THE HORN-LI-MERINO FORMULA FOR THE GAP
AND THE SPHERICAL GAP OF UNBOUNDED OPERATORS

G. RAMESH

(Communicated by Marius Junge)

ABSTRACT. In this article we obtain the Horn-Li-Merino formula for computing the gap as well as the spherical gap between two densely defined unbounded closed operators. As a consequence we prove that the gap and the spherical gap of an unbounded closed operator are 1 and \( \sqrt{2} \) respectively. With the help of these formulae we establish a relation between the spherical gap and the gap of unbounded closed operators. We discuss some properties of the spherical gap similar to those of the gap metric.

1. INTRODUCTION

The aim of this article is to deduce the Horn-Li-Merino formula for the gap and the spherical gap between two unbounded closed operators. The gap and the spherical gap are two equivalent metrics on the set of all closed subspaces of a Hilbert space. These allow one to discuss the convergence of subspaces and has applications in Perturbation Theory \([12]\) and in invariant subspaces of finite dimensional operators \([7]\). These concepts can be applied to define a metric on the space of bounded operators between Hilbert spaces and the class of unbounded closed operators between Hilbert spaces via the graph of an operator.

These metrics play an important role in the class of unbounded closed operators, since most of the operators that arise in physical applications are unbounded (see \([12, 21]\) for details). By the closed graph theorem \([22, \text{page 281}]\) an everywhere defined closed operator between Hilbert spaces is bounded. Hence unbounded closed operators are defined on proper subspaces of Hilbert spaces. Because of this fact, the sum and product of unbounded closed operators need not be defined. Hence this class of operators does not form a vector space. Thus one can think of only defining a metric on this class of operators. One of the well known and widely used metrics is the gap metric. This metric was defined by Cordes and Labrousse in \([8]\) to study the properties of unbounded semi-Fredholm operators. A metric which is stronger than the gap metric was introduced by Kaufman in \([13]\) to study the convergence of unbounded operators in Hilbert space. Some relations between the gap metric, the metric defined by Kaufman and the metric induced by the operator...
norm on the space of bounded operators between Hilbert spaces are discussed in [14].

On the space of bounded operators on a Hilbert space, the topology induced by the gap metric and the one induced by the operator norm are the same. Hence the gap metric is a natural generalization of the operator norm. A relation between the operator norm and the gap between two bounded operators on a Hilbert space and applications to Perturbation Theory of operators can be found in [18].

There are two formulae available in the literature for computing the gap between operators, namely the MacIntosh formula and the Horn-Li-Merino formula. A formula for the gap and the spherical gap of an operator on finite dimensional Hilbert space was derived by Habibi in [5, 6].

A more general version of the result for the gap between two \( n \times n \) matrices was proved by MacIntosh, which is now well known as the MacIntosh formula (see [17]). Later this result was extended to bounded operators between Hilbert spaces by Nakamoto in [18]. This formula for the case of unbounded closed operators was obtained by S. H. Kulkarni and G. Ramesh in [15].

The spherical gap formula for matrices was obtained by Horn, Li and Merino in [11], which is well known as the Horn-Li-Merino formula. This formula depends on the minimum modulus (smallest singular value) of a certain matrix which depends on the given matrices. A generalization of this result to the case of bounded operators between Hilbert spaces can be found in [19].

Some relations among the gap and the spherical gap of a bounded operator on Banach spaces were studied by Cvetković in [4].

In this article we obtain the Horn-Li-Merino formula for the gap and the spherical gap between two unbounded closed operators. In fact our results generalizes the results of Nakamoto (see Theorems 3.1 and 3.3). We prove that the gap and the spherical gap of an unbounded closed operator are 1 and \( \sqrt{2} \) respectively. Finally by establishing a relation between the gap and the spherical gap of unbounded closed operators, we prove that these two metrics are equivalent and study some properties of the spherical gap metric, which are analogous to those of the gap metric.

We hope our results will be useful in the Perturbation Theory of Linear Operators, results related to invariant subspaces of unbounded closed operators as in the case of finite dimensional operators and in solving operator equations, in particular for studying the stability of the solution of an operator equation involving unbounded operators.

In the second section we set up some notation and briefly state some preliminary results used in the article. In the third section we prove the Horn-Li-Merino formula for the gap and the spherical gap and we study some properties similar to the gap metric. Finally, we illustrate our theorems with examples.

2. Notation and preliminary results

Throughout the article we consider infinite dimensional Hilbert spaces, which will be denoted by \( H, H_1, H_2, \) etc. The inner product and the induced norm are denoted by \( \langle \cdot, \cdot \rangle \) and \( ||\cdot|| \) respectively. If \( A : D(A) \to H_2 \) is a linear operator with domain \( D(A) \subseteq H_1 \), then the graph \( G(A) \) of \( A \) is defined by \( G(A) := \{ (x, Ax) : x \in D(A) \} \subseteq H_1 \times H_2 \). If \( G(A) \) is closed, then \( A \) is called a closed operator. If \( D(A) \) is dense in \( H_1 \), then \( A \) is called a densely defined operator. For a
The quantity

\[ \theta_0(M, N) := \begin{cases} \sup \{ d(x, N) : x \in S_M \} & \text{if } M \neq \{0\}, \\ 0 & \text{else}, \end{cases} \]

where \( d(x, L) \) is the distance from \( x \) to \( M \). The quantity

\[ \theta(M, N) := \max\{\theta_0(M, N), \theta_0(N, M)\} \]

is called the gap between \( M \) and \( N \).

Equivalently, if \( P = P_M, Q = P_N \) are orthogonal projections, then

\[ \theta(M, N) = \|P - Q\| = \max\{\|P(I - Q)\|, \|Q(I - P)\|\} \]

(see [1] page 70 for details).

**Definition 2.2** ([12] pages 197-198). Let \( M \) and \( N \) be closed subspaces of a Hilbert space \( H \). Define

\[ \hat{\theta}_0(M, N) := \begin{cases} \sup \{ d(x, S_N) : x \in S_M \} & \text{if } M \neq \{0\}, N \neq \{0\}, \\ 0 & \text{if } M = \{0\}, \\ 2 & \text{if } M \neq \{0\}, N = \{0\}. \]

The quantity

\[ \hat{\theta}(M, N) := \max\{\hat{\theta}_0(M, N), \hat{\theta}_0(N, M)\} \]

is called the spherical gap between \( M \) and \( N \).

If \( A, B \in C(H_1, H_2) \), then \( G(A) \) and \( G(B) \) are closed subspaces of \( H_1 \times H_2 \). The gap and the spherical gap between \( A \) and \( B \) are defined by \( \theta(A, B) := \theta(G(A), G(B)) \) and \( \hat{\theta}(A, B) := \hat{\theta}(G(A), G(B)) \) respectively. In particular \( \theta(A, 0) \) and \( \hat{\theta}(A, 0) \) are called the gap and the spherical gap of \( A \) respectively.

**Definition 2.3** (Minimum modulus [12] page 231). Let \( A \in C(H_1, H_2) \) be densely defined. Then \( m(A) := \inf \{ \|Ax\| : x \in D(A), \|x\| = 1 \} \) is called the minimum modulus of \( A \).

**Note 2.4.** If \( A \in C(H_1, H_2) \) is densely defined, then \( m(A^*A) = m(A)^2 \).

**Definition 2.5** (Positive square root [23] Theorem 13.31, page 349). Let \( A \in C(H) \) be a positive operator. Then there exists a unique positive operator \( B \) such that \( A = B^2 \). The operator \( B \) is called the positive square root of \( A \) and is denoted by \( B = A^{\frac{1}{2}} \).
Definition 2.6 (Spectrum [23 page 346]). Let \( A \in \mathcal{C}(H) \) be densely defined. The \textit{resolvent} of \( A \) is defined by
\[
\rho(A) := \{ \lambda \in \mathbb{C} : A - \lambda I : D(A) \to H \text{ is bijective and } (A - \lambda I)^{-1} \in \mathcal{B}(H) \},
\]
and the \textit{spectrum} \( \sigma(A) \) is the complement of \( \rho(A) \) in \( \mathbb{C} \).

Proposition 2.7. Let \( A \in \mathcal{C}(H) \) be selfadjoint. Then \( m(A) = \inf \{ |\lambda| : \lambda \in \sigma(A) \} \).

\textit{Proof.} The proof of this goes along similar lines to that of [16 Theorem 3.5]. \( \Box \)

Proposition 2.8 ([23 page 336, Theorem 13.13]). Let \( A \in \mathcal{C}(H_1, H_2) \) be densely defined. Then the operator \( I + A^*A : D(A^*A) \to H_1 \) is bijective and \( \hat{A} \) is bounded.

The following results will be used throughout the article without mentioning.

Lemma 2.9 ([3, 8, 10, 20]). Let \( A \in \mathcal{C}(H_1, H_2) \) be densely defined. Then:

1. \( \hat{A} \in \mathcal{B}(H_1) \), \( \hat{A} \in \mathcal{B}(H_2) \), \( \| \hat{A} \| \leq 1 \) and \( \| \hat{A} \| \leq 1 \).
2. \( A\hat{A} \subseteq \hat{A}A \), \( \| A\hat{A} \| \leq \frac{1}{2} \) and \( \hat{A}A^* \subseteq A^*\hat{A} \), \( \| A^*\hat{A} \| \leq \frac{1}{2} \).
3. If \( g \in C([0,1]) \), then \( g(\hat{A})A^* \subseteq A^*g(\hat{A}) \) and \( g(\hat{A})A \subseteq Ag(\hat{A}) \).

Theorem 2.10 ([15 Theorem 3.5]). Let \( A, B \in \mathcal{C}(H_1, H_2) \) be densely defined. Then the operators \( B\hat{B}^\frac{1}{2}A\hat{A}^\frac{1}{2}, B^\frac{1}{2}A\hat{A}^\frac{1}{2} \) and \( \hat{A}^\frac{1}{2}B\hat{B}^\frac{1}{2} \) are bounded, and
\[
\theta(A, B) = \max \left\{ \| B\hat{B}^\frac{1}{2}A\hat{A}^\frac{1}{2} - B^\frac{1}{2}A\hat{A}^\frac{1}{2} \|, \| A\hat{A}^\frac{1}{2}B\hat{B}^\frac{1}{2} \| \right\}.
\]

3. Main results

In this section we prove the main results. Recall that if \( A : D(A)(\subseteq H_1) \to H_2 \) is densely defined, then \( \hat{A} = (I + A^*A)^{-1} \) and \( \hat{A} = (I + AA^*)^{-1} \).

Theorem 3.1 (The Horn-Li-Merino formula for the spherical gap). Let \( A, B \in \mathcal{C}(H_1, H_2) \) be densely defined. Let \( \Gamma(A, B) = \hat{A}^\frac{1}{2}B\hat{B}^\frac{1}{2} + A^*\hat{A}^\frac{1}{2}B\hat{B}^\frac{1}{2} \). Then \( \Gamma(A, B) \) is bounded, and
\[
\hat{\theta}(A, B) = \sqrt{2} - 2 \min\{m(\Gamma(A, B)), m(\Gamma(B, A))\}.
\]

\textit{Proof.} The operators \( \hat{A}^\frac{1}{2} \) and \( \hat{B}^\frac{1}{2} \) are bounded, and hence \( \hat{A}^\frac{1}{2}\hat{B}^\frac{1}{2} \) is bounded. By Lemma 2.8 \( A^*\hat{A}^\frac{1}{2} \) and \( B\hat{B}^\frac{1}{2} \) are bounded; hence \( A^*\hat{A}^\frac{1}{2}B\hat{B}^\frac{1}{2} \) is bounded. Thus \( \Gamma(A, B) \) is bounded.

By definition,
\[
\hat{\theta}_0(A, B) = \sup_{(x, Ax) \in S_G(A)} \inf_{(y, By) \in S_G(B)} \| (x, Ax) - (y, By) \| = \sup_{(x, Ax) \in S_G(A)} \inf_{(y, By) \in S_G(B)} \left( \| x - y \|^2 + \| Ax - By \|^2 \right).
\]

For \( x \in D(A) \) and \( y \in D(B) \), consider
\[
f(x, y) := \sqrt{\| x - y \|^2 + \| Ax - By \|^2} = \sqrt{\| x \|^2 + \| y \|^2 - 2 \Re \langle x, y \rangle + \| Ax \|^2 + \| By \|^2 - 2 \Re \langle Ax, By \rangle} = \sqrt{\| x \|^2 + \| Ax \|^2 + \| y \|^2 + \| By \|^2 - 2 \Re \langle x, y \rangle + \langle Ax, By \rangle}.
\]
Thus \( \tilde{\theta}_0(A, B) = \sup_{\|x\|^2 + \|Ax\|^2 = 1} \inf_{\|y\|^2 + \|By\|^2 = 1} f(x, y) \).

Since the operators \( \hat{A}^\frac{1}{2} : H_1 \to D(A) \) and \( \hat{B}^\frac{1}{2} : H_1 \to D(B) \) are bijective, there exist \( u, v \in H_1 \) such that \( x = \hat{A}^\frac{1}{2} u \) and \( y = \hat{B}^\frac{1}{2} v \). It can be easily verified that

\[
\|x\|^2 + \|Ax\|^2 = \|u\|^2 \quad \text{and} \quad \|y\|^2 + \|By\|^2 = \|v\|^2.
\]

So

\[
f(x, y) = \sqrt{\|u\|^2 + \|v\|^2 - 2\text{Re}\left( \langle \hat{A}^\frac{1}{2} u, \hat{B}^\frac{1}{2} v \rangle + \langle A \hat{A}^\frac{1}{2} u, B \hat{B}^\frac{1}{2} v \rangle \right)}
\]

\[
= \sqrt{\|u\|^2 + \|v\|^2 - 2\text{Re}\left( \langle u, \hat{A}^\frac{1}{2} \hat{B}^\frac{1}{2} v \rangle + \langle u, A^* \hat{A}^\frac{1}{2} B \hat{B}^\frac{1}{2} v \rangle \right)}
\]

\[
= \sqrt{\|u\|^2 + \|v\|^2 - 2\text{Re}\left( \langle u, \Gamma(A, B) v \rangle \right)}
\]

\[
= g(u, v).
\]

Hence \( \tilde{\theta}_0(A, B) = \sup_{u \in H_1, \|u\|=1} \inf_{v \in H_1, \|v\|=1} g(u, v) \).

Using the Cauchy-Schwarz inequality, we get

\[
\inf_{\|v\|=1} g(u, v) = \sqrt{1 + \|u\|^2 - 2\|\Gamma(A, B)^* u\|}.
\]

Taking the supremum over \( u \) such that \( \|u\| = 1 \), we have

\[
\tilde{\theta}_0(A, B) = \sup_{\|u\|=1} \inf_{\|v\|=1} g(u, v) = \sqrt{2 - 2 \inf \|\Gamma(A, B)^* u\|}
\]

It can be easily verified that \( \Gamma(A, B)^* = \Gamma(B, A) \). Hence

\[
\tilde{\theta}_0(A, B) = \sqrt{2 - 2m(\Gamma(B, A))}.
\]

Interchanging the roles of \( A \) and \( B \) we get

\[
\tilde{\theta}_0(B, A) = \sup_{\|v\|=1} \inf_{\|u\|=1} g(u, v) = \sqrt{2 - 2m(\Gamma(A, B))}.
\]

The conclusion follows from the definition of \( \check{\theta}(A, B) \).

\[\square\]

**Remark 3.2.** Theorem [5.1] generalizes the formula given by Horn, Li and Merino for \( m \times n \) matrices (see [11] for details), whereas Nakamoto [19] proved that if \( A, B \in B(H) \), then \( \tilde{\theta}(A, B) = \sqrt{2 - 2 \min \{m(\Gamma(A, B)), m(\Gamma(B, A))\}} \), where \( \Gamma(A, B) := \hat{A}^\frac{1}{2} (I + A^* B) \hat{B}^\frac{1}{2} \). By using the relations in Lemma [2.9] it can be shown that this result and Theorem [5.1] coincide for \( A, B \in B(H) \).

**Theorem 3.3** (The Horn-Li-Merino formula for the gap). Let \( A, B \in C(H_1, H_2) \) be densely defined. Then

\[
\theta(A, B) = \sqrt{1 - \min \{m(\Gamma(A, B))^2, m(\Gamma(B, A))^2\}},
\]

where \( \Gamma(A, B) \) is as in Theorem [5.1].
Proof. Let $P := P_{G(A)}$ and $Q := P_{G(B)}$. Then by [13, Theorem 3.5], we have $\|P(I - Q)\| = \|A\tilde{A}^2 \tilde{B}^2 - \tilde{A}^2 \tilde{B} \tilde{B}\|$. So
\[
\|P(I - Q)\|^2 = \|(A\tilde{A}^2 \tilde{B}^2 - \tilde{A}^2 \tilde{B} \tilde{B})^\ast (A\tilde{A}^2 \tilde{B}^2 - \tilde{A}^2 \tilde{B} \tilde{B})\|
\]
\[
= \|(\tilde{B}^2 A^\ast \tilde{A}^2 - \tilde{B}^2 A^\ast \tilde{A}^2)(A\tilde{A}^2 \tilde{B}^2 - \tilde{A}^2 \tilde{B} \tilde{B})\|
\]
\[
= \|\tilde{B}^2 A^\ast \tilde{A}^2 \tilde{A}^2 \tilde{B}^2 - \tilde{B}^2 A^\ast \tilde{A}^2 \tilde{B} \tilde{B}\|
\]
\[
- \tilde{B}^2 A^\ast \tilde{A}^2 \tilde{A}^2 \tilde{B}^2 + \tilde{B}^2 A^\ast \tilde{A}^2 \tilde{B} \tilde{B}^2\|
\]
\[
= \|\tilde{B}^2 A^\ast \tilde{A}^2 \tilde{B}^2 - \tilde{B}^2 A^\ast \tilde{B} \tilde{B}^2\|.
\]

Let $\hat{\Gamma}(A, B) = \Gamma(A, B)^\ast \Gamma(A, B)^\ast$. It is easy to verify that
\[
\hat{\Gamma}(A, B) = \tilde{A}^2 \tilde{B}^2 + A^\ast B^\ast \tilde{B} \tilde{A}^2 + A^\ast \tilde{A}^2 B \tilde{B} + A^\ast \tilde{A}^2 B \tilde{B} + \tilde{A}^2 \tilde{B} \tilde{A}^2 \tilde{B}.
\]

Note that $I - \hat{\Gamma}(B, A) = I - \tilde{B}^2 A \tilde{B}^2 - \tilde{B}^2 A^\ast \tilde{A} \tilde{B}^2 - B^\ast \tilde{B}^2 A \tilde{B} - B^\ast \tilde{B}^2 A^\ast \tilde{A} \tilde{B}^2$. We claim that $\|P(I - Q)\|^2 = \|I - \hat{\Gamma}(B, A)\|^2$ is enough to show that $\tilde{B}^2 A^\ast \tilde{A} \tilde{B}^2 + B^\ast \tilde{B}^2 \tilde{A} \tilde{B}^2 = I - \tilde{B}^2 A \tilde{B}^2 - B^\ast \tilde{B}^2 AA^\ast \tilde{A} \tilde{B}^2$.

Consider
\[
I - \tilde{B}^2 A^\ast \tilde{A} \tilde{B}^2 - B^\ast \tilde{B}^2 \tilde{A} \tilde{B}^2 = \tilde{B}^2 A \tilde{B}^2 - \tilde{B}^2 \tilde{A} \tilde{B}^2 + I - \tilde{B}^2 A^\ast \tilde{A} \tilde{B}^2
\]
\[
- B^\ast \tilde{B}^2 \tilde{A} \tilde{B}^2\]
\[
= \tilde{B}^2 A \tilde{B}^2 + I - \tilde{B}^2 (A^\ast \tilde{A} \tilde{B}^2 + I - \tilde{B}^2 A^\ast \tilde{A} \tilde{B}^2)
\]
\[
- B^\ast \tilde{B}^2 \tilde{A} \tilde{B}^2\]
\[
= \tilde{B}^2 A \tilde{B}^2 + I - \tilde{B}^2 \tilde{A} \tilde{B}^2 - B^\ast \tilde{B}^2 \tilde{A} \tilde{B}^2
\]
\[
= \tilde{B}^2 A \tilde{B}^2 + B^\ast \tilde{B}^2 \tilde{B} \tilde{B}^2 - B^\ast \tilde{B}^2 \tilde{A} \tilde{B}^2
\]
\[
= \tilde{B}^2 A \tilde{B}^2 + B^\ast \tilde{B}^2 (I - \tilde{A} \tilde{B}^2)
\]
\[
= \tilde{B}^2 A \tilde{B}^2 + B^\ast \tilde{B}^2 AA^\ast \tilde{A} \tilde{B}^2.
\]

Thus $\tilde{B}^2 A^\ast \tilde{A} \tilde{B}^2 + B^\ast \tilde{B}^2 \tilde{A} \tilde{B}^2 = I - \tilde{B}^2 A \tilde{B}^2 - B^\ast \tilde{B}^2 AA^\ast \tilde{A} \tilde{B}^2$.

This shows that $I - \hat{\Gamma}(B, A) \geq 0$. As $\|I - \hat{\Gamma}(B, A)\|^2 = \|P(I - Q)\|^2 \leq 1$, it follows that $I - \hat{\Gamma}(B, A) \leq I$ and hence $\hat{\Gamma}(B, A) \geq 0$.

Now
\[
\|P(I - Q)\|^2 = \|I - \hat{\Gamma}(B, A)\|
\]
\[
= \sup \{\|x\| - \|\hat{\Gamma}(B, A)x\| : x \in H_1, \|x\| = 1\}
\]
\[
= 1 - \inf \{\|\hat{\Gamma}(B, A)x\| : x \in H_1, \|x\| = 1\}
\]
\[
= 1 - m(\hat{\Gamma}(B, A))
\]
\[
= 1 - m(\Gamma(B, A))^2.
\]

With a similar computation we can show that $\|Q(I - P)\|^2 = 1 - m(\Gamma(A, B))^2$.

The result now follows from the definition of $\theta_0(A, B)$ and $\theta(A, B)$. 

\[\square\]
Remark 3.4. The formula in Theorem 3.3 improves the formula given by Nakamoto [18, Theorem 4.1]. In fact for $A, B \in \mathcal{B}(H)$, Nakamoto proved that
\[
\theta(A, B) = \sqrt{1 - \min\{m(\tilde{\Gamma}(A, B)), m(\Gamma(B, A))\}},
\]
where
\[
(3.1) \quad \tilde{\Gamma}(A, B) = \tilde{B}^{1/2}(I + B^*A)\tilde{A}(I + A^*B)\tilde{B}^{1/2}.
\]
By the repeated use of relations in Lemma 2.9, it can be shown that $\tilde{\Gamma}(A, B)$ of (3.1) and $\Gamma(A, B)$ considered in Theorem 3.3 are the same.

Theorem 3.5. Let $A, B \in \mathcal{C}(H_1, H_2)$ be densely defined. Then
\[
\tilde{\theta}(A, B) = \sqrt{2\left(1 - \sqrt{1 - \theta(A, B)^2}\right)}.
\]

Proof. Let $c = \min\{m(\Gamma(A, B)), m(\Gamma(B, A))\}$. Then, by Theorem 3.3, $m(\Gamma(A, B)) = \sqrt{1 - \theta^2(A, B)}$. By Theorem 3.1, we have
\[
\tilde{\theta}^2(A, B) = 2(1 - c) = 2\left(1 - \sqrt{1 - \theta^2(A, B)}\right).
\]
Hence $\tilde{\theta}(A, B) = \sqrt{2\left(1 - \sqrt{1 - \theta^2(A, B)}\right)}$. \hfill \Box

Corollary 3.6. Let $A \in \mathcal{C}(H_1, H_2)$ be densely defined. Then $\theta(A) = 1$ and $\tilde{\theta}(A) = \sqrt{2}$.

Proof. By Theorem 3.3, $\theta(A) = \sqrt{1 - \min\{m(\Gamma(A, 0))^2, m(\Gamma(0, A))^2\}}$. Here $\Gamma(A, 0) = A^{1/2} = \Gamma(0, A)$ is self-adjoint. Hence $m(\Gamma(A, 0)) = \inf \{\frac{1}{\lambda + \chi} : \lambda \in \sigma(A^*A)\} = 0$. Here we have used the fact that $\sigma(A^*A)$ is an unbounded since $A^*A$ is unbounded self-adjoint operator. By Theorems 3.1 and 3.3, $\theta(A) = \sqrt{2}$ and $\theta(A) = 1$. \hfill \Box

Corollary 3.7. Let $A, B \in \mathcal{C}(H_1, H_2)$ be densely defined. Then
\begin{enumerate}
\item $\tilde{\theta}(A, B) = \tilde{\theta}(A^*, B^*)$.
\item If $A$ and $B$ are one-to-one, then $\tilde{\theta}(A, B) = \tilde{\theta}(A^{-1}, B^{-1})$.
\end{enumerate}

Proof. This follows from Theorem 3.5 and the corresponding properties of $\theta(\cdot, \cdot)$ (see [12] Theorems 2.18, 2.20, pages 204-205 for details). \hfill \Box

Corollary 3.8. Let $A, B \in \mathcal{C}(H_1, H_2)$ be densely defined. Then
\[
\theta(A, B) \leq \tilde{\theta}(A, B) \leq \sqrt{2} \theta(A, B).
\]

Proof. The inequality $\theta(A, B) \leq \tilde{\theta}(A, B)$ follows from the definitions of $\theta(A, B)$ and $\tilde{\theta}(A, B)$. To prove the other inequality, it is enough to show that $2 \tilde{\theta}^2(A, B) - \tilde{\theta}(A, B) \geq 0$. As $0 \leq \theta(A, B) \leq 1$, it follows that $0 \leq 1 - \theta^2(A, B) \leq 1$. Hence
\[
2 \tilde{\theta}^2(A, B) - \tilde{\theta}(A, B) = 2 \theta^2(A, B) - 2(1 - \sqrt{1 - \theta^2(A, B)})
\]
\[
= 2 \theta^2(A, B) - 2 + 2\sqrt{1 - \theta^2(A, B)}
\]
\[
= 2\left(\sqrt{1 - \theta^2(A, B)} - \sqrt{1 - \theta^2(A, B)}\right)^2
\]
\[
= 2\left(\sqrt{1 - \theta^2(A, B)} - \sqrt{1 - \theta^2(A, B)}\right)^2
\]
\[
\geq 0.
\]
This shows that the second relation is true. \hfill \Box

Corollary 3.9. (1) The set $\{\mathcal{B}(H_1, H_2), \tilde{\theta}(\cdot, \cdot)\}$ is open in $\{(\mathcal{C}(H_1, H_2), \tilde{\theta}(\cdot, \cdot)\}$.  

(2) If $A \in C(H_1, H_2)$ is invertible with $A^{-1} \in B(H_2, H_1)$ and $B \in B(H_1, H_2)$ such that $\bar{\theta}(A, B) < \frac{1}{\sqrt{1 + \|A^{-1}\|^2}}$, then $B$ is invertible and $B^{-1} \in B(H_2, H_1)$. In particular, if $H_1 = H_2 = H$, then $\{A \in C(H) : A^{-1} \in B(H)\}$ is open in $C(H)$ with respect to the spherical gap metric.

Proof. The proof (1) follows by Corollary 3.8 and [2, Proposition 1.6]. The proof (2) follows by Corollary 3.8 and [12, Theorem 2.13, page 203].

**Corollary 3.10.** The set of all bounded self-adjoint operators is a dense subset of the set of all unbounded self-adjoint operators with respect to the spherical gap metric.

Proof. The proof follows from Corollary 3.8 and [2, Proposition 1.6].

**Example 3.11.** Let $H :=$ the real space $L^2[0, \pi]$ of real-valued functions, $H^1 = \{x \in H : x$ is absolutely continuous and $x' \in H\}$ and $H^2 := \{x \in H^1 : x' \in H^1\}$. Let $Lx = dx/dt$, where $D(L) = \{x \in H^1 : x(0) = x(\pi) = 0\}$. Then $L \in C(H)$ and $D(L) = H$. For $n \in \mathbb{N}$, let $\phi_n(t) := \sqrt{\frac{2}{\pi}} \sin(nt)$, $t \in [0, \pi]$ and $\psi_n(t) := \sqrt{\frac{2}{\pi}} \cos(nt)$, $t \in [0, \pi]$. Then $\{\phi_n\}_{n \in \mathbb{N}}$ forms an orthonormal basis for $H$.

It can be shown that $L^* = -d/dt$, $D(L^*) = H^1$ and $L^*L = -d^2/dt^2$, $D(L^*L) = \{x \in H^2 : x(0) = x(\pi) = 0\}$. For $x \in D(L^*L)$ and $y \in H$, we have $x = \sum_{n=1}^{\infty} \langle x, \phi_n \rangle \phi_n$.

Hence

$$Lx = \sum_{n=1}^{\infty} n(x, \phi_n) \psi_n,$$

$$L^*Lx = \sum_{n=1}^{\infty} n^2(x, \phi_n) \phi_n,$$

$$(I + L^*L)x = \sum_{n=1}^{\infty} (1 + n^2) \langle x, \phi_n \rangle \phi_n,$$

$$\hat{L}y = \sum_{n=1}^{\infty} \frac{1}{1 + n^2} \langle y, \phi_n \rangle \phi_n,$$

$$\hat{L}_y = \sum_{n=1}^{\infty} \frac{1}{\sqrt{1 + n^2}} \langle y, \phi_n \rangle \phi_n.$$

We have $m(\Gamma(L, 0)) = m(\hat{L}_y) = \inf \{\frac{1}{\sqrt{1 + n^2}} : n \in \mathbb{N}\} = 0$. Hence by Theorems 3.1 and 3.3, $\bar{\theta}(L) = \sqrt{2}$ and $\theta(L) = 1$.

**Example 3.12.** Let $H = l^2$. Let $D(A) = D(B) = \{(x_j) \in H : \sum_{j=1}^{\infty} j^2 |x_j|^2 < \infty\}$.

Define $A : D(A) \to H$ by $A((x_j)) = (jx_j)$, for all $(x_j) \in D(A)$ and

$$B((x_j)) = \begin{cases} -jx_j & \text{if } j = 2, \\ jx_j & \text{if } j \neq 2. \end{cases}$$
It can be shown that $A$ and $B$ are self-adjoint. For $(y_j) \in H$, we have

$$A(y_j) = \tilde{A}(y_j) = \frac{1}{1 + j^2} y_j = \tilde{B}(y_j) = \hat{B}(y_j),$$

$$\tilde{A}^{\frac{1}{2}}(y_j) = \frac{1}{\sqrt{1 + j^2}} y_j = \hat{B}^{\frac{1}{2}}(y_j),$$

$$A \tilde{A}(y_j) = (\frac{j}{1 + j^2} y_j),$$

$$A \tilde{A}^{\frac{1}{2}}(y_j) = (\frac{j}{\sqrt{1 + j^2}} y_j),$$

$$B \hat{B}(y_j) = \begin{cases} \frac{1}{\sqrt{1 + j^2}} & \text{if } j = 2, \\ \frac{j}{1 + j^2} & \text{if } j \neq 2, \end{cases}$$

$$B \hat{B}^{\frac{1}{2}}(y_j) = \begin{cases} \frac{-j}{\sqrt{1 + j^2}} & \text{if } j = 2, \\ \frac{j}{\sqrt{1 + j^2}} & \text{if } j \neq 2, \end{cases}$$

$$\Gamma(A, B)(y_j) = \begin{cases} -\frac{3}{5} y_j & \text{if } j = 2, \\ y_j & \text{if } j \neq 2. \end{cases}$$

We have $m(\Gamma(A, B)) = \inf \{|\lambda| : \lambda \in \sigma(\Gamma(A, B))\} = \frac{3}{5} = m(\Gamma(B, A))$. Hence by Theorems 3.3 and 3.1, we have $\theta(A, B) = \frac{4}{5}$ and $\tilde{\theta}(A, B) = \frac{2}{\sqrt{5}}$.
