**GRAPH AND DEPTH OF A MONOMIAL SQUAREFREE IDEAL**

DORIN POPESCU

(Communicated by Irena Peeva)

**Abstract.** Let $I$ be a monomial squarefree ideal of a polynomial ring $S$ over a field $K$ such that the sum of every three different ideals of its minimal prime ideals is the maximal ideal of $S$, or more generally a constant ideal. We associate to $I$ a graph on $[s]$, $s = |\text{Min}S/I|$, on which we may read the depth of $I$. In particular, depth$_S I$ does not depend on char $K$. Also we show that $I$ satisfies Stanley’s Conjecture.

**Introduction**

Let $S = K[x_1, \ldots, x_n]$, $n \in \mathbb{N}$, be a polynomial ring over a field $K$, and $I \subset S$ a monomial squarefree ideal with minimal prime ideals $P_1, \ldots, P_s$ (here we study only the monomial squarefree ideals). According to [4] the size of $I$ is the number $v + (n - h) - 1$, where $h$ is the height of $\sum_{j=1}^s P_j$ and $v$ is the minimal number $e$ for which there exist integers $i_1 < i_2 < \cdots < i_e$ such that $\sum_{k=1}^e P_{i_k} = \sum_{j=1}^s P_j$. Similarly, we defined in [8] the bigsize of $I$, which is the number $t + (n - h) - 1$, where $t$ is the minimal number $e$ such that for all integers $i_1 < i_2 < \cdots < i_e$ it follows that $\sum_{k=1}^e P_{i_k} = \sum_{j=1}^s P_j$. Clearly bigsize$(I) \geq$ size$(I)$. Lyubeznik [4] showed that depth $I \geq 1 +$ size $I$.

Let $I \subset S$ be a monomial ideal of $S$, $u \in I$ a monomial and $uK[Z]$, $Z \subset \{x_1, \ldots, x_n\}$ the linear $K$-subspace of $I$ of all elements $uf$, $f \in K[Z]$. A presentation of $I$ as a finite direct sum of such spaces $D : I = \bigoplus_{i=1}^r u_i K[Z_i]$ is called a Stanley decomposition of $I$. Set sdepth$(D) = \min\{|Z_i| : i = 1, \ldots, r\}$ and sdepth $I := \max\{\text{sdepth} (D) : D$ is a Stanley decomposition of $I\}$.

The Stanley Conjecture [11] says that sdepth $I \geq$ depth $I$. This conjecture holds for arbitrary monomial squarefree ideals if $n \leq 5$ by [7] (see especially the arXiv version), or for intersections of four monomial prime ideals by [5], [8]. In the case of nonsquarefree monomial ideals $J$, an important inequality is sdepth $J \leq$ sdepth $\sqrt{J}$ (see [8], Theorem 2.1). Similarly to Lyubeznik’s result, sdepth $I \geq 1 +$ size $I$ by [2], Theorem 3.1. If bigsize$(I) =$ size$(I)$, then $I$ satisfies Stanley’s Conjecture by [2], Theorems 1.2, 3.1.

The purpose of this paper is to study the case when bigsize$(I) = 2$, size$(I) = 1$. In the case $\sum_{j=1}^n P_j = m = (x_1, \ldots, x_n)$, we associate to $I$ a graph $\Gamma$ on $[s]$ given

by \( \{ij\} \) is an edge if and only if \( P_i + P_j = m \). We express the depth of \( I \) in terms of the properties of \( \Gamma \) and of \( q(I) = \min\{\dim \mathcal{S}/(P_i + P_j) : j \neq i, P_i + P_j \neq m\} \). We note that [5] Lemmas 3.2, 3.4 say, in particular, that \( \depth_{\mathcal{S}} I = 2 \) if and only if \( \Gamma \) is a join graph. Our Corollary [2,8] says that if \( q(I) > 1 \), then \( \depth_{\mathcal{S}} I = 2 + q(I) \) if and only if \( \Gamma \) is a so-called concatenation of several graphs on two vertices having no edges. Thus knowing \( q(I) \), \( \depth_{\mathcal{S}} I \) can be read on \( \Gamma \) (see Corollary [2,9]). It follows that for a monomial squarefree ideal \( I \subset \mathcal{S} \) such that the sum of every three different of its minimal prime ideals is a constant ideal (for example \( m \)), \( \depth_{\mathcal{S}} I \) does not depend of \( \text{char } K \) (see Theorem [2,10] and Stanley’s Conjecture holds (see Theorem [3,5]).

It is well known that \( \depth_{\mathcal{S}} I \) depends on the characteristic of \( K \) if \( \text{size}(I) = 5 \), \( \text{size}(I) = 2 \) (see our Remark 2.11), so it is very likely that this case is much harder for proving Stanley’s Conjecture. Several people ask if there exist examples when the special Stanley decomposition of [5], [8] or the splitting variables in the terminology of [4] do not help in proving Stanley’s Conjecture since there exists no good main prime ideal. Our Example 3.3 is such an example.

1. Depth two and three

Let \( \mathcal{S} = K[x_1, \ldots, x_n], n \in \mathbb{N} \) be a polynomial ring over a field \( K \) and \( \tilde{\mathcal{S}} = K[x_1, \ldots, x_{n-1}] \subset \mathcal{S} \). We start by recalling the following two lemmas from [7].

**Lemma 1.1.** Let \( I, J \subset \tilde{\mathcal{S}}, I \subset J, I \neq J \) be two monomial ideals, \( T = (I + x_nJ)\mathcal{S} \) such that

1. \( \depth_{\tilde{\mathcal{S}}} \tilde{\mathcal{S}}/I \neq \depth_{\tilde{\mathcal{S}}} \tilde{\mathcal{S}}/T - 1 \),
2. \( \sdepth_{\tilde{\mathcal{S}}} I \geq \depth_{\tilde{\mathcal{S}}} S/I, \quad \sdepth_{\tilde{\mathcal{S}}} J \geq \depth_{\tilde{\mathcal{S}}} J/I \).

Then \( \sdepth_{\tilde{\mathcal{S}}} T \geq \depth_{\tilde{\mathcal{S}}} T \).

**Lemma 1.2.** Let \( I, J \subset \tilde{\mathcal{S}}, I \subset J, I \neq J \) be two monomial ideals, \( T = (I + x_nJ)\mathcal{S} \) such that

1. \( \depth_{\tilde{\mathcal{S}}} \tilde{\mathcal{S}}/I = \depth_{\tilde{\mathcal{S}}} S/T - 1 \),
2. \( \sdepth_{\tilde{\mathcal{S}}} I \geq \depth_{\tilde{\mathcal{S}}} S/I \),
3. \( \sdepth_{\tilde{\mathcal{S}}} J/I \geq \depth_{\tilde{\mathcal{S}}} J/I \).

Then \( \sdepth_{\tilde{\mathcal{S}}} T \geq \depth_{\tilde{\mathcal{S}}} T \).

The above lemmas allow us to show Stanley’s Conjecture in a special case.

**Proposition 1.3.** Let \( T \subset \mathcal{S} \) be a monomial squarefree ideal. If \( S/T \) is Cohen-Macaulay of dimension 2, then \( \sdepth_{\mathcal{S}} T \geq \depth_{\mathcal{S}} T \).

**Proof.** We use induction on \( n \), the case \( n \leq 5 \) being given in [7]. Suppose \( n > 5 \). Then \( T \) has the form \( T = I + x_nJ \) for two monomial squarefree ideals \( I, J \subset \tilde{\mathcal{S}} \); in fact, \( I = T \cap \tilde{\mathcal{S}}, J = (T : x_n) \cap \tilde{\mathcal{S}} \). Note that \( \dim \tilde{\mathcal{S}}/I = \dim \mathcal{S}/(T, x_n) \leq 2 \) and \( \dim \mathcal{S}/JS = \dim ((x_n) + T)/T \leq 2 \) and so \( \depth_{\tilde{\mathcal{S}}} \tilde{\mathcal{S}}/I \leq 2 \), \( \depth_{\tilde{\mathcal{S}}} \tilde{\mathcal{S}}/J/I \leq 1 \).

If \( \depth_{\tilde{\mathcal{S}}} \tilde{\mathcal{S}}/I = 2 \), then \( \sdepth_{\tilde{\mathcal{S}}} I \geq \depth_{\tilde{\mathcal{S}}} I \) by the induction hypothesis. If \( \depth_{\tilde{\mathcal{S}}} \tilde{\mathcal{S}}/I = 1 \) (by [10], Proposition 1.2 \( \depth_{\tilde{\mathcal{S}}} \tilde{\mathcal{S}}/I > 0 \), then \( \depth_{\tilde{\mathcal{S}}} I = 2 = 1 + \text{size}(I) \leq \sdepth_{\tilde{\mathcal{S}}} I \) by [2, Theorem 3.1] and similarly for \( J \). As \( \dim J/I \leq \dim \tilde{\mathcal{S}}/I \leq \dim \mathcal{S}/T = 2 \) we have \( \sdepth_{\tilde{\mathcal{S}}} J/I \geq \depth_{\tilde{\mathcal{S}}} J/I \) by [6]. Now the result is a consequence of Lemmas 1.1, 1.2 if \( I \neq J \); otherwise \( T = IS \), and we may apply [2] Lemma 3.6. \( \square \)
Let \( I = \bigcap_{i=1}^{s} P_i \), \( s \geq 3 \) be the intersection of the minimal monomial prime ideals of \( S/I \). Assume that \( \sum_{i=1}^{s} P_i = m \) and the bigsize of \( I \) is two. Set
\[
q = q(I) = \min\{\dim S/(P_i + P_j) : j \neq i, P_i + P_j \neq m\}.
\]

We will need the following two lemmas from \[8\].

**Lemma 1.4.** If \( P_1 + P_2 \neq m \) and \( P_k + P_e = m \) for all \( k, e > 2, k \neq e, \) then
- (1) \( \text{depth}_S S/I \in \{1, 2, 1 + q\} \),
- (2) \( \text{depth}_S S/I = 1 \) if and only if there exists \( j > 2 \) such that \( P_1 + P_j = m = P_2 + P_j \),
- (3) \( \text{depth}_S S/I > 2 \) if and only if \( q > 1 \) and each \( j > 2 \) satisfies either
  \[
P_1 + P_j \neq m = P_2 + P_j \quad \text{or} \quad P_2 + P_j \neq m = P_1 + P_j,
\]
- (4) \( \text{depth}_S S/I = 2 \) if and only if the following conditions hold:
  \[
  (a) \quad \text{each } j > 2 \text{ satisfies either } P_1 + P_j \neq m \text{ or } P_2 + P_j \neq m,
  \]
  \[
  (b) \quad q = 1 \text{ or there exists a } k > 2 \text{ such that }
  P_1 + P_k \neq m \neq P_2 + P_k,
\]
- (5) \( \text{sdepth}_S I \geq \text{depth}_S I \).

**Lemma 1.5.** Suppose that whenever there exist \( i \neq j \in [s] \) such that \( P_i + P_j \neq m \), there exist also \( k \neq e \) in \( [s] \setminus \{i, j\} \) such that \( P_k + P_e \neq m \) (that is, the complementary case of the above lemma). Then
- (1) \( \text{depth}_S S/I \in \{1, 2, 1 + q\} \);
- (2) \( \text{depth}_S S/I = 1 \) if and only if after a renumbering of \( \{P_i\} \) there exists \( 1 \leq c < s \) such that \( P_i + P_j = m \) for each \( c < j \leq s \) and \( 1 \leq i \leq c \).

These two lemmas allow us to show the following useful proposition.

**Proposition 1.6.** Suppose that \( P_1 = (x_1, \ldots, x_r), 1 \leq r < n, S' = K[x_{r+1}, \ldots, x_n] \) and \( P_1 + P_2 \neq m \neq P_1 + P_3, P_2 + P_3 \neq m \). Then \( \text{depth}_S S/I \leq 2 \); in particular,
\[
\text{sdepth}_S (P_2 \cap P_3 \cap S') \geq 2 \geq \text{depth}_S S/I.
\]

**Proof.** Apply induction on \( s \); the cases \( s = 3, 4 \) follow from \[5\], \[8\]. Suppose that \( s > 4 \). Set \( E = S/(P_1 \cap P_3 \cap \ldots \cap P_s) \oplus S/(P_1 \cap P_2 \cap P_3 \cap \ldots \cap P_s) \) and \( F = S/(P_1 \cap (P_2 + P_3) \cap P_4 \cap \ldots \cap P_s) \). Note that if \( P_i \subset P_2 + P_3 \) for some \( i \neq 2, 3 \), then \( P_2 + P_3 = P_1 + P_2 + P_3 = m \) because bigsize of \( I \) is two, a contradiction! Thus the bigsize of \( F \) is one and so \( \text{depth}_S S/F = 1 \) by \[8\]. From the exact sequence
\[
0 \to S/I \to E \to F \to 0
\]
we get \( \text{depth}_S S/I = 2 \) if \( \text{depth}_S E > 1 \). Otherwise, suppose that \( G = S/(P_1 \cap P_2 \cap P_3 \cap \ldots \cap P_s) \) has depth one. Then after renumbering \( \{P_i\} \) we may suppose that there exists \( c \neq 3, 1 \leq c < s \), such that \( P_i + P_j = m \) for all \( 1 \leq i \leq c, c < j \leq s, i, j \neq 3 \) (see Lemmas \[14\], \[15\]). In fact we may renumber only \( \{P_e\}_{e>3} \) and take \( c > 3 \) because \( P_1 + P_2 \neq m \). Set \( M = S/P_1 \cap \ldots \cap P_c \) and \( N = M \oplus S/P_3 \cap P_{c+1} \cap \ldots \cap P_s \). In the exact sequence
\[
0 \to S/I \to N \to S/P_3 \to 0
\]
we have the depth of all modules \( \leq \text{depth}_S S/P_3 \). By the Depth Lemma \[12\] it follows that \( \text{depth}_S S/I = \text{depth}_S N \) and so \( \text{depth}_S S/I \leq \text{depth}_S M \). Applying the
induction hypothesis we get depth\(_S\) \(M \leq 2\), that is, depth\(_S\) \(S/I \leq 2\). Finally, by \(9\) we have

\[
\operatorname{sdepth}_{S'}(P_2 \cap P_3 \cap S') \geq \operatorname{sdepth}_{S'}(P_2 \cap P_3 \cap S') = 1 + \operatorname{sdepth}_{S'}(S'/(P_2 \cap P_3 \cap S')) = 1 + \operatorname{depth}_S(S/(P_1 + P_2) \cap (P_1 + P_3) = 2)
\]

because \(P_1 + P_2 + P_3 = m\).

**Corollary 1.7.** Suppose that \(L\) then

\[
\text{Corollary 1.7. Suppose that } \text{bigs}ize(I) = size(I) \leq 2. \text{ Then } \text{depth}_S I \text{ does not depend on the characteristic of } K.
\]

**Proof.** If \(\text{bigs}ize(I) = size(I) = 1\) or \(2\) for \(8\) Corollary 1.7] and so does not depend on the characteristic of \(K\). If \(\text{bigs}ize(I) = size(I) = 2\), then \(\text{depth}_S I \leq 3\) by the above proposition and so \(\text{depth}_S I = 3\) by \(4\) independently of char \(K\) □

**Theorem 1.8.** If \(\text{depth}_S I \leq 3\), then \(\text{sdepth}_S I \geq \text{depth}_S I\).

**Proof.** By \(2\) we have \(\text{sdepth}_S I \geq 1 + \text{size}(I) \geq 2\), and it is enough to consider the case \(\text{depth}_S I = 3\), that is, \(\text{depth}_S S/I = 2\). If dim \(S/I = 2\), then we may apply Proposition 1.3 otherwise we may suppose that dim \(S/P_i \geq 3\) for any \(i\), let us say \(i = 1\). We may suppose that \(P_1 = (x_1, \ldots, x_r)\) for some \(r < n\); thus \(n \geq r + 3\). Set \(S'' = K[x_1, \ldots, x_r], S' = K[x_{r+1}, \ldots, x_n]\).

Applying \(8\) Theorem 1.6] for \(F\) containing some \(\tau_j = \{j\}\), and \(\tau_{jk} = \{j, k\}\), \(1 < j, k \leq s, j \neq k\), we get \(\text{sdepth}_S I \geq \min\{A_0, \{A_{\tau_j}\}_{\tau_j \in F}, \{A_{\tau_{jk}}\}_{\tau_{jk} \in F}\} for \(A_0 = \text{sdepth}_S(I \cap S'')\) if \(I \cap S'' \neq 0\) or \(A_0 = n\) otherwise, and

\[
\text{depth}_S(S/I) = \text{sdepth}_S J_\tau + \text{sdepth}_S(L_\tau),
\]

where \(J_\tau = \bigcap_{e \in J_\tau} P_e \cap S_\tau \neq 0, S_\tau = K[\{x_u : x_u \in S'', x_u \notin \sum_{e \in J_\tau} P_{\tau_e}\}], L_\tau = \bigcap_{e \in J_\tau} (P_e \cap S') \neq 0\). If \(P_1 + P_j \neq m\), then

\[
A_{\tau_j} \geq \text{sdepth}_{S_{\tau_j}} J_{\tau_j} + \text{sdepth}_{S'}(P_j \cap S') \geq 1 + \dim S/(P_1 + P_j) + \left\lceil \frac{\text{height}(P_j \cap S')}{2} \right\rceil,
\]

where \(\lceil a \rceil, a \in \mathbb{Q}\), denotes the smallest integer \(\geq a\). Thus \(A_{\tau_j} \geq 3 = \text{depth}_S I\). If \(P_1 + P_j = m\), then \(P_j \cap S''\) is the maximal ideal of \(S'\) and we have

\[
\text{depth}_S(I \cap S'') \geq 1 + \left\lceil \frac{\text{height}(P_j \cap S')}{2} \right\rceil \geq 1 + \left\lceil \frac{3}{2} \right\rceil \geq 3 = \text{depth}_S I.
\]

If \(P_1 + P_j \neq m \neq P_1 + P_k, P_j + P_k \neq m\), then

\[
A_{\tau_{jk}} \geq \text{sdepth}_{S_{\tau_{jk}}} J_{\tau_{jk}} + \text{sdepth}_{S'} L_{\tau_{jk}} \geq 1 + \text{sdepth}_{S'}(P_j \cap P_k \cap S') = \text{depth}_S I,
\]

by Proposition 1.6 If \(P_1 + P_j = m \neq P_1 + P_k, P_j + P_k \neq m\), then

\[
\text{sdepth}_{S'} L_{\tau_{jk}} \geq \text{depth}_S L_{\tau_{jk}} = 1 + \dim S/(P_1 + P_k) \geq 1 + q.
\]

Thus \(A_{\tau_{jk}} \geq 2 + q \geq 3 = \text{depth}_S I\). If \(P_1 + P_j = m = P_1 + P_k, P_j + P_k \neq m\), then \(L_{\tau_{jk}}\) is the maximal ideal of \(S'\) and we get \(A_{\tau_{jk}} \geq 1 + \left\lceil \frac{3}{2} \right\rceil \geq 3 = \text{depth}_S I\).

If \(I \cap S'' \neq 0\), then \(A_0 = \text{sdepth}_S(I \cap S'')S \geq 1 + n - r \geq \text{depth}_S I\). Hence \(\text{sdepth}_S I \geq \text{depth}_S I\). □
2. Graph of a monomial squarefree ideal

Let \( I = \bigcap_{i=1}^{s} P_i, s \geq 3 \) be the intersection of the minimal monomial prime ideals of \( S/I \). Assume that \( \sum_{i=1}^{s} P_i = m \) and the bigsize of \( I \) is two. We may suppose that \( P_i = (x_1, \ldots, x_r) \) for some \( r < n \) and set

\[
q = q(I) = \min\{\dim S/(P_i + P_j) : j \neq i, P_i + P_j \neq m\}.
\]

Thus \( q \leq n - r \). Set \( S'' = K[x_1, \ldots, x_r], S' = K[x_{r+1}, \ldots, x_n] \).

**Definition 2.1.** Let \( \Gamma \) be the simple graph on \([s]\) given by \( \{ij\} \) is an edge (we write \( \{ij\} \in E(\Gamma) \)) if and only if \( P_i + P_j = m \). We call \( \Gamma \) the graph associated to \( I \). \( \Gamma \) has the triangle property if there exists \( i \in [s] \) such that for all \( j, k \in [s] \) with \( \{ij\}, \{ik\} \in E(\Gamma) \) it follows that \( \{jk\} \in E(\Gamma) \). In fact the triangle property says that it is possible to find a “good” prime in the terminology of \([8]\) Example 4.3, which we recall next.

**Example 2.2.** Let \( n = 10 \), \( P_1 = (x_1, \ldots, x_7) \), \( P_2 = (x_3, \ldots, x_8) \), \( P_3 = (x_1, \ldots, x_4, x_8, \ldots, x_{10}) \), \( P_4 = (x_1, x_2, x_5, x_8, x_9, x_{10}) \), \( P_5 = (x_5, \ldots, x_{10}) \) and \( I = \bigcap_{i=1}^{5} P_i \). Then \( q(I) = 2 \) and \( \text{depth}_S I = 4 \). The graph associated to \( I \) on \([5]\) as above has edges

\[
E(\Gamma) = \{\{13\}, \{15\}, \{35\}, \{14\}, \{23\}, \{24\}\}
\]

and has the triangle property, but only \( \{5\} \) is a “good” vertex; that is, for all \( j, k \in [4] \) with \( \{j5\}, \{k5\} \in E(\Gamma) \) it follows that \( \{jk\} \in E(\Gamma) \). Below you have the picture of \( \Gamma \):

```
        4 ------ 1
          |
          |
        2 ---- 3
          |
          5
```

**Proposition 2.3.** If the bigsize of \( I \) is two and \( \Gamma = \Gamma(I) \) has the triangle property, then \( \text{sdepth}_S I \geq \text{depth}_S I \).

**Proof.** Renumbering \( \{P_i\} \) we may suppose that \( i = 1 \); that is, for all \( j, k \in [s] \) with \( \{1j\}, \{1k\} \in E(\Gamma) \) it follows that \( \{jk\} \in E(\Gamma) \) by the triangle property. We repeat mostly the proof of Proposition 1.8. Applying \([8]\) Theorem 1.6 for \( F \) containing some \( \tau_j = \{j\} \), and \( \tau_{jk} = \{j, k\}, 1 < j, k \leq s, j \neq k \) we get \( \text{sdepth}_S I \geq \min\{A_0, \{A_{\tau_j}\}_{\tau_j \in \mathcal{F}}, \{A_{\tau_{jk}}\}_{\tau_{jk} \in \mathcal{F}}\} \). Note that the bigsize of \( J_\tau \) is \( \leq 1 \) (similarly \( L_\tau \), \( \tau \in \mathcal{F} \) and so \( \text{sdepth}_S J_\tau \geq \text{depth}_S J_\tau \) by \([8]\) Corollary 1.7). If \( P_1 + P_j \neq m \), then

\[
A_{\tau_j} \geq \text{sdepth}_S J_{\tau_j} + \text{sdepth}_S (P_j \cap S') \geq 1 + \dim S/(P_1 + P_j) + \left\lceil \frac{\text{height}(P_j \cap S')}{2} \right\rceil.
\]

Thus \( A_{\tau_j} \geq 2 + q \geq \text{depth}_S I \) by Lemmas 1.3, 1.5. If \( P_1 + P_j = m \) but there exists \( e \neq j \) such that \( P_e + P_j \neq m \), then \( \text{sdepth}_S J_{\tau_j} \geq \text{depth}_S J_{\tau_j} = 1 + \text{depth}_S S/(\bigcap_{e \neq j}(P_e + P_j)) \geq 1 + q \), and so again \( A_{\tau_j} \geq 2 + q \geq \text{depth}_S I \). If \( P_e + P_j = m \) for all \( e \neq j \), then \( \text{depth}_S I = 2 \) by \([8]\) Lemma 1.3 and clearly \( A_{\tau_j} \geq \text{depth}_S I \).
Now note that if \( P_1 + P_j \neq m \neq P_1 + P_k, P_j + P_k \neq m \), then
\[
A_{\tau_{jk}} \geq \text{sdepth}_{S_{\tau_{jk}}} J_{\tau_{jk}} + \text{sdepth}_{S'} L_{\tau_{jk}} \geq 1 + \text{sdepth}_{S'} (P_j \cap P_k \cap S') \geq \text{depth}_S I
\]
by Proposition 2.6. If \( P_1 + P_j = m, P_j + P_k \neq m \), then \( P_j + P_k \neq m \) by the triangle property and \( \text{sdepth}_{S'} L_{\tau_{jk}} \geq \text{depth}_{S'} L_{\tau_{jk}} = 1 + \dim S(P_1 + P_k) \geq 1 + q \). Thus \( A_{\tau_{jk}} \geq 2 + q \geq \text{depth}_S I \). If \( I \cap S'' \neq 0 \), then as in the proof of Proposition 1.8, \( A_0 \geq \text{depth}_S I \). Hence \( \text{sdepth}_S I \geq \text{depth}_S I \). □

**Definition 2.4.** The graph \( \Gamma \) is a join graph if it is a join of two of its subgraphs; that is, after a renumbering of the vertices there exists \( 1 \leq c < s \) such that \( \{ij\} \in E(\Gamma) \) for all \( 1 \leq i \leq c, c < j \leq s \). Thus in Lemmas 1.4, 1.5 one may say that depth_{S/I} S/I = 1 if and only if the associated graph of \( I \) is a join graph. Let \( \Gamma_1, \Gamma_2 \) be graphs on \( \{r\} \), respectively \( \{r, r+1, \ldots, s\} \), for some integers \( 1 < r \leq s-2 \). Let \( \Gamma \) be the graph on \( \{s\} \) given by \( E(\Gamma) = E(\Gamma_1) \cup E(\Gamma_2) \cup \{ij\} : 1 \leq i < r, r < j \leq s \). We call \( \Gamma \) the given graph by concatenation of \( \Gamma_1, \Gamma_2 \) in the vertex \( \{r\} \).

**Lemma 2.5.** Let \( I = \bigcap_{i=1}^{r} P_i \) be the intersection of the minimal monomial prime ideals of \( S/I \), \( I_1 = \bigcap_{i=1}^{r} P_i, I_2 = \bigcap_{i=r+1}^{s} P_i \) and \( \Gamma, \Gamma_1, \Gamma_2 \) be the graphs associated to \( I \), respectively \( I_1, I_2 \) as in the previous section. Suppose that \( \sum_{i=1}^{s} P_i = m, \Gamma \) is the concatenation of \( \Gamma_1, \Gamma_2 \) in \( \{r\} \) and \( \text{bigs}(I) = 2 \). Then
\[
\text{depth}_{S/I} = \min \{\text{depth}_{S/I_1}, \text{depth}_{S/I_2}\}
\]

**Proof.** We consider the following exact sequence:
\[
0 \rightarrow S/I \rightarrow S/I_1 \oplus S/I_2 \rightarrow S/I_1 + I_2 \rightarrow 0.
\]
Since \( P_i + P_j = m \) for all \( 1 \leq i < r, r < j \leq s \), we get \( I_1 + I_2 = P_r \). But \( \text{depth}_{S/I}, \text{depth}_{S/I_1} \leq \text{depth}_{S/P_r} \) for \( i = 1, 2 \) and by the Depth Lemma 12 we get
\[
\text{depth}_{S/I} = \min \{\text{depth}_{S/I_1}, \text{depth}_{S/I_2}\}.
\]

**Remark 2.6.** Let \( I = \bigcap_{i=1}^{3} P_i \) be the intersection of the minimal monomial prime ideals of \( S/I \). Suppose that \( P_1 + P_2 \neq m \neq P_1 + P_3 \) and \( P_2 + P_3 = m \). Let \( I_1 = P_1 \cap P_2, I_2 = P_1 \cap P_3 \) and \( \Gamma, \Gamma_1, \Gamma_2 \) be the graphs associated to \( I \), respectively \( I_1, I_2 \). We have \( E(\Gamma_1) = E(\Gamma_2) = \emptyset \) and \( E(\Gamma) = \{\{23\}\} \). Then \( \Gamma \) is the concatenation of \( \Gamma_1, \Gamma_2 \) in \( \{1\} \) and
\[
\text{depth}_{S/I} = \min \{\text{depth}_{S/I_1}, \text{depth}_{S/I_2}\} = 2 + \min \{\dim S/(P_1 + P_2), \dim S/(P_1 + P_3)\}.
\]

by the above lemma. That is the formula found in [5] Proposition 2.1].

**Proposition 2.7.** Let \( I = \bigcap_{i=1}^{s} P_i \) be the intersection of the minimal monomial prime ideals of \( S/I \) and \( \Gamma \) be the graph associated to \( I \). Suppose that \( \sum_{i=1}^{s} P_i = m, \text{bigs}(I) = 2 \) and \( \text{depth}_{S/I} > 3 \). Then after renumbering \( \{P_i\} \) there exists \( 1 < r \leq s-2 \) such that \( \Gamma \) is the concatenation in \( \{r\} \) of the graphs \( \Gamma_1, \Gamma_2 \) associated to \( I = \bigcap_{i=1}^{r} P_i \), respectively \( I_2 = \bigcap_{i=r+1}^{s} P_i \). Moreover, \( \text{depth}_{S/I_1}, \text{depth}_{S/I_2} > 3 \).

**Proof.** Since \( \text{bigs}(I) = 2 \) we may suppose that \( P_{s-1} + P_s \neq m \), that is, \( \{s-1, s\} \notin \Gamma \). Consider the following exact sequence:
\[
0 \rightarrow S/I \rightarrow S/P_1 \cap \ldots \cap P_{s-1} + S/P_1 \cap \ldots \cap P_{s-2} \cap P_s
\]
Corollary 2.8. Let $I = \bigcap_{i=1}^{s} P_i$ be the intersection of the minimal monomial prime ideals of $S/I$. Suppose that $\sum_{i=1}^{s} P_i = m$, $\text{bigsize}(I) = 2$ and $q(I) > 1$. Then $\text{depth}_S I = 2 + q(I) > 3$ if and only if the graph associated to $I$ is a concatenation of several graphs on two vertices having no edges.

Proof. The necessity follows by applying the above proposition by recurrence and the sufficiency follows by applying Lemma 2.5 by recurrence.

Corollary 2.9. Let $I = \bigcap_{i=1}^{s} P_i$, $I' = \bigcap_{i=1}^{s} P_i'$ be the intersection of the minimal monomial prime ideals of $S/I$, respectively $S/I'$. Suppose that $\sum_{i=1}^{s} P_i = m = \sum_{i=1}^{s} P_i'$, $\text{bigsize}(I) = \text{bigsize}(I') = 2$ and $q(I) = q(I')$. If the graphs associated to $I$, respectively $I'$, coincide, then $\text{depth}_S I = \text{depth}_S I'$.

Proof. By the above corollary, $\text{depth}_S I > 3$ and $\text{depth}_S I' > 3$ hold if and only if the graphs $\Gamma(I), \Gamma(I')$ are concatenations of several graphs on two vertices having no edges. Since $\Gamma(I) = \Gamma(I')$ we get that $\text{depth}_S I > 3$ if and only if $\text{depth}_S I' > 3$. But Lemmas 1.4, 1.5 say that in this case $\text{depth}_S I = 2 + q(I) = 2 + q(I') = \text{depth}_S I'$. Note that $\text{depth}_S I = 2$ holds if and only if $\Gamma(I) = \Gamma(I')$ is a join graph which happens if and only if $\text{depth}_S I' = 2$. Then necessarily $\text{depth}_S I = \text{depth}_S I'$ also in the remaining case $\text{depth}_S I = 3$.

Theorem 2.10. Let the depth of a monomial squarefree ideal $I$ of $S$ be such that the sum of every three different ideals of its minimal prime ideals is the maximal ideal of $S$, or more generally a constant ideal of $S$. Then the depth of $I$ does not depend on the characteristic of $K$.

Proof. It is enough to suppose that $\sum_{i=1}^{s} P_i = m$ and $\text{bigsize}(I) = 2$, $\text{size}(I) = 1$ by Corollary 1.7. By Lemmas 1.4, 1.5 (see also Remark 2.4), $\text{depth}_S I = 2$ if and only if the graph $\Gamma(I)$ associated to $I$ is a join graph which is a combinatorial characterization and so does not depend on $p = \text{char} K$. By Corollary 2.8 $\text{depth}_S I = 2 + q(I) > 3$ if and only if $q(I) > 1$ and $\Gamma(I)$ is a concatenation of several graphs on two vertices having no edges, the exact value of $\text{depth}_S I$ being given by $q(I)$. Thus again $\text{depth}_S I$ does not depend on $p$. Finally, $\text{depth}_S I = 3$ happens only when we are not in the above cases; that is, it does not depend on $p$.

Remark 2.11. The above theorem fails if just the sum of every six minimal prime ideals of $I$ is the maximal ideal of $S$. The Stanley-Reisner ideal $I$ of the simplicial complex associated to the canonical triangulation of the real projective plane has $\text{bigsize}(I) = 5$, $\text{size}(I) = 2$ and $\text{depth}_S I = 4$ if $\text{char} K \neq 2$; otherwise $\text{depth}_S I = 3$.

3. **Stanley’s Conjecture for Monomial Squarefree Ideals of bigsize 2**

The case when \( \dim_S I > 1 + \text{bigsize}(I) \) is unusually big, and it is hard to check Stanley’s Conjecture in this case. Next we will construct such examples, where Lemma 2.5 and Proposition 2.7 prove to be very useful.

**Example 3.1.** Let \( \Gamma_1 \) be the graph given on \( \{1, 2, 5\} \) by \( E(\Gamma_1) = \{\{15\}\} \) and let \( \Gamma_2 \) be the graph given on \( \{3, 4, 5\} \) by \( E(\Gamma_1) = \{\{35\}\} \). Suppose that \( I_1 = P_1 \cap P_2 \cap P_5 \) and \( I_2 = P_3 \cap P_4 \cap P_5 \) are irredundant intersections of monomial prime ideals of \( S \) with \( q(I_1) > 1, q(I_2) > 1 \), \( \text{bigsize}(I_1) = \text{bigsize}(I_2) = 2 \). Then \( \dim_S I = 2 + \min \{\dim S/P_1 + P_2, \dim S/P_2 + P_3\} \geq 2 + q(I_1) > 3 \) by [5] (see Remark 2.6) if \( q(I_1) > 1 \). Similarly, \( \Gamma_2 \) is the graph associated to \( I_2 \) and \( \dim_S I_2 > 3 \). Let \( \Gamma \) be the concatenation in \( \{5\} \) of \( \Gamma_1 \) and \( \Gamma_2 \). If \( I = I_1 \cap I_2 \) is an irredundant intersection of those 5-prime ideals and \( q(I) > 1 \), \( \text{bigsize}(I) = 2 \), then \( \Gamma \) is the graph associated to \( I \) and \( \dim_S I > 3 \) by Lemma 2.5. This is the graph from Example 2.2.

The above example is not bad because this case can be handled by our Proposition 2.3 that is, there exists a “good” main prime \( P_5 \). Are there ideals \( I \) for which there exists no “good” main prime, that is, for which the graph associated to \( I \) does not have the triangle property? Next we will construct such a bad example. First we will see how its graph should look.

**Example 3.2.** Let \( \Gamma_1 \) be the graph constructed above on [5] and \( \Gamma_2 \) be the graph given on \( \{1, 6\} \) with \( E(\Gamma_2) = \emptyset \). Let \( \Gamma \) be the concatenation in \( \{1\} \) of \( \Gamma_1 \) and \( \Gamma_2 \). Below you have the picture of \( \Gamma \), and clearly it does not satisfy the triangle property. If we show that \( \Gamma \) is the graph associated to a monomial squarefree ideal \( I \) of \( S \) with \( \text{bigsize}(I) = 2 \) and \( q(I) > 1 \), then we will have \( \dim_S I > 3 \) by Lemma 2.5. This is done in the next example.

**Example 3.3.** Let \( n = 12 \), \( P_1 = (x_1, x_4, x_5, x_6, x_9, \ldots, x_{12}) \), \( P_2 = (x_1, x_4, \ldots, x_{10}) \), \( P_3 = (x_1, x_2, x_3, x_7, x_8, \ldots, x_{12}) \), \( P_4 = (x_1, x_2, x_3, x_6, x_7, x_8, x_{11}, x_{12}) \), \( P_5 = (x_1, \ldots, x_8) \), \( P_6 = (x_2, \ldots, x_6, x_9, \ldots, x_{12}) \) and \( I = \bigcap_{i=1}^{6} P_i \). We have \( P_1 + P_4 = P_1 + P_5 = P_1 + P_3 = P_2 + P_3 = P_2 + P_4 = P_2 + P_6 = P_3 + P_5 = P_4 + P_5 = P_5 + P_6 = m \) and \( P_1 + P_2 = m \setminus \{x_2, x_3\} \), \( P_1 + P_6 = m \setminus \{x_7, x_8\} \), \( P_2 + P_5 = m \setminus \{x_{11}, x_{12}\} \), \( P_3 + P_4 = m \setminus \{x_4, x_5\} \), \( P_4 + P_5 = m \setminus \{x_9, x_{10}\} \). Clearly, \( \text{bigsize}(I) = 2 = q(I) \) and the graph \( \Gamma \) associated to \( I \) is the graph constructed in Example 3.2. We have \( \dim_S I = 2 + q(I) = 4 \) by Lemma 2.5. Let \( S' = K[x_2, \ldots, x_{12}] \) and \( P'_i = P_i \cap S' \), \( I' = I \cap S' \). We have \( I' = \bigcap_{i=1}^{5} P'_i \) because \( P'_1 \subset P'_6 \). The graph associated to \( I' \) is in fact \( \Gamma_1 \) from the above example and has
the triangle property. Then by Proposition 2.3 we get \( \text{sdepth}_S, I' \geq \text{depth}_S, I' = 2 + q(I') = 4 \) because \( q(I') = q(I) \). Using the decomposition \( I = I' \oplus x_1(I : x_1) \) as linear spaces we get

\[
\text{sdepth}_S I \geq \min\{\text{sdepth}_S, I', \text{sdepth}_S(I : x_1)\} \geq \min\{4, \text{sdepth}_S P_0\}
= \min\{4, \left\lfloor \frac{9}{2} \right\rfloor + 3\} = 4 = \text{depth}_S I.
\]

This gives us the idea to handle such bad examples in the next proposition.

**Proposition 3.4.** Let \( I = \bigcap_{i=1}^{s} P_i \) be the intersection of the minimal monomial prime ideals of \( S/I \). Suppose that \( \sum_{i=1}^{s} P_i = m, \) \( \text{bigs}(I) = 2 \) and \( \text{depth}_S I > 3 \). Then \( \text{sdepth}_S I \geq \text{depth}_S I \).

**Proof.** Apply induction on \( s \). The cases \( s \leq 4 \) are given in [9], [5], [8]. Assume that \( s > 4 \) and let \( \Gamma \) be the graph of \( I \). By Proposition 2.7 we may suppose after renumbering \((P_i)\) that there exists \( 1 < r \leq s - 2 \) such that \( \Gamma \) is the concatenation in \( \{r\} \) of the graphs \( \Gamma_1, \Gamma_2 \) associated to \( I_1 = \bigcap_{i=1}^{r} P_i \), respectively \( I_2 = \bigcap_{i=r}^{s} P_i \). Note that if \( r = 2 \) or \( s - r = 2 \), then \( \text{depth}_S(I_1) \) could not be 2, but this case has no trouble since we need the bigsize 2 only to apply to Proposition 2.7. From Lemma 2.5 it follows that \( \text{depth}_S I = \min\{\text{depth}_S I_1, \text{depth}_S I_2\} \) and so \( \text{depth}_S I_i > 3 \) for \( i = 1, 2 \). Note that \( P_i \setminus P_j \subset P_i \setminus P_j = m \setminus P_j \) for all \( 1 \leq i < r, r < j \leq s \). After renumbering variables we may suppose that \( \{x_1, \ldots, x_e\}, 1 \leq e < n \), are all variables of \( \bigcup_{i>r}(P_i \setminus P_j) \). As we noticed they are contained in any \( P_i, 1 \leq i < r \). Set \( S' = K[x_{e+1}, \ldots, x_n], P'_i = P_i \cap S', I' = I \cap S' \). Then \( P'_r \subset P'_j \) for all \( r < j \leq s \), and we get \( I' = \bigcap_{i=1}^{r} P'_i \). Moreover, since \( \{x_1, \ldots, x_e\} \) is contained in any \( P_i, 1 \leq i \leq r \) we see that the “relations” between these prime ideals are preserved after intersection with \( S' \) and the graph \( \Gamma' \) of \( I' \) is in fact \( \Gamma_1 \). Moreover, \( q(I') = q(I_1) \) and \( \text{bigs}(I') = \text{bigs}(I_1) \). Then \( \text{depth}_{S'}, I' = \text{depth}_S I_1 \) by Corollary 2.9 the case \( r = 2 \) being trivial. Using the induction hypothesis on \( s \) we get \( \text{sdepth}_{S'}, I' \geq \text{depth}_{S'} I' \). We have the decomposition \( I = I' \oplus ((x_1, \ldots, x_e) \cap I) \) as linear spaces, and it follows that

\[
\text{sdepth}_S I \geq \min\{\text{sdepth}_{S'}, I', \text{sdepth}_S ((x_1, \ldots, x_e) \cap I)\}.
\]

But \( J = (x_1, \ldots, x_e) \cap I = \bigcap_{i\leq r} P'_i \cap (x_1, \ldots, x_e) \) because \( (x_1, \ldots, x_e) \subset P_i \) for \( 1 \leq i \leq r \), and the decomposition is irredundant since if \( (x_1, \ldots, x_e) \subset P_j \), then \( P_r \subset P_j \), which is false. Note that \( q(J) = q(I_2) \) and the graph associated to \( J \) coincides with \( \Gamma_2 \). Again by Corollary 2.9 \( \text{depth}_S J = \text{depth}_S I_2 > 3 \), the case \( r = 2 \) being trivial. Using the induction hypothesis on \( s \) we get \( \text{sdepth}_S J \geq \text{depth}_S J \), and so

\[
\text{sdepth}_S I \geq \min\{\text{sdepth}_{S'}, I', \text{sdepth}_S J\} \geq \min\{\text{depth}_S I_1, \text{depth}_S I_2\} = \text{depth}_S I.
\]

**Theorem 3.5.** Let \( I \) be a monomial squarefree ideal of \( S \) such that the sum of every three different of its minimal prime ideals is the maximal ideal of \( S \), or more generally a constant ideal \( J \) of \( S \). Then \( \text{sdepth}_S I \geq \text{depth}_S I \).

The proof follows from Theorem 1.8 and the above proposition, the reduction to the case \( J = m \) being given by [11, Lemma 3.6].
