MOMENT PROBLEM WITH CONTRACTIVE SOLUTIONS:
THE REGULAR CASE

ZENON J. JABŁONSKI

(Communicated by Joseph A. Ball)

Abstract. An operator multivariate moment problem with contractive solutions having regular unitary dilation is characterized in terms of the initial data. This extends a recent result of Sebestyén and Popovici, but the ideas of our proof differ from those used by them. The connection between the operator multivariate moment problem and harmonizable multivariate discrete processes is mentioned.

1. From now on $\mathcal{D}$ stands for a complex inner product space and $\mathcal{H}$ for a complex Hilbert space. Let us denote by $L(\mathcal{D}, \mathcal{H})$ (resp. $B(\mathcal{D}, \mathcal{H})$) the set of all linear (resp. bounded linear) operators from $\mathcal{D}$ to $\mathcal{H}$. For simplicity we write $B(\mathcal{H})$ instead of $B(\mathcal{H}, \mathcal{H})$; $I_\mathcal{D}$ stands for the identity operator on $\mathcal{D}$. For $T \in L(\mathcal{D}, \mathcal{H})$, we set $\mathcal{R}(T) = T(\mathcal{D})$.

Let $\mathbb{Z}$ stand for the additive group of all integers. Assume that $\Omega$ is a nonempty set. Denote by $\mathbb{Z}[\Omega]$ the group which is the direct sum of $\text{card}(\Omega)$ copies of the additive group $\mathbb{Z}$; that is, $\mathbb{Z}[\Omega]$ is the set of all functions $m : \Omega \to \mathbb{Z}$ of finite support $\{\alpha \in \Omega : m(\alpha) \neq 0\}$ equipped with a pointwise defined group operation. The zero function is a neutral element of $\mathbb{Z}[\Omega]$. If $\Xi$ is a subset of $\Omega$, then we can think of $\mathbb{Z}[\Xi]$ as a subset of $\mathbb{Z}[\Omega]$.

Let

$$\mathbb{Z}[\Omega]_+ = \{m \in \mathbb{Z}[\Omega] : m(\alpha) \geq 0 \text{ for all } \alpha \in \Omega\}.$$ 

For $n \in \mathbb{Z}$, we set $n^+ = \max\{n, 0\}$ and $n^- = -\min\{n, 0\}$. Given $m \in \mathbb{Z}[\Omega]$, we denote by $m^+, m^- \in \mathbb{Z}[\Omega]_+$ the positive and the negative parts of $m$, i.e.,

\[
\begin{align*}
m^+(\alpha) & \overset{\text{df}}{=} (m(\alpha))^+, \quad \alpha \in \Omega, \\
m^-(\alpha) & \overset{\text{df}}{=} (m(\alpha))^-, \quad \alpha \in \Omega.
\end{align*}
\]

For a finite subset $v$ of $\Omega$, we define the function $e_v \in \mathbb{Z}[\Omega]_+$ by

\[
e_v(\beta) = \begin{cases} 1 & \text{if } \beta \in v, \\
0 & \text{if } \beta \notin v,
\end{cases}
\]

and set \( e_\alpha = e_{\{\alpha\}} \) for \( \alpha \in \Omega \).

Let \( T = \{T_\alpha\}_{\alpha \in \Omega} \subset B(\mathcal{H}) \) be a family of commuting operators. Set

\[
T^m = \prod_{\alpha \in \Omega} T'^m(\alpha), \quad m \in \mathbb{Z}_{\Omega^+}.
\]

We say that \( T \) has a \textit{unitary dilation} if there exists a complex Hilbert space \( \mathcal{K} \supset \mathcal{H} \) (isometric embedding) and a family \( U = \{U_\alpha\}_{\alpha \in \Omega} \subset B(\mathcal{K}) \) of commuting unitary operators such that

\[
T^m = P \left[ U^m \right]_{\mathcal{H}}, \quad m \in \mathbb{Z}_{\Omega^+},
\]

where \( P \) is the orthogonal projection of \( \mathcal{K} \) onto \( \mathcal{H} \). If moreover

\[
(T^m)^* T^m = P \left[ U^m \right]_{\mathcal{H}}, \quad m \in \mathbb{Z}_{\Omega^+},
\]

then we say that \( T \) has a \textit{regular unitary dilation}. Regular dilations were introduced by Brehmer [1]. Let us recall that this type of dilations has been studied in [19] [7] [3] [6] [21] [4] [10] [11] [12].

Let \( X \) be an arbitrary nonempty set. An operator moment problem considered in this paper entails determining whether, for a given family \( \{A^x_m\}_{x \in X} \subset L(\mathcal{D}, \mathcal{H}) \) of operators, there exists a family \( T = \{T_\alpha\}_{\alpha \in \Omega} \subset B(\mathcal{H}) \) of commuting contractions having a regular unitary dilation and such that

\[
A^x_m = T^m A^x_0, \quad m \in \mathbb{Z}_{\Omega^+}, \quad x \in X.
\]

The moment problem (1) has been considered and solved by Popovici [12] (see also [11] for the vector case) in the case that the operator data \( \{A^x_{m,n}\}_{(m,n) \in \mathbb{Z}^2} \) are a bounded double-indexed sequence (see also [15] [16] [6] [17] in the case in which \( \text{card}(X) = 1 \)). The multidimensional vector moment problem with \( \text{card}(X) = 1 \) has been solved by Z. Sebestyén and Popovici in [13]. By contrast to the method used in [12], which relies on the results of [15] [4] and does not seem to be easily generalizable to the case of an arbitrary family of operators, our technique (cf. proof of Theorem 4) enables us to fully solve problem (1).

It turns out that the moment problem (1) is connected with the concept of so-called weak operator harmonizability\(^1\) of regular type. More precisely, if \( T = \{T_\alpha\}_{\alpha \in \Omega} \subset B(\mathcal{H}) \) is a family of commuting contractions having a regular unitary dilation and \( A_0 \in L(\mathcal{D}, \mathcal{H}) \), then the process \( \{T^m A_0\}_{m \in \mathbb{Z}_{\Omega^+}} \) is weak operator harmonizable of regular type (cf. [12]; see also [9] [8] for more details). Hence, if our problem attached to the family \( \{A^x_m\}_{x \in X} \subset L(\mathcal{D}, \mathcal{H}) \) has a solution, then each process in the family is weak operator harmonizable of regular type.

2. In what follows, we write \( D(\Xi) \) for the set of all maps \( f : \Xi \to D \) with finite support (\( \Xi \) is an arbitrary nonempty set).

The following lemma characterizes families of operators having regular unitary dilations.

\textbf{Lemma 1} ([1]; see also [7] [20]). Let \( T = \{T_\alpha\}_{\alpha \in \Omega} \subset B(\mathcal{H}) \) be a commuting family of operators. Then the following conditions are equivalent:

(a) \( T \) has a regular unitary dilation;

\(^1\) The notion of a harmonizable process has been introduced in [14] by Rozanov.
Lemma 2. Let $\mathcal{T} = \mathcal{T}(\mathbb{Z}[\Omega]_+)$ be a contraction satisfying (2). Since the map $f, g \in \mathcal{T}$ are positive definite.

(c) Let $f \in \mathcal{H}$ be a vector and for any vector $f \in \mathcal{H}$ the following inequality holds:

$$\sum_{v \subseteq u} (-1)^{|v|} \| T^v f \|^2 \geq 0,$$

where $|v|$ denotes the number of elements of $v$.

Given a family $\{ A^x_m \}_{m \in \mathbb{Z}[\Omega]_+} \subseteq L(\mathbb{D}, \mathcal{H})$, we set

$$R_x \triangleq \lim \bigcup_{m \in \mathbb{Z}[\Omega]_+} A^x_m(\mathbb{D}), \quad \mathcal{H}_x = \overline{R_x}.$$

The next lemma is an extension of [17, Theorem 3.1] and [8, Lemma 4] to the arbitrary nonempty index set $X$. It may be proved in a similar way as [8, Lemma 4]. However, for the convenience of the reader, we give the proof of this lemma for our case.

**Lemma 2.** Let $\{ A^x_m \}_{m \in \mathbb{Z}[\Omega]_+} \subseteq L(\mathbb{D}, \mathcal{H})$. Then for every $\alpha \in \Omega$ the following conditions are equivalent:

(i) there exists a contraction $T_\alpha \in B(\mathcal{H})$ such that

[Formula]

(ii) for any integer $c \geq 1$ and for all maps $h_1, \ldots, h_c \in \mathcal{D}[\mathbb{Z}[\Omega]_+ \times X]$,

$$\sum_{k,l=1}^{c} \sum_{x \in X} \sum_{m,n \in \mathbb{Z}[\Omega]_+} \langle A^x_{k,l} e_m h_{k,m} h_{l,n} \rangle \geq 0;$$

(ii) for all maps $h_1, h_2 \in \mathcal{D}[\mathbb{Z}[\Omega]_+ \times X]$,

$$\sum_{k,l=1}^{2} \sum_{x \in X} \sum_{m,n \in \mathbb{Z}[\Omega]_+} \langle A^x_{k,l} e_m h_{k,m} h_{l,n} \rangle \geq 0;$$

(iii) for any map $h \in \mathcal{D}[\mathbb{Z}[\Omega]_+ \times X]$,

$$\sum_{x \in X} \sum_{m \in \mathbb{Z}[\Omega]_+} A^x_m h(m,x) \leq \sum_{x \in X} \sum_{m \in \mathbb{Z}[\Omega]_+} A^x_m h(m,x).$$

Moreover, if any of the conditions (ii), (ii), (iii) holds for every $\alpha \in \Omega$, then there exists a family $\{ T_\alpha \}_{\alpha \in \Omega} \subseteq B(\mathcal{H})$ of commuting contractions satisfying [2]....

**Proof.** (i) $\Rightarrow$ (ii). Let $T_\alpha \in B(\mathcal{H})$ be a contraction satisfying [2]. Since the map

$$\mathbb{Z} \ni n \rightarrow \begin{cases} T_\alpha^n & \text{if } n \geq 0 \\ T_\alpha^{|n|} & \text{if } n < 0 \end{cases}$$

The condition (b) is equivalent to requiring that the form $\omega : \mathbb{Z}[\Omega] \times \mathcal{H} \times \mathcal{H} \ni (n, f, g) \rightarrow \langle (T^m)^* T^n f, g \rangle \in \mathbb{C}$ is positive definite.
Theorem 4. Suppose we are given a family \( \{A_m\}_{m \in \mathbb{Z}[\Omega]} \) \( \supseteq \mathcal{L}(\mathcal{D}, \mathcal{H}) \). Then the following conditions are equivalent:

(i) there exists a family \( \mathbf{T} = \{T_\alpha\}_{\alpha \in \Omega} \subseteq \mathcal{B}(\mathcal{H}) \) of commuting contractions having a regular unitary dilation and such that (1) holds:

\[
\sum_{\alpha \in \Omega} \sum_{n \in \mathbb{Z}[\Omega]} \langle A_x^{(m-n)} + s h(m, s, x), A_y^{(m-n)} + t h(n, t, y) \rangle \geq 0;
\]

(ii) for any map \( h \in \mathcal{D}[\mathbb{Z}[\Omega]_+ \times \mathbb{Z}[\Omega]_+ \times X] \) the following inequality holds:

\[
0 \leq \sum_{k,l=1}^c (T_\alpha^{(k-l)})^+ \sum_{x \in X} A_x^m h_k(m, x), T_\alpha^{(k-l)-} \sum_{y \in X} A_y^n h_l(n, y)) = \sum_{k,l=1}^c \sum_{m,n \in \mathbb{Z}[\Omega]} \langle A_x^{(k-l)-} h_\alpha(m, x), A_y^{(l-k)-} h_\alpha(n, y) \rangle.
\]

The implication (ii)\( \Rightarrow \) (i) is obvious.

(iii)\( \Rightarrow \) (ii\'). The inequality (3) can be rewritten in the following form:

\[
\|g_1\|^2 + \|g_2\|^2 + 2 \Re \langle g_1, g_2 \rangle \geq 0,
\]

where \( g_1 \equiv \sum_{x \in X} A_x^m h_1(m, x) \) and \( g_2 \equiv \sum_{x \in X} A_x^m h_2(m, x) \). Set \( h \in \mathcal{D}[\mathbb{Z}[\Omega]_+ \times X] \) and define \( h_1, h_2 \in \mathcal{D}[\mathbb{Z}[\Omega]_+ \times X] \) by \( h_2 = h \) and

\[
h_1(m, x) = \begin{cases} -h(m - e_\alpha, x) & \text{if } m - e_\alpha \in \mathbb{Z}[\Omega]_+ \\ 0 & \text{otherwise.} \end{cases}
\]

A short computation shows that \( g_1 = -g_2 \). This and (6) yield \( \|g_2\|^2 \leq \|g_2\|^2 \), which implies (1).

(iii)\( \Rightarrow \) (i). By virtue of (iii) there exists a unique contraction \( \tilde{T}_\alpha \in \mathcal{B}(\mathcal{H}) \) such that \( \tilde{T}_\alpha A_x^m f = A_x^m h_\alpha(m, x) \) for all \( m \in \mathbb{Z}[\Omega]_+, x \in X \) and \( f \in \mathcal{D} \). Define the operator \( T_\alpha \in \mathcal{B}(\mathcal{H}) \) by \( T_\alpha = \tilde{T}_\alpha \oplus I_{\mathcal{H}} \). Then \( T_\alpha \) is a contraction, which satisfies (2). Moreover, if this is done for every \( \alpha \in \Omega \), then the operators \( T_\alpha, \alpha \in \Omega \), commute. This completes the proof. \( \square \)

Remark 3. Regarding Lemma (2) (as well as Theorem 4 and Corollary 5), one can check that if \( \mathcal{H}_A = \mathcal{H} \), then there exists at most one operator \( T_\alpha \in \mathcal{B}(\mathcal{H}) \) satisfying (2). On the other hand, if there exists exactly one operator \( T_\alpha \in \mathcal{B}(\mathcal{H}) \) satisfying (2), then \( \mathcal{H}_A = \mathcal{H} \).

3. We are now ready to prove the main result of the paper.

Theorem 4. Suppose we are given a family \( \{A_m\}_{m \in \mathbb{Z}[\Omega]} \subset \mathcal{L}(\mathcal{D}, \mathcal{H}) \). Then the following conditions are equivalent:

(i) there exists a family \( \mathbf{T} = \{T_\alpha\}_{\alpha \in \Omega} \subseteq \mathcal{B}(\mathcal{H}) \) of commuting contractions having a regular unitary dilation and such that (1) holds:

(ii) for any map \( h \in \mathcal{D}[\mathbb{Z}[\Omega]_+ \times \mathbb{Z}[\Omega]_+ \times X] \) the following inequality holds:

\[
\sum_{x,y \in X} \sum_{m,n \in \mathbb{Z}[\Omega]} \langle A_x^{(m-n)} + s h(m, s, x), A_y^{(m-n)} + t h(n, t, y) \rangle \geq 0;
\]

(iii) for any map \( h \in \mathcal{D}[\mathbb{Z}[\Omega]_+ \times X] \) and for any finite subset \( u \) of \( \Omega \) the following inequality holds:

\[
\sum_{v \leq u} (-1)^{|v|} \sum_{m \in \mathbb{Z}[\Omega]} \| A_x^{e_\alpha + m} h(m, x) \|^2 \geq 0.
\]
Before going to the proof, it is worth noting that the above theorem extends [12] Theorem 3.1, but the ideas of our proof differ from those used by Popovici.

**Proof.** (i)⇒(ii). Take \( h \in \mathcal{D}[\mathbb{Z}[\Omega]_+ \times \mathbb{Z}[\Omega]_+ \times X] \). Define \( f \in \mathcal{H}[\mathbb{Z}[\Omega]_+] \) by

\[
f(m) = \sum_{s \in \mathbb{Z}[\Omega]_+} A_s^x h(m, s, x), \quad m \in \mathbb{Z}[\Omega]_+.
\]

Applying the implication (a)⇒(b) of Lemma 1 and using (1) we get

\[
0 \leq \sum_{m,n \in \mathbb{Z}[\Omega]_+} \langle T^{(m-n)+} f(m), T^{(m-n)-} f(n) \rangle
= \sum_{m,n \in \mathbb{Z}[\Omega]_+} \langle T^{(m-n)+} \sum_{x \in X} A_s^x h(m, s, x), T^{(m-n)-} \sum_{y \in X} A_t^y h(n, t, y) \rangle
= \sum_{x,y \in X} \sum_{m,n \in \mathbb{Z}[\Omega]_+} \langle T^{(m-n)+} A_s^x h(m, s, x), T^{(m-n)-} A_t^y h(n, t, y) \rangle
= \sum_{x,y \in X} \sum_{m,n \in \mathbb{Z}[\Omega]_+} \langle A_{(m-n)+}^s h(m, s, x), A_{(m-n)-}^t h(n, t, y) \rangle.
\]

(ii)⇒(i). Take \( \alpha \in \Omega \) and \( h_1, h_2 \in \mathcal{D}[\mathbb{Z}[\Omega]_+ \times X] \). Define \( f : \mathbb{Z}[\Omega]_+ \times \mathbb{Z}[\Omega]_+ \times X \to \mathcal{D} \) by

\[
f(m, s, x) = \begin{cases} h_1(s, x) & m = e_\alpha, \\ h_2(s, x) & m = 2e_\alpha, \\ 0 & \text{otherwise.} \end{cases}
\]

Hence, by (ii), we get

\[
0 \leq \sum_{x,y \in X} \sum_{m,n \in \mathbb{Z}[\Omega]_+} \langle A_{(m-n)+}^s f(m, s, x), A_{(m-n)-}^t f(n, t, y) \rangle
= \sum_{k,l=1}^2 \sum_{x \in X} \sum_{s,t \in \mathbb{Z}[\Omega]_+} \langle A_{(k-l)+} e_\alpha + h_k(s, x), A_{(k-l)-} e_\alpha + h_l(t, y) \rangle.
\]

According to Lemma 2 there exists a family \( \overline{T} = \{ \overline{T}_\alpha \}_{\alpha \in \Omega} \subset B(\mathcal{H}_\alpha) \) of commuting contractions such that \( \overline{T}_\alpha A_m^x = A_{e_\alpha + m}^x \) for all \( \alpha \in \Omega, \ x \in X \) and \( m \in \mathbb{Z}[\Omega]_+ \).

Arguing as in the proof of the implication (i)⇒(ii) we show that for any map \( f \in \mathcal{R}_\alpha[\mathbb{Z}[\Omega]_+] \) the following inequality holds:

\[
\sum_{m,n \in \mathbb{Z}[\Omega]_+} \langle T^{(m-n)+} f(m), T^{(m-n)-} f(n) \rangle \geq 0.
\]

Exploiting the continuity of \( \overline{T}_\alpha \) and applying the implication (b)⇒(a) of Lemma 1 we deduce that the family \( \overline{T} \) has a regular unitary dilation. As a consequence, the family \( T = \{ T_\alpha \}_{\alpha \in \Omega} \subset B(\mathcal{H}) \) defined by

\[
T_\alpha = \overline{T}_\alpha \oplus I_{\mathcal{H} \otimes \mathcal{H}_\alpha}, \quad \alpha \in \Omega,
\]

has all the required properties listed in (i).
(i)⇒(iii). Take \( h \in \mathcal{D}[\mathcal{Z}[\Omega_+] \times X] \) and a finite subset \( u \) of \( \Omega \). Define \( f \in \mathfrak{H} \) by
\[
f = \sum_{x \in X} \sum_{m \in \mathcal{Z}[\Omega_+]} A^x_m h(m, x).
\]
Applying the implication (a)⇒(c) of Lemma 1 and using (I) we get
\[
0 \leq \sum_{v \subseteq u} (-1)^{|v|} \| T^e_v f \|^2 = \sum_{v \subseteq u} (-1)^{|v|} \sum_{x \in X} \sum_{m \in \mathcal{Z}[\Omega_+]} T^e_v A^x_m h(m, x) \|^2
\]
\[
= \sum_{v \subseteq u} (-1)^{|v|} \sum_{x \in X} \sum_{m \in \mathcal{Z}[\Omega_+]} A^x_{e_v + m} h(m, x) \|^2.
\]

(iii)⇒(i). Take \( \alpha \in \Omega \). It follows from (iii) with \( u \equiv \{ \alpha \} \) that the condition (iii) of Lemma 2 holds. Hence, by Lemma 2 there exists a unique family \( \mathcal{T} = \{ \tilde{T}_\alpha \}_{\alpha \in \Omega} \subset \mathcal{B}(\mathfrak{H}) \) of commuting contractions such that \( \tilde{T}_\alpha A^x_m = A^x_{e_\alpha + m} \) for all \( \alpha \in \Omega \), \( m \in \mathcal{Z}[\Omega_+] \) and \( x \in X \). Arguing as in the proof of the implication (i)⇒(iii) we show that for any finite subset \( u \) of \( \Omega \) and for any vector \( f \in \mathfrak{R}_\mathfrak{A} \) the following inequality holds:
\[
\sum_{v \subseteq u} (-1)^{|v|} \| T^e_v f \|^2 \geq 0.
\]

Exploiting the continuity of \( \tilde{T}_\alpha \) and applying the implication (c)⇒(a) of Lemma 1 we deduce that the family \( \mathcal{T} \) has a regular unitary dilation. As a consequence, the family \( \mathcal{T} = \{ T_\alpha \}_{\alpha \in \Omega} \subset \mathcal{B}(\mathfrak{H}) \) defined by \( T_\alpha = \tilde{T}_\alpha \oplus I_\mathfrak{H} \otimes \mathfrak{J}_\mathfrak{A} \), \( \alpha \in \Omega \), has all the required properties listed in (i).

Our Theorem 4 includes the solution of the vector moment problem as a particular case (by identifying vectors \( h_x \) with operators \( A_x : \mathcal{C} \to \mathfrak{H} \), \( h_y = \lambda h_x \), \( \lambda \in \mathcal{C} \)), which generalizes [11, Theorem 3.1] and [13, Theorem C]. More precisely, we get the following.

**Corollary 5.** Suppose we are given a family \( \{ h^x_m \}_{m \in \mathcal{Z}[\Omega_+]} \subset \mathfrak{H} \). Then the following conditions are equivalent:

(i) there exists a family \( \mathcal{T} = \{ T_\alpha \}_{\alpha \in \Omega} \subset \mathcal{B}(\mathfrak{H}) \) of commuting contractions having a regular unitary dilation and such that
\[
h^x_m = T^m h^x_0, \quad m \in \mathcal{Z}[\Omega_+], \quad x \in X;
\]
(ii) for any map \( c \in \mathcal{C}[\mathcal{Z}[\Omega_+] \times \mathcal{Z}[\Omega_+] \times X] \) the following inequality holds:
\[
\sum_{x,y \in X} \sum_{m,n \in \mathcal{Z}[\Omega_+]} c(m, s, x) c(n, t, y) (h^x_{(m-n)_-+s}, h^y_{(m-n)_-+t}) \geq 0;
\]
(iii) for any map \( c \in \mathcal{C}[\mathcal{Z}[\Omega_+] \times X] \) and for any finite subset \( u \) of \( \Omega \) the following inequality holds:
\[
\sum_{v \subseteq u} (-1)^{|v|} \sum_{x \in X} \sum_{m \in \mathcal{Z}[\Omega_+]} c(m, x) h^x_{e_v + m} \|^2 \geq 0.
\]

It turns out that Corollaries 9 and 10 of [8], with the appropriate changes, are also valid in the case of the regular dilation.
4. Let us recall (cf. [8, Theorem 7]) that a family of operators is of the form

\[
A^x_m = T^m A^0_0, \quad m \in \mathbb{Z}^+ \Omega,
\]

where \( T = \{T_\alpha\}_{\alpha \in \Omega} \subset B(\mathcal{H}) \) is a family of commuting contractions having a unitary dilation (not necessarily regular ones), if and only if the following condition holds:

(iii) for any integer \( c \geq 1 \) and for all maps \( h_1, \ldots, h_c \in \mathcal{D}[\mathbb{Z}^+ \Omega^2] \) such that

\[
\sum_{j=1}^{c} \sum_{m \in \mathbb{Z}^+ \Omega} \sum_{s,t \in \mathbb{Z}^+ \Omega} (A_0 h_j(m, s)) \otimes (A_t h_j(n, t)) = 0,
\]

\[
u \in \left( \mathbb{Z}^+ \Omega \setminus (\mathbb{Z}^+ \Omega + (\mathbb{Z}^+ \Omega)^2) \right),
\]
the following inequality holds:
\[
\sum_{j=1}^{c} \sum_{m, n \in \mathbb{Z}[\Omega]_+} \langle A_{(m-n)^+}b_j(m, s), A_{(m-n)^+}b_j(n, t) \rangle \geq 0.
\]
Comparing it to our condition (ii) of Theorem 4 (with \text{card}(X) = 1), it is evident that the condition (ii) of Theorem 4 implies (ii*).
