1}{q}} \\
\leq \gamma \|a\|_{l_2^q}\left(\{A_n^{(k)}\}_{k \in \mathbb{Z}}\right) ;
\]

\[
(3.17) \\
S_2 = \left( \sum_{\tau \in \mathbb{Z}_n} \left( \sum_{k \in \mathbb{Z}} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^i, a(k); A_n^{(k)}))^{\frac{p}{q}} \right)^{\frac{q}{2}} \right)^{\frac{1}{q}} \\
\leq \gamma \|a\|_{l_2^q}\left(\{A_n^{(k)}\}_{k \in \mathbb{Z}}\right) .
\]

Let us start with (3.16). If we denote \(s = i_{n-1} - i_n - k\), then using the Minkovski inequality (we can use it because \(\frac{q}{p} > 1\)) we will have

\[
(3.18) \\
S_1 = \left( \sum_{\tau \in \mathbb{Z}_n} \left( \sum_{k \in \mathbb{Z}} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^i, a(k); A_n^{(k)}))^{\frac{p}{q}} \right)^{\frac{q}{2}} \right)^{\frac{1}{q}} \\
= \left( \sum_{\tau \in \mathbb{Z}_n} \left( \sum_{k \in \mathbb{Z}} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^i, a(k); A_n^{(k)}))^{\frac{p}{q}} \right)^{\frac{q}{2}} \right)^{\frac{1}{q}} \\
\leq \gamma \left( \sum_{\tau \in \mathbb{Z}_n} \left( \sum_{k \in \mathbb{Z}} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^i, a(k); A_n^{(k)}))^{\frac{p}{q}} \right)^{\frac{q}{2}} \right)^{\frac{1}{q}} \\
= 2^{\theta_n} \gamma \left( \sum_{\tau \in \mathbb{Z}_n} \left( \sum_{k \in \mathbb{Z}} (2^{-i_1 \theta_1} \ldots 2^{-i_n \theta_n} K(2^i, a(k); A_n^{(k)}))^{\frac{p}{q}} \right)^{\frac{q}{2}} \right)^{\frac{1}{q}} \\
\leq 2^{\theta_n} \gamma \left( \sum_{k \in \mathbb{Z}} \|a(k)\|_{l_2^q}^{\frac{q}{2}} \right)^{\frac{1}{q}} = 2^{\theta_n} \gamma \|a\|_{l_2^q}\left(\{A_n^{(k)}\}_{k \in \mathbb{Z}}\right) ,
\]
and we obtain the required estimate of $S_1$ (see (3.16))

\[(3.19) \quad S_1 \leq \gamma \left( \sum_{s \leq 0} (2^{s \theta_n} \|a\|_{l_0(\{A^{(k)}_{s,q}\}_s)})^{q/2} \right)^{\frac{q}{2}} \leq \gamma \|a\|_{l_0(\{A^{(k)}_{s,q}\}_s)}.
\]

For $S_2$ (see (3.17)) the estimation is analogous. Indeed, for the same $s = i_{n-1} - i_n - k$ we have, by using the Minkovski inequality,

\[(3.20) \quad S_2 = \left( \sum_{\gamma \in \mathbb{Z}^{n}} \left( \left\|2^{-i_1 \theta_1} \cdots 2^{-i_n \theta_n} K(2^{i_2} \cdots, 2^{i_{n-1} - k}, 2^{i_{n-1} + k}; A^{(k)}_{n-1}) \right\|_{l_0(\{A^{(k)}_{s,q}\}_s)} \right)^{\frac{q}{2}} \right) \frac{1}{q} \leq \left( \sum_{\gamma \in \mathbb{Z}^{n}} \left( \left\|2^{-i_1 \theta_1} \cdots 2^{-i_n \theta_n} K(2^{i_2} \cdots, 2^{i_{n-1} - s}, A^{(i_{n-1} - i_n - s)}_{n-1}) \right\|_{l_0(\{A^{(k)}_{s,q}\}_s)} \right)^{\frac{q}{2}} \right) \frac{1}{q}.
\]

For each $s$ (by using (3.15)) we have

\[(3.21) \quad S_2 \leq 2^{-s \theta_{n-1}} \gamma \left( \sum_{\gamma \in \mathbb{Z}^{n}} \left( \left\|2^{-i_1 \theta_1} \cdots 2^{-i_n \theta_n} K(2^{i_2} \cdots, 2^{i_{n-1} - s}, A^{(i_{n-1} - i_n - s)}_{n-1}) \right\|_{l_0(\{A^{(k)}_{s,q}\}_s)} \right)^{\frac{q}{2}} \right) \frac{1}{q} \leq \gamma \left( \sum_{\gamma \in \mathbb{Z}^{n}} \left( \left\|2^{-i_1 \theta_1} \cdots 2^{-i_n \theta_n} K(2^{i_2} \cdots, 2^{i_{n-1} - s}, A^{(i_{n-1} - i_n - s)}_{n-1}) \right\|_{l_0(\{A^{(k)}_{s,q}\}_s)} \right)^{\frac{q}{2}} \right) \frac{1}{q}.
\]

So for $S_2$ we have the required estimate:

\[(4.1) \quad S_2 \leq \gamma \left( \sum_{\gamma \in \mathbb{Z}^{n}} \left( \left\|2^{-i_1 \theta_1} \cdots 2^{-i_n \theta_n} K(2^{i_2} \cdots, 2^{i_{n-1} - s}, A^{(i_{n-1} - i_n - s)}_{n-1}) \right\|_{l_0(\{A^{(k)}_{s,q}\}_s)} \right)^{\frac{q}{2}} \right) \frac{1}{q} \leq \gamma \|a\|_{l_0(\{A^{(k)}_{s,q}\}_s)}.
\]

This concludes the proof of the estimates (3.16, 3.17) and the theorem. \qed

4. Vector-valued interpolation with the “intermediate” condition

Theorem 2 was proved under the condition $A^{(k)}_{n-1} = c^k A^{(k)}_{n-1}$ for all $k \in \mathbb{Z}$ and some fixed $c \neq 1$. Here we will consider the “intermediate” condition $A^{(k)}_{n-1} = c^k (A^{(k)}_{0}, ..., A^{(k)}_{n-1})_{\lambda, r}$. We even consider a slightly more general case.

Let us suppose that for some fixed $r_0 \leq r_1$, $c \neq 1$, and some parameter vector $\lambda \in \mathbb{R}^n$ and all $k \in \mathbb{Z}$ we have embeddings with norms independent of $k$:

\[(4.1) \quad c^k (A^{(k)}_{0}, ..., A^{(k)}_{n-1})_{\lambda, r_0} \subseteq A^{(k)}_n \subseteq c^k (A^{(k)}_{0}, ..., A^{(k)}_{n-1})_{\lambda, r_1}.
\]

Now we can formulate the problem:

**Problem 1.** Does the formula

\[(l_{p_0}(\{A^{(k)}_{0}\}_{k \in \mathbb{Z}}), ..., l_{p_n}(\{A^{(k)}_n\}_{k \in \mathbb{Z}}))_{\theta, q} = l_{q}(\{A^{(k)}_0, ..., A^{(k)}_n\}_{\theta, q})_{k \in \mathbb{Z}}
\]

hold under the condition (4.1)?
We will prove the following result.

**Theorem 3.** Suppose that for each \( k \in \mathbb{Z} \) the spaces \( A_{0}^{(k)}, ..., A_{n-1}^{(k)} \) are functional Banach or quasi-Banach lattices on the same measure space \((\Omega_{k}, \mu_{k})\). If the condition \((1.1)\) holds, then

\[
(4.2) \quad (l_{p_0}(\{A_{0}^{(k)}\}_{k \in \mathbb{Z}}), ..., l_{p_n}(\{A_{n}^{(k)}\}_{k \in \mathbb{Z}}))_{\tilde{q}, q} = l_{q}(\{(A_{0}^{(k)}, ..., A_{n}^{(k)})_{\tilde{q}, q}\}_{k \in \mathbb{Z}}).
\]

Proof. From the reiteration theorem (see Theorem 1) and \((2.3-2.4)\) it follows that it is enough to give the proof in the case when

\[
p_0 = ... = p_n = r_0 = r_1 = p.
\]

So we have only to prove

\[
(l_{p}(\{A_{0}^{(k)}\}_{k \in \mathbb{Z}}), ..., l_{p}(\{A_{n}^{(k)}\}_{k \in \mathbb{Z}}))_{\tilde{q}, q} = l_{q}(\{(A_{0}^{(k)}, ..., A_{n}^{(k)})_{\tilde{q}, q}\}_{k \in \mathbb{Z}})
\]

under the condition

\[
A_{n}^{(k)} = c^{k}(A_{0}^{(k)}, ..., A_{n-1}^{(k)})_{\tilde{x}, q}.
\]

Then we have

\[
(4.3) \quad (l_{p}(\{A_{0}^{(k)}\}_{k \in \mathbb{Z}}), ..., l_{p}(\{A_{n}^{(k)}\}_{k \in \mathbb{Z}}))_{\tilde{q}, q} = (l_{p}(\{A_{0}^{(k)}\}_{k \in \mathbb{Z}}), ..., l_{p}(\{c^{k}(A_{0}^{(k)}, ..., A_{n-1}^{(k)})_{\tilde{x}, q}\}_{k \in \mathbb{Z}}))_{\tilde{q}, q}.
\]

Now we will use our Theorem 2 and the reiteration theorem (see Theorem 1). Let us first notice that we can find \( \tilde{\eta} = (\eta_0, \eta_1, ..., \eta_n) \) and \( \tilde{c} \neq 1 \) such that

\[
(4.4) \quad (A_{0}^{(k)}, ..., A_{n-1}^{(k)}, \tilde{c}^{k}A_{n-1}^{(k)})_{\tilde{\eta}, p} = c^{k}(A_{0}^{(k)}, ..., A_{n-1}^{(k)})_{\tilde{x}, p}.
\]

Equality \((4.4)\) is equivalent to

\[
(4.5) \quad (\eta_0, \eta_1, ..., \eta_{n-2}, \eta_{n-1} + \eta_n) = \tilde{x} \quad \text{and} \quad \tilde{c}^{n} = c,
\]

and \((4.5)\) clearly has a solution for given \( \tilde{x} \) and \( c \) and the solution is not unique. Moreover, from Theorem 2 it follows that

\[
(4.6) \quad l_{p}(\{A_{0}^{(k)}\}_{k \in \mathbb{Z}}), ..., l_{p}(\{A_{n}^{(k)}\}_{k \in \mathbb{Z}}))_{\tilde{q}, p} = l_{p}(\{A_{0}^{(k)}, ..., A_{n}^{(k)}, \tilde{c}^{k}A_{n-1}^{(k)}\}_{\tilde{\eta}, p}) = l_{p}(\{c^{k}(A_{0}^{(k)}, ..., A_{n-1}^{(k)})_{\tilde{x}, p}\}).
\]

Therefore, denoting \( B_i = l_{p}(\{A_{i}^{(k)}\}_{k \in \mathbb{Z}}), i = 0, ..., n-1, \) and \( B_n = l_{p}(\{c^{k}A_{n-1}^{(k)}\}) \) and using \((4.6)\) we can rewrite the right-hand side in \((4.3)\) as

\[
(4.7) \quad (l_{p}(\{A_{0}^{(k)}\}_{k \in \mathbb{Z}}), ..., l_{p}(\{A_{n-1}^{(k)}\}_{k \in \mathbb{Z}}), l_{p}(\{c^{k}(A_{0}^{(k)}, ..., A_{n-1}^{(k)})_{\tilde{x}, p}\}))_{\tilde{q}, q} = (B_0, B_1, ..., B_{n-1}, (B_0, B_1, ..., B_{n-1}, B_n)_{\tilde{\eta}, p})_{\tilde{q}, q}.
\]

As the spaces \( B_i \) are functional Banach lattices on the measure space \((\Omega, \mu)\), where \( \Omega \) is constructed as a disjoint union of \( \Omega_i \) (disjoint means that \( \Omega_i \) does not intersect...
with $\Omega_j$ for $j \neq i$) with the measure $\mu = \sum_j \mu_j$, therefore we can use the reiteration theorem (see Theorem 1) and Theorem 2 to obtain
\begin{equation}
(B_0, B_1, ..., B_{n-1}, (B_0, B_1, ..., B_{n-1}, B_n)_{\tilde{\gamma}, q}) = (B_0, B_1, ..., B_{n-1}, B_n)_{\tilde{\gamma}, q}
= (l_p(A_0^{(k)}), ..., l_p(A_{n-1}^{(k)}), l_p(\tilde{c}^{k} A_{n-1}^{(k)}))_{\tilde{\gamma}, q}
= l_q((\tilde{A}_0^{(k)}, ..., \tilde{A}_{n-1}^{(k)}, \tilde{c}^{k} A_{n-1}^{(k)}))_{\tilde{\gamma}, q})
\end{equation}
where
\[\tilde{\gamma} = (\theta_0 + \eta_0 \theta_n, ..., \theta_{n-1} + \eta_{n-1} \theta_n, \eta_n \theta_n)\].

So we have proved the equality
\[l_p(A_0^{(k)}), ..., l_p(A_{n}^{(k)}))_{\tilde{\gamma}, q} = l_q((\tilde{A}_0^{(k)}, ..., \tilde{A}_{n-1}^{(k)}, \tilde{c}^{k} A_{n-1}^{(k)}))_{\tilde{\gamma}, q})\).

Since from the reiteration theorem it follows (compare with (4.8)) that
\[\begin{align*}
(A_0^{(k)}, ..., A_{n-1}^{(k)}, c^k (A_0^{(k)}, ..., A_{n-1}^{(k)})_{\tilde{\gamma}, q}) = \\
(\tilde{A}_0^{(k)}, ..., \tilde{A}_{n-1}^{(k)}, \tilde{c}^k A_{n-1}^{(k)})_{\tilde{\gamma}, q} = (A_0^{(k)}, ..., A_{n-1}^{(k)}, c^k A_{n-1}^{(k)})_{\tilde{\gamma}, q},
\end{align*}\]
then
\[l_p(A_0^{(k)}), ..., l_p(A_{n}^{(k)}))_{\tilde{\gamma}, q} = l_q((\tilde{A}_0^{(k)}, ..., \tilde{A}_{n-1}^{(k)}, \tilde{c}^k A_{n-1}^{(k)}))_{\tilde{\gamma}, q})\).

**Corollary 1.** Suppose that $A_0^{(k)}, ..., A_{n-1}^{(k)}$ are functional Banach or quasi-Banach lattices on $(\Omega_k, \mu_k)$ and $A_n^{(k)} = c^k (A_0^{(k)}, ..., A_{n-1}^{(k)})_{\tilde{\lambda}, p}$ for all $k \in \mathbb{Z}$ and fixed $\tilde{\lambda}, p$ and some positive $c \neq 1$. Then
\[l_p(A_0^{(k)}), ..., l_p(A_{n}^{(k)}))_{\tilde{\gamma}, q} = l_q((\tilde{A}_0^{(k)}, ..., \tilde{A}_{n-1}^{(k)}, \tilde{c}^k A_{n-1}^{(k)}))_{\tilde{\gamma}, q})\).

**Proof.** Apply the theorem with $r_0 = r_1 = p$. □

**Remark 2.** Formula (1.4) from the Introduction with the restriction (1.6) is a particular case of Corollary 1. Indeed, we only need to take $A_i^{(k)} = 2^{s_k} A_i, i = 0, ..., n - 1$. Then from (1.6), it follows that
\[A_n^{(k)} = 2^{s_k} A_n = 2^{s_k} (A_0, ..., A_{n-1})_{\tilde{\lambda}, p}
= 2^{(s_0 - \lambda_0 s_0 - ... - \lambda_{n-1} s_{n-1})} (A_0, ..., A_{n-1})_{\tilde{\lambda}, p}.
\]
As $s_n \neq \lambda_0 s_0 + ... + \lambda_{n-1} s_{n-1}$ (see (1.6)), we have $c = 2^{(s_0 - \lambda_0 s_0 - ... - \lambda_{n-1} s_{n-1})}$ not equal to 1.

**Remark 3.** Instead of the property that $A_0^{(k)}, ..., A_{n-1}^{(k)}$ are functional Banach or quasi-Banach lattices on $(\Omega_k, \mu_k)$ for each $k \in \mathbb{Z}$ it is enough to have that the reiteration theorem is valid for the collections $(A_0^{(k)}, ..., A_{n-1}^{(k)})$ and for all collections of the type $(l_p(A_0^{(k)}), ..., l_p(A_{n-1}^{(k)}))$.\]
