ON A PROBLEM OF AXLER, CUCKOVIC AND RAO

GUANGFU CAO

(Communicated by Joseph A. Ball)

Abstract. In this note we show that if two Toeplitz operators on a Bergman space of the (Levi) pseudoconvex domain commute and the symbol of one of them is analytic and non-constant, then the other one is also analytic. This gives an affirmative answer of a problem of S. Axler, Z. Cuckovic and N. V. Rao (1999).

1. Introduction

Let Ω be a domain in \( \mathbb{C}^n \) and \( dV_n \) denote the Lebesgue measure on Ω. The Bergman space \( L^2_a(\Omega) \) is the subspace of \( L^2(\Omega, dV_n) \) consisting of the square-integrable functions that are analytic on Ω. Write the orthogonal projection of \( L^2(\Omega, dV_n) \) onto \( L^2_a(\Omega) \) by \( P \), for any bounded measurable function \( \varphi \) on \( \Omega \), define the Toeplitz operator \( T_\varphi \) with symbol \( \varphi \) on \( L^2_a(\Omega) \) as

\[
T_\varphi(f) = P(\varphi f) \quad (\forall f \in L^2_a(\Omega)).
\]

In the case of the Hardy space of the unit circle, Brown and Halmos [3] proved the following theorem.

**Theorem 1.** If the Toeplitz operators \( T_\varphi \) and \( T_\psi \) commute on the Hardy space, then (1) either both symbols are analytic, (2) both symbols are conjugate analytic, or (3) \( a\varphi + b\psi \) is constant for some constants \( a, b \) not both 0.

Cowen [4] and Thomson [8], [9] obtained more general results concerning which operators, not necessarily Toeplitz, commute with an analytic Hardy space Toeplitz operator on the Hardy space of the unit circle.

In [1], S. Axler, Z. Cuckovic and N. V. Rao proved the following theorem.

**Theorem 2.** Let \( \Omega \) be a bounded open domain in the complex plane. Suppose that \( \varphi \) is a non-constant bounded analytic function on \( \Omega \) and that \( \psi \) is a bounded measurable function on \( \Omega \) such that \( T_\varphi \) and \( T_\psi \) commute. Then \( \psi \) is analytic.

Their proof depends on the following approximation theorem due to Bishop [2].

**Theorem 3.** Let \( \varphi \) be a non-constant bounded analytic function on \( \Omega \). Then the norm-closed subalgebra of \( L^\infty(\Omega, dA) \) generated by \( \varphi \) and the bounded analytic functions on \( \Omega \) contain \( C(\Omega) \).

Problem. What is the situation on Bergman space in higher dimensions?

For the general domains, the problem has a negative answer. The main result [7] gives that on the bidisk $D^2$, $T_{z_1}$ commutes with $T_{\overline{z}_2}$ on the Bergman space. Hence the problem depends deeply on the geometric structure of domains. There are two great differences between one complex variable and several complex variables for handling the problem:

1. If $\varphi$ is an analytic function on the unit disk $D$, then for any $\lambda \in \mathbb{C}$, $\{z \ | \ \varphi(z) = \lambda\}$ has no limit point in $D$. However, if $\varphi$ is an analytic function on the unit ball $B_n$, then for any $\lambda \in \mathbb{C}$, $\{z \ | \ \varphi(z) = \lambda\}$ may be a $k$-dimensional manifold ($k < n$).

2. In the case of a domain for several complex variables, if $f$ is a $(p, q)$-form with $C^\infty$-coefficients on the domain which satisfies $\overline{\partial}f = 0$, there may be no $(p, q-1)$-form $g$ such that $\overline{\partial}g = f$. In general, one needs the domain to be at least pseudoconvex. Here we say that $\Omega$ is (Levi) pseudoconvex if $\Omega \Subset \mathbb{C}^n$ has $C^2$-boundary (where $\Omega \Subset \mathbb{C}^n$ means that $\Omega$ is relatively compact in $\mathbb{C}^n$; that is, the closure $\overline{\Omega}$ of $\Omega$ is a compact subset of $\mathbb{C}^n$) i.e., there is a defining function $\rho$ on a neighborhood $W$ of $\partial \Omega$ so that $\rho$ is of class $C^2$, $\Omega \cap W = \{z \in W \ | \ \rho(z) < 0\}$, and grad $\rho \neq 0$ on $\partial \Omega$, where grad $\rho$ denotes the gradient of $\rho$, and for each $z \in \partial \Omega$ and each $w \in \mathbb{C}^n$ satisfying $\sum_{j=1}^n [\frac{\partial \rho(z)}{\partial z_j}] w_j = 0$, one has

$$\sum_{j,k=1}^n \frac{\partial^2 \rho(z)}{\partial z_j \partial \overline{z}_k} w_j w_k \geq 0$$

for any defining function $\rho$ for $\Omega$. For more details about pseudoconvex domains, see [5].

The key to solving the problem is to establish an analogue of Bishop’s theorem in higher dimension. In the present note, we obtain a weak form of Bishop’s theorem [2] to pseudoconvex domains in $\mathbb{C}^n$, and hence give an affirmative answer to the problem of Axler, Cuckovic and Rao.

2. Main result

In this section we will state and prove the main result in the paper. First we need the following lemma, which is Corollary 4.6.12 in [5].

Lemma 4. If $\Omega \subseteq \mathbb{C}^n$ is pseudoconvex and $f$ is a $(p, q+1)$ form on $\Omega$ with $C^\infty$-coefficients and satisfying $\overline{\partial}f = 0$, then there is a $(p, q)$ form $u$ on $\Omega$ with $C^\infty$-coefficients satisfying $\overline{\partial}u = f$.

The $(p, q)$ form $f$ satisfying $\overline{\partial}f = 0$ is also called a close $(p, q)$ form. The following theorem extends Bishop’s theorem [2] to pseudoconvex domains in $\mathbb{C}^n$ in a weak form. But it is good enough for us to solve the problem of Axler, Cuckovic and Rao.

For any bounded pseudoconvex domain $\Omega$ in $\mathbb{C}^n$, let $H^\infty(\Omega)[\varphi]$ denote the subalgebra of $L^\infty(\Omega, dV_n)$ generated by $\varphi$ and $H^\infty(\Omega)$.

Theorem 5. Suppose $\Omega$ is a bounded pseudoconvex domain in $\mathbb{C}^n$ and $\varphi \in H^\infty(\Omega)$ is non-constant on $\Omega$. Then $C(\overline{\Omega}) \subset L^2_a(\Omega)[\varphi]$, where $L^2_a(\Omega)[\varphi]$ denotes the closure in $L^2(\Omega, dV_n)$ of the algebra $H^\infty(\Omega)[\varphi]$. 

Proof. Take $g$ in $C(\bar{\Omega})$ and assume that $\varphi$ is non-constant on $\Omega$. We will show that $g$ is contained in $L_2(\Omega)\{\varphi\}$. Without loss of generality, assume $\|\varphi\|_\infty \leq 1$. For any $\lambda \in D$, write

$$E_\lambda = \{z \in \Omega \mid \varphi(z) = \lambda\};$$

then $V_\lambda(E_\lambda) = 0$. For arbitrary $\varepsilon > 0$, let $U_1, U_2$ be open sets which satisfy $E_\lambda \cup \partial\Omega \subset U_1$, $\overline{U_1} \subset U_2$ and $V_\lambda(U_2 - E_\lambda \cup \partial\Omega) = V_\lambda(U_2) < \varepsilon$. By Corollary 1.2.6 in [6], we see easily that there exists $g_{\lambda\varepsilon} \in C^\infty(\overline{\Omega})$ such that

$$g_{\lambda\varepsilon} |_{\Omega - U_2} = g |_{\Omega - U_2}, \quad g_{\lambda\varepsilon} |_{U_1} = 0, \quad \|g_{\lambda\varepsilon}\|_\infty \leq \|g\|_\infty.$$

Obviously, $\overline{\partial g_{\lambda\varepsilon}}$ is a $(0,1)$-form with $C^\infty$-coefficients and $\text{supp}(\overline{\partial g_{\lambda\varepsilon}}) \subset \Omega$. Let $\Omega_\delta$ be a pseudoconvex domain containing $\overline{\Omega}$ such that $g_{\lambda\varepsilon}$ is well defined on $\Omega_\delta$ (such a $\delta$ exists because $g_{\lambda\varepsilon} \in C^\infty(\overline{\Omega})$). In fact, if $\rho$ is the defining function for $\Omega$, then we may choose $\delta$ sufficiently small so that $\rho_\delta = \rho - \delta$ is the defining function for $\Omega_\delta$. Note $\overline{\partial g_{\lambda\varepsilon}}$ is a $\partial$ close $(0,1)$-form; hence there exists a $C^\infty$-function $h_{\lambda\varepsilon}$ on $\Omega_\delta$ which satisfies

$$\overline{\partial h_{\lambda\varepsilon}} = \frac{\overline{\partial g_{\lambda\varepsilon}}}{\varphi - \lambda}$$

by Lemma 4. Therefore $g_{\lambda\varepsilon} - (\varphi - \lambda)h_{\lambda\varepsilon}$ is a holomorphic function on $\Omega$, and $\overline{\partial h_{\lambda\varepsilon}}$ also has support contained in $\Omega$. This shows that $h_{\lambda\varepsilon}$ is analytic in a neighborhood of $\partial\Omega$.

Now assume $\{\lambda_i\}_{j=1}^m$ is a finite collection of points in $\bar{D}$, $\bar{\varepsilon}_i < \varepsilon$, $\Delta_i$ is the open square with center $\lambda_i$, diameter $\frac{\varepsilon_i}{\|h_{\lambda_i\varepsilon}\|_\infty}$ which satisfies $\bigcup_{i=1}^m \Delta_i \supset D$. Set $\varepsilon_i = \frac{\varepsilon_i}{\|h_{\lambda_i\varepsilon}\|_\infty}$, and take a partition of unity $\{P_j(x, y)\}_{j=1}^m(z = x + iy)$ on $\bar{D}$ such that $\text{supp} P_j \subset \Delta_j$. Since $\varphi \in H^\infty(\Omega)$, clearly, $Re\varphi = \frac{z + \bar{\varphi}}{2}, Im\varphi = \frac{\varphi - \bar{\varphi}}{2i}$ are in $H^\infty[\varphi]$. Define

$$f(z) = \sum_{j=1}^m [g_{\lambda_j\varepsilon}(z) - h_{\lambda_j\varepsilon}(z)(\varphi(z) - \lambda_j)]P_j(Re\varphi(z), Im\varphi(z)).$$

We see that $f \in H^\infty(\Omega)[\varphi]$ and

$$|g(z) - f(z)| \leq \sum_{j=1}^m |g(z) - g_{\lambda_j\varepsilon}(z)| |. | P_j(Re\varphi(z), Im\varphi(z))| + \sum_{j=1}^m |h_{\lambda_j\varepsilon}(z)| |. | \varphi(z) - \lambda_j| |. | P_j(Re\varphi(z), Im\varphi(z))|.$$

Since

$$\sum_{j=1}^m |h_{\lambda_j\varepsilon}(z)| |. | \varphi(z) - \lambda_j| |. | P_j(Re\varphi(z), Im\varphi(z))|$$

$$= \sum_{j=1}^m |h_{\lambda_j\varepsilon}(z)| |. | \varphi(z) - \lambda_j| |. | P_j(Re\varphi(z), Im\varphi(z))| |. |\chi_{\{|\varphi(z) - \lambda_j| < \varepsilon_j\}} + \sum_{j=1}^m |h_{\lambda_j\varepsilon}(z)| |. | \varphi(z) - \lambda_j| |. | P_j(Re\varphi(z), Im\varphi(z))| |. |\chi_{\{|\varphi(z) - \lambda_j| \geq \varepsilon_j\}}$$
(where $\chi_E$ denotes the characteristic function of the set $E$), and
\[ P_j(x, y) = 0 \quad \text{for any} \quad (x, y) \notin \Delta_j, \]
we have that
\[
\sum_{j=1}^{m} | h_{\lambda_j \varepsilon}(z) | \cdot | \varphi(z) - \lambda_j | \cdot | P_j(Re \varphi(z), Im \varphi(z)) |
\]
\[
= \sum_{j=1}^{m} | h_{\lambda_j \varepsilon}(z) | \cdot | \varphi(z) - \lambda_j | \cdot | P_j(Re \varphi(z), Im \varphi(z)) | \cdot \chi_{\{|\varphi(z) - \lambda_j| < \varepsilon_j\}}
\]
\[
\leq \sum_{j=1}^{m} \varepsilon | P_j(Re \varphi(z), Im \varphi(z)) | \leq \varepsilon.
\]
On the other hand,
\[
\int_{\Omega} \left( \sum_{j=1}^{m} | g(z) - g_{\lambda_j \varepsilon}(z) | \cdot | P_j(Re \varphi(z), Im \varphi(z)) | \right)^2 dV_n
\]
\[
= \int_{\Omega \cap U_2} \left( \sum_{j=1}^{m} | g(z) - g_{\lambda_j \varepsilon}(z) | \cdot | P_j(Re \varphi(z), Im \varphi(z)) | \right)^2 dV_n.
\]
Note that
\[
\sum_{j=1}^{m} | g(z) - g_{\lambda_j \varepsilon}(z) | \cdot | P_j(Re \varphi(z), Im \varphi(z)) |
\]
\[
\leq \| g - g_{\lambda_j \varepsilon} \|_{\infty} \sum_{j=1}^{m} | P_j(Re \varphi(z), Im \varphi(z)) |
\]
\[
= \| g - g_{\lambda_j \varepsilon} \|_{\infty} \leq 2 \| g \|_{\infty}.
\]
Hence
\[
\int_{\Omega \cap U_2} \left( \sum_{j=1}^{m} | g(z) - g_{\lambda_j \varepsilon}(z) | \cdot | P_j(Re \varphi(z), Im \varphi(z)) | \right)^2 dV_n
\]
\[
\leq 4 \| g \|_{\infty}^2 V_n(U_2 \cap \Omega) < 4 \| g \|_{\infty}^2 \varepsilon,
\]
\[
\int_{\Omega \cap U_2} \left( \sum_{j=1}^{m} | g(z) - g_{\lambda_j \varepsilon}(z) | \cdot | P_j(Re \varphi(z), Im \varphi(z)) | \right) dV_n
\]
\[
\leq 2 \| g \|_{\infty} V_n(U_2 \cap \Omega) < 2 \| g \|_{\infty} \varepsilon.
\]
Further
\[
\int_{\Omega} | g(z) - f(z) |^2 dV_n \leq 4 \| g \|_{\infty}^2 V_n(U_2 \cap \Omega) + 4 \varepsilon \| g \|_{\infty} V_n(U_2 \cap \Omega) + \varepsilon^2
\]
\[
\leq \varepsilon [4 \| g \|_{\infty}^2 + 4 \varepsilon \| g \|_{\infty} + \varepsilon].
\]
This gives that $g \in L^2(\Omega)[\psi]$, to complete the proof.

We are ready to prove our main result.

**Theorem 6.** If $\varphi$ is a non-constant bounded analytic function on $\Omega$, and $\psi$ is a bounded measurable function on $\Omega$ such that $T_{\varphi}$ and $T_{\psi}$ commute, then $\psi$ is analytic.
Proof. Our proof is similar to that in [1]. Suppose \( \varphi \) is a non-constant bounded analytic function on \( \Omega \), and \( \psi \) is a bounded measurable function on \( \Omega \) such that \( T_\varphi T_\psi = T_\psi T_\varphi \). Write \( \psi = f + u \) with \( f \in L^2_\alpha(\Omega) \), and \( u \in L^2(\Omega, dV_n) \ominus L^2_\alpha(\Omega) \). For a non-negative integer \( n \), an easy calculation gives

\[
T_\varphi^n T_\psi 1 = \varphi^n P(f + u) = \varphi^n f
\]

and

\[
T_\psi T_\varphi^n 1 = P(f \varphi^n + u \varphi^n) = f \varphi^n + P(u \varphi^n).
\]

Since \( T_\varphi T_\psi = T_\psi T_\varphi \), by induction, we obtain easily that

\[
T_\varphi^n T_\psi = T_\psi T_\varphi^n.
\]

Thus \( P(u \varphi^n) = 0 \). Consequently, if \( h \in L^2_\alpha(\Omega) \), we have

\[
0 = \langle h, u \varphi^n \rangle = \int_\Omega \bar{u} h \varphi^n dV_n.
\]

Theorem 5 gives that

\[
\int_\Omega \bar{u} g dV_n = 0
\]

for every \( g \in C(\overline{\Omega}) \).

On the other hand, \( C(\overline{\Omega}) \) is dense in \( L^2(\Omega) \). Hence \( u = 0 \). Thus we have that \( \psi = f \), and hence \( \psi \) is analytic, to complete the proof.

Theorem 6 immediately gives the following corollary.

**Corollary 7.** Suppose \( \Omega \) is a pseudoconvex domain, \( \varphi, \psi \in H^\infty \). Then \( T_\varphi T_\psi^* = T_\psi^* T_\varphi \) if and only if either \( \varphi \) or \( \psi \) is constant.
