ALGEBRAIC THEORY OF MACHINES. I.
PRIME DECOMPOSITION THEOREM FOR
FINITE SEMIGROUPS AND MACHINES

BY
KENNETH KROHN1) AND JOHN RHODES

Introduction. In the following all semigroups are of finite order. One semigroup $S_1$ is said to divide another semigroup $S_2$, written $S_1|S_2$, if $S_1$ is a homomorphic image of a subsemigroup of $S_2$. The semidirect product of $S_2$ by $S_1$, with connecting homomorphism $Y$, is written $S_2 \times_Y S_1$. See Definition 1.6. A semigroup $S$ is called irreducible if for all finite semigroups $S_2$ and $S_1$ and all connecting homomorphisms $Y$, $S|(S_2 \times_Y S_1)$ implies $S|S_2$ or $S|S_1$. It is shown that $S$ is irreducible if and only if either:

(i) $S$ is a nontrivial simple group, in which case $S$ is called a prime; or
(ii) $S$ is one of the four divisors of a certain three element semigroup $U_3$ (see Definition 2.1) in which case $S$ is called a unit.

We remark that an anti-isomorphism of a unit need not be a unit. Thus the theory is not symmetric. The explanation is that semidirect product can be written from the left or from the right.

Let be a collection of finite semigroups. We define $K(\mathcal{S})$ as the closure of $\mathcal{S}$ under the operations of division and semidirect product. See Definition 3.2. Then it is proved that $S \in K(\mathcal{S} \cup \{U_3\})$ if and only if $\text{PRIMES}(S) \subseteq \text{PRIMES}(\mathcal{S})$. Here $\text{PRIMES}(S) = \{P | P \text{ is a nontrivial simple group and } P \text{ divides } S\}$ and $\text{PRIMES}(\mathcal{S}) = \bigcup \{\text{PRIMES}(S) | S \in \mathcal{S}\}$. In particular, $S \in K(\text{PRIMES}(S) \cup \{U_3\})$. A counterexample to the conjecture that $S \in K(\text{IRR}(S))$ justifies the distinction between primes and units as well as the inclusion of $U_3$ in the above formulas.

A novel feature of this paper is the use of functions on free semigroups, i.e. machines, to prove facts about finite semigroups.

These above results are obtained as an immediate corollary of a more general theorem (proved here) which finds application as the basis for a prime decomposition theorem for finite state sequential machines. Further, by applying this theorem together with the powerful solvability criteria of Feit and Thompson and of Burnside, we find that Corollary 4.1 answers in important cases the question "What machines can be constructed by series-parallel from counters, delays and units?" See §4. A heuristic discussion of this paper occurs in [6].

Both authors want to thank Professor Warren Ambrose for his important encouragement in the early days of this work.

1. Elementary properties of machines.

NOTATION 1.1. In this paper $A, B, C, \ldots$ will denote nonempty sets. $\sum A$ denotes the free noncommutative semigroup without identity on the generators $A$. A machine will be any mapping $f: \sum A \rightarrow B$ (5). The natural “extension” $\bar{f}: \sum A \rightarrow \sum B$ is defined by $\bar{f}(a_1, \ldots, a_n) = (f(a_1), \ldots, f(a_1, \ldots, a_n))$. We also write $\bar{f}$ as $(f)^*$.

Let $h: A \rightarrow B$. Then $h$ is the unique extension of $h$ to a homomorphism of $\sum A$ into $\sum B$. Thus $h(a_1, \ldots, a_n) = (h(a_1), \ldots, h(a_n))$.

DEFINITION 1.1. Let $f: \sum A \rightarrow B$ and $g: \sum C \rightarrow D$. Then $f|g$, read $f$ divides $g$, if and only if there exists a homomorphism $H: \sum A \rightarrow \sum C$ and a function $h: D \rightarrow B$ so that $h(\bar{f}) = hgH$.

DEFINITION 1.2. Let $f: \sum A \rightarrow B$. Then $S_f$ is the semigroup given by the congruence $=f$ on $\sum A$. Here $t =_{f} r$ if and only if $f(atb) = f(arb)$ for all $a, \beta \in \sum A$ or $a, \beta$ empty. The equivalence class containing $t$ will be denoted by $[t]_f$. The mapping $j_f: S_f \rightarrow B$ sending $[t]_f$ to $f(t)$ induces the partition $P_f$ on $S_f$ and $(S_f, P_f)$ is termed the normal form of $f$. $\text{NF}(f) = (S_f, P_f)$.

DEFINITION 1.3. Let $(S_1, P_1)$ and $(S_2, P_2)$ be two semigroups with partitions. Then $(S_1, P_1)\mid(S_2, P_2)$, read $(S_1, P_1)$ divides $(S_2, P_2)$, if and only if there exists a subsemigroup $S \subseteq S_2$ and a homomorphism $\phi$ of $S$ onto $S_1$ so that $s = s' (\text{mod } P_2)$ implies $\phi(s) = \phi(s') (\text{mod } P_1)$. $S_1 | S_2$ if and only if $S_1$ is a homomorphic image of a subsemigroup $S \subseteq S_2$.

DEFINITION 1.4. Let $S$ be a semigroup. Then $\text{fs}: \sum (S) \rightarrow S$, read the machine of $S$, is defined by $\text{fs}(s_1, \ldots, s_n) = \prod_{i=1}^{n} s_i$. Let $\mathscr{S}$ be a collection of semigroups. Then $f, = \{fs \in \mathscr{S} \}$.

PROPOSITION 1.1. Let $f: \sum A \rightarrow B$ and $g: \sum C \rightarrow D$. Then

(a) $f|j_f S_f$ and $j_f S_f \mid f$, and

(b) $f|g$ if and only if $\text{NF}(f) \mid \text{NF}(g)$.

Proof. To prove (a) we define $h_f: A \rightarrow S_f$ by $h_f(a) = [a]_f$. Then

\[ f = j_f S_f \, h_f \]

showing $f$ divides $j_f S_f$. Further, we define the homomorphism $H_f: \sum S_f \rightarrow \sum A$ by $H_f(s) = (a_1, \ldots, a_n)$. Here $(a_1, \ldots, a_n)$ is any fixed sequence of $\sum A$ such that $[a_1, \ldots, a_n]_f = s$. Then $j_f S_f = fH_f$ showing $j_f S_f$ divides $f$ and proving (a).

We next show that $f|g$ implies $\text{NF}(f) \mid \text{NF}(g)$. Suppose $h g H = f$ and consider $S_g = \{ [H(t)]_g \subseteq S_g | t \in \sum A \}$. $S_g$ is a subsemigroup of $S_g$ since $H$ is a homomorphism. Then $[H(t)]_g \rightarrow [t]_f$ is a well-defined homomorphism of $S_g$.

---

5) See references [3], [4], [6], and [7], and §4 of this paper for a discussion of machines and automata. See reference [5] for group theory and references [1] and [8] for semigroup theory.
onto $S_f$ satisfying the conditions of Definition 1.3. This last assertion is proved by direct verification.

We now show that $NF(f)|NF(g)$ implies $f|g$. Let $S'_f$ be a subsemigroup of $S_f$ and $\phi$ a homomorphism of $S'_f$ onto $S_f$ satisfying the conditions of Definition 1.3. Now by (a) it is sufficient to show that $j_f S'_f|j_f S'_f$.

Let $j'\phi$ be $j_\phi$ restricted to $S'_f$. And let $H: \sum S_f \rightarrow \sum S'_f$ be a homomorphism such that for each $s \in S_f$, $H(s) = \overline{s}$ with $\overline{\phi(s)} = s$. Also there exists a function $h$ so that $j_f \phi = h j'_\phi$ since $\phi$ carries the partitions as is required in Definition 1.3. Then $j_f S_f = j_f (\phi S'_f H) = h j'_\phi S'_f H$. So $j_f S_f|j'\phi S'_f|j_f S'_f$. This proves (b) and Proposition 1.1.

**Definition 1.5.** Let $f: \sum A \rightarrow B$ and $g: \sum C \rightarrow D$. Then $f \times g$: $\sum (A \times C) \rightarrow B \times D$, called the direct sum of $f$ and $g$, is defined by $f \times g((a_1, c_1), \ldots, (a_n, c_n)) = (f(a_1, \ldots, a_n), g(c_1, \ldots, c_n))$. The direct sum of any finite number of machines is defined in a similar fashion. We introduce the notation $(f_1 \times \cdots \times f_n)^*$ for $\overline{\sum}$ where the $f_i$ for $i = 1, \ldots, n$ are machines and $F = f_1 \times \cdots \times f_n$.

Let $H$ be a homomorphism of $\sum B$ into $\sum C$. Then $gHf$ is termed the composition of $f$ followed by $g$ with connecting homomorphism $H$. We now wish to compute $NF(gHf)$ in terms of $S_g$ and $S_f$, forgetting $H$ so far as is possible. Towards this end we require the following definitions.

**Definition 1.6.** Let $S_1$ and $S_2$ be semigroups and let $Y$ be a homomorphism of $S_1$ into endomorphisms of $S_2$. Then the semigroup $S_2 \times Y S_1$ is the semidirect product of $S_1$ by $S_2$ with connecting homomorphism $Y$. $S_2 \times Y S_1$ has elements $S_2 \times S_1$ and multiplication given by $(s_2, s_1) \cdot (s'_2, s'_1) = (s_2 Y(s_1)(s'_2)), s_1 s'_1$.

**Definition 1.7.** The wreath product of $S_1$ by $S_2$, written $S_2 \wreath S_1$, is $F((S_1)\backslash, S_2 \wreath Y S_1$. Here $(S_1)\backslash$, as throughout this paper, is $S_1$ with a two-sided identity added if $S_1$ has none and otherwise $S_1$. $F((S_1)\backslash, S_2)$ is the semigroup of all functions $l$ of $(S_1)\backslash$ into $S_2$ under pointwise multiplication. Also $Y(s_1)(l)(s'_1) = l(s'_1) s_1$. Thus in $S_2 \wreath S_1$, $(l_1, s_1) \cdot (l'_1, s'_1) = (l, s_1 s'_1)$ with $l(x) = l_1(x) l'_1(x)$.

By convention $S_1 w \cdots w S_n = R_n$ is defined inductively by $R_1 = S_1$ and $R_n = R_{n-1} w S_n$. Notice the reversal of indices.

**Proposition 1.2.** There exists a partition $P$ so that $NF(gHf) \mid (S_g w S_f, P)$. In particular $S_g H|S_g \wreath S_f$.

**Proof.** By equation (1.1) we have $gHf = j_f S_f (h_\phi H j_\phi) f_g h_f = j_f S_f (f_g h_f)$ where $i: S_f \rightarrow S_g$ and $i(s) = f_g h_\phi (s)$. Now let $t = (t_1, \ldots, t_n) \subseteq \sum A$ and let $h(t_k) = s_k \in S_f$ for $k = 1, \ldots, n$. Then define $(t^i(t), t^j(t)) \subseteq S_g w S_f$ by $t^i(t) = \prod_{i=1}^n s_k$ and $t^j(t): (S_f)^1 \rightarrow S_g$ with $t^j(t)(s) = i(s_k) j_i(s_1 s_2) \cdots i(s_{i-1} s_n)$. Then $t \rightarrow (t^i(t), t^j(t))$ is a homomorphism of $\sum A$ onto the subsemigroup $I_f$ of $S_g w S_f$. Further $gH(t) = j_f (t^i(t))(1))$. [April]
Now let $P$ be the partition induced on $S_e \times S_f$ by the mapping $(l, s) \rightarrow j_x(l(1))$ and let $F = gHf$. Then it follows that $(t^2, t) \rightarrow [t]_F$ is a well-defined homomorphism of $(I_u, P)$ onto $NF(gHf)$ which preserves the partitions in the sense that $(t^2, t) \equiv (t^2, t') (\mod P)$ if and only if $[t]_F = [t']_F (\mod P_P)$. This proves Proposition 1.2.

2. Statement of the theorem.

Notation 2.1. In the remainder of this paper $A, B, \cdots$ will be finite nonempty sets. $S, T, U, V, \cdots$ with various superscripts and subscripts will denote finite semigroups. $G, H$ and $P$ will denote finite groups. $\mathcal{S}$ will denote a collection of finite semigroups and $\mathcal{F}$ will denote a collection of machines.

The following semigroups and machines will play a special and important role.

Definition 2.1. PRIMES will denote the collection of all nontrivial finite simple groups. $\text{PRIMES}(S) = \{P \in \text{PRIMES} \mid P \text{ divides } S\}$. $\text{PRIMES}(\mathcal{S}) = \bigcup \{\text{PRIMES}(S) \mid S \in \mathcal{S}\}$.

$R_A(L_A)$ denotes the semigroup with elements $A$ and multiplication $a \cdot a' = a'$ ($a' = 1$). $U_3 = (R_{\{r_0, r_1\}})$.

UNITS = $\{S \mid S \text{ divides } U_3\}$. The UNITS are $U_0 = \{1\}$, $U_1 = R_{\{r_0, r_1\}}$, $U_2 = \{r_0\}$ and $U_3$.

The delay machine $D_A: \sum A \rightarrow (A \cup \{\ast\})$ is defined by $D_A(a_1, \cdots, a_n) = a_{n-1}$ for $n \geq 2$ and $D_A(a_1) = \ast$. $D_1$ denotes $D_A$ with $A = \{r_0, r_1\}$ and $\ast = 1$.

We now wish to combine machines by composition and direct sums.

Definition 2.2. $\text{SP}(\mathcal{S})$, read series-parallel closure of $\mathcal{S}$, is defined inductively as follows: $\text{SP}_1(\mathcal{S}) = \mathcal{S}$ and $\text{SP}_{i+1}(\mathcal{S}) = \{f_2 \times f_1, f_2 h f_1, f_2 h | f_1\}$ and $f_2 \in \text{SP}_i(\mathcal{S})$ and $m, n$ and $j$ are functions so $\text{h}$ and $\text{h}$ are length preserving homomorphisms. $\text{SP}(\mathcal{S}) = \bigcup \{\text{SP}_i(\mathcal{S}) \mid i = 1, 2, \cdots\}$.

Remark 2.1. (a) Let $f_{U_1} \in \mathcal{S}$. Then since $\overline{f}_{U_1}$ is the identity map on $\sum_{r_0, r_1}$ it follows that for each finite set $A$ there exists an $f \in \text{SP}(\mathcal{S})$ so that $\overline{f}$ is the identity map on $\sum A$. From this the reader may easily verify that $f_{U_1} \in \mathcal{F}$ implies that $\text{SP}(\mathcal{S})$ equals the set of all machines $g: \sum C \rightarrow D$ such that

\[(2.1)\]

where each $g_i$ is a finite direct sum of members of $\mathcal{S}$ and each $h_i$ for $i = 1, \cdots, n + 1$ is a function. Here $g_i: \sum A_i \rightarrow A_i$ for $i = 1, \cdots, n$ and $h_1: C \rightarrow A_{11}$, $h_2: A_{12} \rightarrow A_{21}$, \cdots, $h_n: A_{n-12} \rightarrow A_{n1}$ and $h_{n+1}: A_{n2} \rightarrow D$. Each $h_i$ for $i = 1, \cdots, n$ is a length preserving homomorphism.

(b) We cannot infer $f_{U_1} \in \text{SP}(\mathcal{S})$ from $f_1 | f_2$ and $f_2 \in \text{SP}(\mathcal{F})$. For example, it can be shown that $D_1$ divides a member of $\text{SP}(\{f_{U_1}\})$ (see equations (3.1)) but does not lie in $\text{SP}(\{f_{U_3}\})$. However, the theorem of this paper implies that $\text{SP}(\mathcal{S} \cup \{f_{U_1}, D_1\})$ is closed under division.
Definition 2.3. Let $S$ have the property that for all $S_1, S_2$ and $Y$, $S \setminus S_2 \times Y S_1$ implies $S \setminus S_2$ or $S \setminus S_1$. Then $S$ is said to be irreducible. IRR denotes the set of all irreducible semigroups.

Theorem. (i) Let $f: \sum A \to B$ be a machine with $S_f$ of finite order. Then $f \in SP(f_{\text{S}} \cup \{ D_1, f_{U_1} \})$ if and only if PRIMES $(S_f) \subseteq$ PRIMES $(S)$. In particular

\[ f \in SP(f_{\text{PRIMES}(S_f)} \cup \{ D_1, f_{U_1} \}) \]

(ii) PRIMES $\cup$ UNITS = IRR.

3. Proof of the theorem. In this section we write $F(A, B)$ for the set of all mappings of $A$ into $B$.

The proof proceeds via several lemmas. First we give a converse to Proposition 1.2.

Lemma 3.1. Let $S_1$ and $S_2$ be semigroups. Then $f_{S_2, S_1} \in SP(\{ f_{S_2}, f_{S_1}, D_1, f_{U_1} \})$.

Proof. One shows by direct computation that $f_{S_2, S_1}$ equals

\[ h_4((b_1) \times \cdots \times (b_n) \times d) h_3(g \times D_{S_f} \times d)^y h_2(g \times f_{S_i}) h_1. \]

Here $S_1 = \{ s_1, \ldots, s_n \}$ and $g = f_R \times \cdots \times f_R$ (taken $n$ times) and $R = R_{F(S_1, S_2)}$. $R \times \cdots \times R$ (taken $n$ times) is $R^n$. Further, $b = f_{S_2}$ and $(b)_i = b$. Also $d = f_{R_1}$ with $R_1 = R_{S_f}$. Here $h_1: S_2 \times S_1 \to R^n \times S_1$ and $h_1(l, s) = (l, \ldots, l, s)$. Further $h_2: R^n \times S_1 \to R^n \times S_1 \times S_1$ and $h_2(l_1, \ldots, l_n, s) = (l_1, \ldots, l_n, s, s)$. Further $h_3: R^n \times (S_1 \cup \{ * \}) \times S_1 \to (S_2)^n \times S_1$ with

\[ h_3(l_1, \ldots, l_n, s, s') = (l_1(s_1), \ldots, l_n(s_n, s), s') \]

and $* = 1$. Finally $h_4: S_2 \times S_1 \to S_2 \times S_1$ and $h_4(k_1, \ldots, k_n, s) = (l, s)$ with $l(s_i) = k_i$.

Now for any finite set $A, R_A$ is a subsemigroup of a suitably large finite direct sum of $U_1$ with itself. Further a restriction of a suitably large finite direct sum of $D_1$ with itself yields $D_A$. Thus the above expression lies in $SP(\{ f_{S_1}, f_{S_2}, D_1, f_{U_1} \})$ and Lemma 3.1 is proved.

Lemma 3.2. PRIMES $\cup$ UNITS $\subseteq$ IRR.

Proof. We first show that PRIMES $\subseteq$ IRR. Let $G' \in$ PRIMES and $G'|S_2 \times Y S_1$. Thus there exists a subsemigroup $S \subseteq S_2 \times Y S_1$ and a homomorphism $\phi$ of $S$ onto $G'$. Let $G$ be a subsemigroup of $S$ of smallest order so that $\phi(G) = G'$. Then $\phi(g \cdot G) = \phi(g) \cdot G'$ and similarly $\phi(G \cdot g) = G'$ for all $g \in G$. Thus $g \cdot G = G \cdot g = G$ for all $g \in G$ and so $G$ is a subgroup of $S_2 \times Y S_1$. Let $p_1(s_2, s_1) = s_1$ and set $p_1(G) = G_1$. Then $p_1$ is a homomorphism and thus $G_1$ is a subgroup of $S_1$. Let $l = (l_2, l_1)$ be the identity of $G$. Set $G_2 = \{ (s_2, l_1) \in G \}$. Then $\psi(s_2, l_1) = Y(l_1)(s_2)$ is a homomorphism of $G_2$ into
$S_2$ and is 1:1 since $\psi(s_2, l_1) = \psi(s'_2, l_1)$ implies

$$(s_2, l_1) = (l_2, l_1)(s_2, l_1) = (l_2(Y(l_1)(s_2)), l_1) = (l_2(Y(l_1)(s'_2)), l_1) = (l_2, l_1)(s'_2, l_1) = (s'_2, l_1).$$

Setting $G_2 = \psi(G_2)$ we have that $G$ is an extension of the subgroup $G_2$ of $S_2$ by the subgroup $G_1$ of $S_1$. Since $G'$ is a homomorphic image of $G$ under $\phi$ and $G'$ is simple, $\neq \{1\}$, it follows that $K$ the kernel of $\phi$ is a maximal normal subgroup of $G$ and that $G'|G_1 \subseteq S_1$ or $G'|G_2 \subseteq S_2$ depending on whether $K \cdot G_2$ equals $K$ or $G$. This proves $\text{PRIMES} \subseteq \text{IRR}$.

We now prove $\text{UNITS} \subseteq \text{IRR}$. We shall prove irreducibility for $U_3$. The proofs for the remaining units are analogous and easier. We first show $U_3|S$ implies $U_3 \subseteq S$. Let $S' \subseteq S$ and let $\phi$ be a homomorphism of $S'$ onto $U_3$. Let $x' \in S'$ and $\phi(x') = 1$. Then some power $e$ of $x'$ is an idempotent and $\phi(e) = 1$. Then $\phi(eS' e) = U_3$ and $e$ is an identity for $eS' e$. Let $S_1$ be a subsemigroup of $eS' e$ of smallest order so that $\phi(S_1) = U_1$. Then for each $s_1 \in S_1$ we have $\phi(s_1 \cdot S_1) = \phi(s_1) \cdot \phi(S_1) = \phi(s_1) \cdot U_1 = U_1$ since $U_1$ is right simple. Thus $s_1 \cdot S_1 = S_1$ for all $s_1 \in S_1$ and so $S_1$ is right simple. Then by a well-known theorem (see [1]) $S_1$ is isomorphic to $G \times R$. $B$ must contain at least two distinct members $b_1$ and $b_2$ since $U_1$ is not a group. Then

$$U_3 \cong \{e, (1, b_1), (1, b_2) \} \subseteq S_1 \subseteq S.$$ 

Suppose now that $U_3 \nsubseteq S_2 \times_y S_1$. By the above $U_3 = \{(b_1, a_1), (b_0, a_0), (b_1, a_1)\} \subseteq S_2 \times_y S_1$. As before, let $p_1$ be the homomorphism $p_1(b, a) = a$. $p_1(U_3) = \{a_1, a_0, a_1\} = S_1$. If $a_0 \neq a_1$, then $p_1(U_3) \subseteq S_1$ is isomorphic to $U_3$ and $U_3|S_1$. This is so because for $i = 0$ or $i = 1$, $a_i = a_i$ implies $a_i = a_i$ which implies $z = a_i$ for all $z \in \{a_i, a_0, a_1\}$. Therefore we may assume that $a_0 = a_1$. Necessarily $b_0 \neq b_1$. Let $p_2: U_3 \to S_2$ with $p_2(b, a) = Y(a_0)(b)$. By examining the nine possibilities and noting that $Y(a_1 \cdot Y(a_0) = Y(a_0) \cdot Y(a_1)$ one easily sees that $p_2$ is a homomorphism. Further, $p_2$ is 1:1 since assuming otherwise leads to $b_0 = b_1$. This follows since $Y(a_0)(b_0) = Y(a_0)(b_1)$ implies $(b_0, a_0) = (b_0, a_0)(b_1, a_0) = (b_0 \cdot (Y(a_0)(b_0)), a_0) = (b_0 \cdot (Y(a_0)(b_0)), a_0) = (b_0, a_0) \cdot (b_0, a_0) = (b_0, a_0)$ so $b_0 = b_1$. Also $Y(a_0)(b_0) = Y(a_0)(b_1)$ implies $(b_0, a_0) = (b_1, a_0)(b_0, a_0) = (b_1(Y(a_0)(b_0)), a_0) = (b_1(Y(a_0)(b_0)), a_0)$ so $b_0 = b_1 \cdot (Y(a_0)(b_1)).$ But $(b_1, a_1)(b_1, a_1) = (b_1 \cdot (Y(a_0)(b_1)), a_0) = (b_1, a_0).$ Thus also $b_1 = b_1(Y(a_0)(b_1))$ which when compared with the above gives $b_0 = b_1$.

Similarly we find $Y(a_0)(b_1) \neq Y(a_0)(b_1)$. Therefore, in this case, $p_2(U_3)$ is isomorphic to $U_3$ and $p_2(U_3) \subseteq S_2$ and so $U_3|S_2$. This completes the proof of lemma 3.2.

We next prove equation (2.2) via Lemmas 3.3—3.8. From equation (2.2) and Lemma 3.2, the entire theorem follows relatively easily.

We prove equation (2.2) by induction on the order of $S_I$. The critical induction step separates into three cases.
Lemma 3.3. Let $S$ be a finite semigroup. Then either:
(i) $S$ is a cyclic semigroup,
(ii) $S$ is left simple so $S = G \times L_A$, or
(iii) There exists a proper left ideal $T \subseteq S$, $T \neq S$, and a proper subsemigroup $V \subseteq S$, $V \neq S$, so that $S = T \cup V$.

Proof. Let $S = \{0\}$. Then (i) holds, so we may assume $S \neq \{0\}$. Let $N$ be a maximal proper two-sided ideal of $S$ and if $S$ has none let $N$ be empty. Let $F = S/N$ (4). As is well known, either $F$ is the two point zero semigroup or $F$ is simple or $F$ is 0-simple.

Assume the first case arises so $F$ is the two point zero semigroup. Then $N$ is not empty. Let $V$ equal the cyclic semigroup generated by $q$ where $S - N = \{x \in S | x \in V\} = \{q\}$ and $T = N$. If $V = S$, then (i) holds. If $V \subset S$, $V \neq S$, then (iii) holds.

Now assume $F$ is either simple or 0-simple. Then either: (1) $F$ has no proper left ideals except possibly zero, or (2) $F$ has a proper left ideal $H$ different from zero.

Let case (1) hold. Then $N$ being empty implies $F$ is left simple which implies by the well known result that (ii) holds. See [1].

If $N$ is not empty and (1) holds, then the theorem of Rees applied to $F$ (see [1] or [8]) implies $S - N$ is a proper subsemigroup of $F$ and hence $S - N$ is a proper subsemigroup of $S$. In this case (iii) holds with $T = N$ and $V = S - N$.

Now assume case (2) holds so $F$ has a proper left ideal $H$ different from zero. Let $V = (F - H) \cup N$ and $T = (H - \{0\}) \cup N$. Then the theorem of Rees applies to $F$ implies $V$ is a proper left ideal of $S$ and $T$ is a proper left ideal of $S$. Now $V \cup T = S$, so (iii) holds in this case.

This completes the proof of Lemma 3.3.

Lemma 3.4. Let $f: \sum A \to B$ and let $S_f$ be left simple. Then equation (2.2) holds for $f$.

Proof. As is well known, $S_f = G \times L_A$, see [1]. From equation (1.1) it is sufficient to show equation (2.2) holds for $f_{S_f}$.

Let $G$ have a normal subgroup $G_1$ and factor group $G_i$ and let $\{g_i | g_i \in G_i\}$ be a set of representatives of the cosets of $G_2$ in $G$. Assume $I = 1$ and let $N$ be the natural homomorphism of $G$ onto $G_1$ with kernel $G_2$. Then, as is well known, $\psi(g) = (f_{g_1}, N(g)) \in G_2 \times G_1$ with $f_{g_1}(g_i) = g_i \cdot g \cdot (r)^{-1}$ where $r = g_1 \cdot N(g)$ is a 1:1 homomorphism of $G$ into $G_2 \times G_1$.

By induction we can obtain the following. Let $G = G_0 \supset G_1 \supset G_2 \cdots \supset G_n = \{1\}$ be a composition series of $G$ with simple factors $H_i = G_{i-1}/G_i$ for

License or copyright restrictions may apply to redistribution; see http://www.ams.org/journal-terms-of-use
$i = 1, \ldots, n$. Then there exists a 1:1 homomorphism $\psi$ of $G$ into $H_n w \cdots w H_1$.

However, PRIMES ($G$) = PRIMES ($\{H_n, \ldots, H_1\}$). Thus utilizing Lemma 3.1 and an obvious induction argument, we see that equation (2.2) holds for $f_0$.

Now let $L = L_{[0,1]}$. Then $f_L$ equals $m_3 f_{\{D_1, f_{U_1}\}} m_2 (D_1 \times f_{U_1})^* m_1$. Here $m_1: \{0,1\} \to U_1 \times U_1$ with $m_1(x) = (r, r_i)$; $m_2: U_3 \times U_1 \to U_3$ with $m_2(1, x) = x$ and $m_2(r_i, x) = 1$; finally $m_3: U_3 \to \{0,1\}$ with $m_3(r_i) = i$ for $i = 0$ or 1 and $m_3(1) = 1$. Thus $f_L \in \text{SP}(\{D_1, f_{U_1}\})$. Now a restriction of a sufficiently large finite direct sum of $f_L$ with itself yields $f_{L'}$. Thus equation (2.2) holds for $f_{L'}$. This completes the proof of Lemma 3.4.

In considering case (iii) of Lemma 3.3 we require the following definitions.

**Definition 3.1.** Let $f: \sum A \to B$ and let $c \in A \cup B$. If $t \in \sum (A \cup \{c\})$ let $t_c$ be that member of $\sum A^1$ given by striking out all members of $t$ occurring before the last $c$ and this last $c$ itself. Then $PPf: \sum (A \cup \{c\}) \to (B \cup \{c\})$, read partial-product $f$, is defined by $PPf(t) = f(t_c)$ with the convention that $f(1)$ equals $c$.

Let $f: \sum A \to B$ and let $e \in A \cup B$. If $t \in \sum (A \cup \{e\})$ let $t_e$ be that member of $\sum A^1$ given by striking out all occurrences of $e$ in $t$. Then

$$ef: \sum (A \cup \{e\}) \to B \cup \{e\}$$

is defined by $ef(t) = f(t_e)$ with the convention that $f(1)$ equals $e$.

Both PP$f$ and $ef$ are extensions of $f$.

**Lemma 3.5.** Let $S, T$ and $V$ be as in (iii) of Lemma 3.3. Then

$$f_S \in \text{SP}(\{f_T, PPf_T, D_1, f_{U_1}\}).$$

**Proof.** By direct computation we verify that $f_S = m_3(ef_T \times f_{R_2}) m_2 (S_A) (f_{R_1} \times PPf_T)^* m_1$. Here $2_A = (D_A \times f_{R_2}) m$ where $m.A \to A \times A$ with $m(a) = (a, a)$. Also $Y = R_1 \times \{e\}$, $R_2 = X = V \cup \{c\}$ and $A = R_1 \times R_2$. Further $m_1: S \to R_1 \times R_2$ with $m_1(s) = (s, c)$ if $s \in T$ and $m_1(s) = (e, s)$ if $s \in S - T = \{x \in S \mid x \notin T\}$. Also $m_2: (A \cup \{e\} \times A \to A$ with $m_2((x_1, y_1), (x_2, y_2)) = (y_1 x_2, y_2)$ if $y_1 \neq c$ and $y_2 = c$ and $m_2((x_1, y_1))(x_2, y_2)) = (x_2, y_2)$ otherwise. Finally $m_3: R_1 \times R_2 \to S$ is defined by $m_3(x_1, y_1) = x_1 y_1$ where $e$ and $c$ are ignored (left out). Notice $(e, c)$ will not occur.

**Lemma 3.6.** Let equation (2.2) hold for $f$. Then PP$f$ and $ef \in \text{SP}(f_{\text{PRIMES} \cup \{D_1, f_{U_1}\}} \cup \{D_1, f_{U_1}\})$.

**Proof.** The proof is given via the following string of statements (a)-(g).

(a) $D_1$ and $f_{U_1}$ in SP($\mathcal{F}$) implies PP$D_1, f_{U_1} \in$ SP($\mathcal{F}$).

**Proof of (a).** PP$D_1$ equals $p(D_1 \times D_1 \times f_{U_1}) m$ where $m: (U_1 \cup \{c\}) \to U_1 \times U_1 \times U_1$ with $m(c) = (r_0, r_1, r_1)$ and $m(r_i) = (r_i, r_0, r_0)$ for $i$ equaling 0 or 1. Also $p: U_3 \times U_3 \times U_3 \to U_3 \cup \{c\}$ with $p(x, y, r_i) = c$ for all $x, y \in U_3$. Further, $p(r_0, r_1, r_0) = 1$, $p(r_0, r_0, r_0) = r_0$ and $p(r_1, r_0, r_0) = r_1$. Finally $p(1, 1, r_1) = 1$ and $p(1, 1, r_1) = c$. Notice $(r_1, r_1, r_0)$ will never occur.
(b) $f_0$ and $f_{U_3}$ in $\text{SP}(\mathcal{F})$ implies $\text{PP}f_0 \subseteq \text{SP}(\mathcal{F})$

Proof of (b). $\text{PP}f_0$ equals $m_3(f_{R_0} \times f_S \times f_{R_{c,1}}) \tilde{m}_2(f_0 \times f_{R_{(0,1)}}) \tilde{m}_1$ with $S = (R_0)^1$. Here $m_1: G \cup \{c\} \rightarrow G \times (G \cup \{c\})$ with $m_1(c) = (1_G, c)$ and $m_1(x) = (x, x)$ for $x \neq c$. Here $1_G$ is the identity of $G$. Further $m_2: G \times (G \cup \{c\}) \rightarrow G \times (G \cup \{1\}) \times \{c, \ast\}$ with $1$ the identity of $S$ and $m_2(g, c) = (g, g, c)$ while $m_2(g, g') = (g, 1, \ast)$. Further, $m_3: G \times (G \cup \{1\}) \times \{c, \ast\} \rightarrow G \cup \{c\}$ where $m_3(a, b, c) = c$ for all $a$ and $b$ and $m_3(a, b, \ast) = b^{-1}a$ for $b \neq 1$ and $m_3(a, b, \ast) = a$ when $b = 1$.

Now since a restriction of a suitably large finite direct sum of $f_{U_3}(f_{U_1})$ with itself yields $f_S(f_{R_{c}})$ the proof of (b) is complete.

(c) Let $U$ be a unit. Then $f_U$ and $f_{U_1}$ in $\text{SP}(\mathcal{F})$ implies $\text{PP}f_U \subseteq \text{SP}(\mathcal{F})$.

Proof of (c). We give the proof only for $U = U_3$. The other cases are easier.

$\text{PP}f_{U_3}$ equals $m_2(f_S \times f_{U_1} \times f_{U_1}) \tilde{m}_1$ with $S = (R_A)^1$ and $A = \{r_0, r_1, r_2\}$. Here $m_1: U_3 \cup \{c\} \rightarrow S \times U_1 \times U_1$ with $m_1(c) = (r_2, r_1, r_1)$ and $m_1(r_i) \rightarrow (r_i, r_0, r_0)$ for $i = 0$ and $1$ and $m_1(1) = (1, r_1, r_0)$. Also $m_2: S \times U_1 \times U_1 \rightarrow U_3 \cup \{c\}$ with $m_2$ being $m_1$ inverse on the image of $m_1$ and $m_2(r_i, r_1, r_0) = r_i$ for $i = 0$ and $1$ and $m_2(r_2, r_1, r_0) = 1$. Otherwise $m_2$ is arbitrary. This proves (c).

(d) Let $\{\text{PP}f | f \in \mathcal{F} \} \subseteq \text{SP}(\mathcal{F})$. Then $f \in \text{SP}(\mathcal{F})$ implies $\text{PP}f \subseteq \text{SP}(\mathcal{F})$.

Proof of (d). By hypothesis $\{\text{PP}f | f \in \text{SP}(\mathcal{F}) \} \subseteq \text{SP}(\mathcal{F})$. Assuming that $\{\text{PP}f | f \in \text{SP}(\mathcal{F}) \} \subseteq \text{SP}(\mathcal{F})$ we will show that $\{\text{PP}f | f \in \text{SP}(\mathcal{F}) \} \subseteq \text{SP}(\mathcal{F})$ which by induction will complete the proof of (d).

Let $f \in \text{SP}(\mathcal{F})$. Then by Definition 2.2 either: (i) $f = f_{U_3} \tilde{m}_1$, (ii) $f = f_1 \times f_2$, or (iii) $f = jf_1h$ with $f_1, f_2 \in \text{SP}(\mathcal{F})$. By assumption, $\text{PP}f_1$ and $\text{PP}f_2$ lie in $\text{SP}(\mathcal{F})$. Thus in case (i) we find $\text{PP}f$ equal to $\text{PP}f_{U_3} \tilde{m}_1(\text{PP}f_1)^*$ where $m_1$ is $m$ extended to $c$ by $m_2(c) = c$. Cases (ii) and (iii) are also handled in the obvious manner and (d) is proved.

(e) Let $S$ equal $(S_D)^1$. Then $f_S \in \text{SP}(\{D_1, f_{U_3}\})$.

Proof of (e). We first see that

\begin{equation}
D_1 = f_{U_3} \tilde{m}(f_{U_3} \times f_{U_1})^* H.
\end{equation}

Here $H: \sum U_3 \rightarrow \sum(U_3 \times U_1)$ and $H$ is a homomorphism with $H(x) = ((1, r_0), (x, r_1))$. Further $m: U_3 \times U_1 \rightarrow U_3$ with $m(y, r_0) = y$ and $m(y, r_1) = 1$ for all $y \in U_3$.

Now by applying Propositions 1.1 and 1.2 to equation (3.1) we find

\begin{equation}
S_{D_1} | U_3 w(U_3 \times U_1) | U_3 w(U_3 \times U_3) = T.
\end{equation}

Further since $T$ is a monoid $(S_D)^1 = S | T$. Now applying Lemma 3.1 to $f_T$ we complete the proof of (e).

(f) Let $f: \sum A \rightarrow B$ and $g: \sum C \rightarrow D$. Then

(i) $g = jf \implies eg = j, efh$, for suitable functions $j$, and $h$.

(ii) Let $S$ be a monoid and let $f_{U_2}$ and $f_S \in \text{SP}(\mathcal{F})$. Then $ef_S \in \text{SP}(\mathcal{F})$. 
(iii) Let $U$ be any unit and $G$ any group. Then $eD_1, ef_U$ and $ef_G$ all lie in $SP(D_1, f_U, f_G)$.

**Proof of (f).** We see that (i) is trivial by taking $j_e$ to be the extension of $j$ to $e$ given by $j_e(e) = e$ and $h_e$ to be the extension of $h$ to $e$ given by $h_e(e) = e$.

To prove (ii) we have that $ef_S$ equals $p(fS \times fS_2)m$ where $m: S \cup \{e\} \to S \times U_2$ with $m(e) = (1, 1)$ and $m(s) = (s, r_0)$. Further, $p: S \times U_2 \to S \cup \{e\}$ with $p(x, 1) = e$ and $p(x, r_0) = x$.

We now prove (iii). The assertions for $ef_G$ and $ef_{U_3}$ follow from (ii). The assertion for $ef_U$ follows from (i) and the assertion for $ef_{U_3}$.

Let $S$ equal $(S_1, e)$ and then, that $ef_S$ lies in $SP(D_1, f_{U_3})$ follows from (e) and (ii) of (f) above. Now the assertion for $eD_1$ follows from equation (1.1) and (i) of (f) above.

This proves (f).

**Proof of (g).** We proceed as in the proof of (d). In case (i) we have $ef = e(f_2 \tilde{m}_2 f_1) = ef_2 \tilde{m}_2 (ef_1 \times f_2) \tilde{m}_1$ with $f_1: \sum A_i \to B_i$ for $i = 1$ and 2 and $R = A_1 \cup \{e\}$. Here $m_1: (A_1 \cup \{e\}) \to (A_1 \cup \{e\}) \times (A_1 \cup \{e\})$ with $m_1(x) = (x, x)$. Also $m_2: (B_1 \cup \{e\}) \times (A_1 \cup \{e\}) \to (A_2 \cup \{e\})$ with $m_2(x, y) = e$ when $y = e$ and $m_2(x, y) = m(x)$ if $y \neq e$. Case (iii) is given by (i) of (f). Case (ii) is handled in the obvious fashion and (g) is proved.

Now (a)-(d) implies the first assertion of Lemma 3.6 and (e)-(g) imply the second assertion. This proves Lemma 3.6.

**Lemma 3.7.** Let $S$ be a cyclic semigroup. Then equation (2.2) holds for $f_S$.

**Proof.** Let $T_n = U_2 \cdot \cdots \cdot U_2$ with $n$ factors. Then $T_n$ contains as a subsemigroup a cyclic semigroup $C(n, 1)$ with index $n$ and period 1. $C(n, 1) = \{q_n, q_2, q_3, \ldots, q_n^{n}\}$ where $q_i \neq q_i^j$ for $1 \leq i \neq j \leq n$ and $q_i^{n+1} = q_i^n$. This is established by induction on $n$. $C(1, 1) = \{0\} \subset U_2$. Now suppose $C(n-1, 1) \cap T_{n-1}$. Let $q_n = (l, 0) \in T_{n-1} w U_2 = T_n$. Here $l: U_2 \to T_{n-1}$ with $l(r_0) = q_{n-1} \in T_{n-1}$ and $l(1) = 1$. Then $q_k^n = (l, 0)^K = (l, 0)$ where $l_K: U_2 \to T_{n-1}$ with $l_K(r_0) = q_{n-1}^K$ and $l_K(1) = q_{n-1}^{K-1}$, Thus $q_n$ generates $C(n, 1) \subset T_n$.

Let $Z_m$ be the additive integers mod $m$. Then $C(n, m) = \{q_m, q^2_m, \ldots, q^n_m\}$ where $q_i \neq q_i^j$ for $1 \leq i \neq j \leq n$ and $q_i^{n+1} = q_i^n$. This is established by induction on $n$. $C(1, 1) = \{0\} \subset U_2$. Now suppose $C(n-1, m) \cap Z_m$. Let $l: U_2 \to Z_m$ with $l(r_0) = q_{n-1} \in T_{n-1}$ and $l(1) = 1$. Then $q_k^n = (l, 0)^K = (l, 0)$ where $l_K: U_2 \to T_{n-1}$ with $l_K(r_0) = q_{n-1}^K$ and $l_K(1) = q_{n-1}^{K-1}$. Thus $q_n$ generates $C(n, 1) \subset T_n$.

**Lemma 3.8.** Equation (2.2) is valid.

**Proof.** By equation (1.1) $f = j_s h_t$. Thus it is sufficient to prove equation (2.2) for $f_S$ where $S$ is a finite semigroup.

We proceed by induction on the order of $S$. The case $|S| = 1$ is trivial. Now assume equation (2.2) holds for all $f_S$ with $|S'| \leq n$. Let $|S| = n + 1$ and apply Lemma 3.3 to $S$. In case (i), Lemma 3.7 applies and we are done.
In case (ii), Lemma 3.4 applies and we are done. In case (iii), Lemma 3.5 and Lemma 3.6 apply and we are done. This proves Lemma 3.8.

To complete the proof of the theorem we require the following definition.

**Definition 3.2.** \( K(\mathcal{S}) \), read the semidirect and divisor closure of \( \mathcal{S} \), is defined inductively as follows: \( K_1(\mathcal{S}) = \mathcal{S} \) and \( K_{i+1}(\mathcal{S}) = \{ S' \mid S' \text{ divides } S \} \) for some \( S \in K_i(\mathcal{S}) \) \( \cup \{ S_2 \times S_1 \mid S_2 \text{ and } S_1 \text{ belong to } K_i(\mathcal{S}) \} \). See Definition 1.6. \( K(\mathcal{S}) = \bigcup \{ K_i(\mathcal{S}) \mid i = 1, 2, \ldots \} \).

**Lemma 3.9.** (a) Let \( S \in \text{IRR} \) and \( S \in K(\mathcal{S}) \). Then \( S \mid S' \) for some \( S' \in \mathcal{S} \).
(b) \( \{ S_i \mid f \in \text{SP}(\mathcal{S}) \} \subseteq K(\{ S_i \mid f \in \mathcal{S} \}) \).

**Proof.** The proof of (a) follows by an obvious induction on \( i \) of \( K_i \) and the definition of irreducible as given in Definition 2.3.

The proof of (b) follows by obvious induction on \( i \) of \( \text{SP}_i \) as the proof of Lemma 3.6(d). In case (i) we use Proposition 1.2. We remark that \( F((S_1)^1, S_2) \) is isomorphic with the direct sum of \( S_2 \) taken \( \mid (S_1)^1 \mid \) times. For (ii) we remark that \( S_{\eta \times S} \). In the case (iii) we use Proposition 1.1. This proves Lemma 3.9.

**Proof of the theorem.** We first prove part (i) of the theorem. Lemma 3.8 proves equation (2.2). Thus

\[
\text{PRIMES}(S) \subseteq \text{PRIMES}(\mathcal{S}) \text{ implies } f \in \text{SP}(\mathcal{S} \cup \{ D_1, f_{U_3} \}).
\]

Now assume \( f \in \text{SP}(\mathcal{S} \cup \{ D_1, f_{U_3} \}) \). Then by Lemma 3.9(b)

\[
S_i \in K(\mathcal{S} \cup \{ U_3, S_{D_3} \}) \subseteq K(\mathcal{S} \cup \{ U_3 \})
\]

with the last inclusion following from equation (3.2). Thus \( P \in \text{PRIMES}(S) \) lies in \( K(\mathcal{S} \cup \{ U_3 \}) \) and thus by Lemmas 3.2 and 3.9(a) \( P \) divides \( S \) for some \( S \in \mathcal{S} \) or \( P \) divides \( U_3 \). \( P \) divides \( U_3 \) is impossible so \( P \) divides \( S \). Thus \( \text{PRIMES}(S) \subseteq \text{PRIMES}(\mathcal{S}) \). Thus proves part (i) of the theorem.

\[
\text{PRIMES} \cup \text{UNITS} \subseteq \text{IRR}
\]

is proved by Lemma 3.2. To prove the opposite inclusion let \( S \in \text{IRR} \). Then by equation (2.2) for \( f \) and (b) and (a) of Lemma 3.9 either \( S \) divides \( P \in \text{PRIMES}(S) \), \( S \) divides \( U_3 \), or \( S \) divides \( S_{D_3} \). In the first case \( S \in \text{PRIMES} \) or \( S = \{ 1 \} \) in which case \( S \) is a unit and in the second case \( S \in \text{UNITS} \). Since by equation (3.2) \( S_{D_3} \subseteq K(\{ U_3 \}) \), we find in the third case that \( S \in K(\{ U_3 \}) \). Thus by Lemma 3.9(a) \( S \) divides \( U_3 \) and \( S \in \text{UNITS} \). This proves the theorem.

**Corollary 3.1.** (a) \( S \in K(\mathcal{S} \cup \{ U_3 \}) \) if and only if \( \text{PRIMES}(S) \subseteq \text{PRIMES}(\mathcal{S}) \),
(b) \( S \in K(\text{PRIMES}(S) \cup \{ U_3 \}) \).

**Proof.** Let \( S(\mathcal{S}) = \{ S_i \mid f \in \text{SP}(\mathcal{S} \cup \{ D_1, f_{U_3} \}) \} \). Now the theorem implies that \( T \in S(\mathcal{S}) \) if \( \text{PRIMES}(T) \subseteq \text{PRIMES}(\mathcal{S}) \). Thus to prove
the corollary it is sufficient to show \( K(\mathcal{S} \cup \{U_3\}) = S(\mathcal{S}) \).

That \( S(\mathcal{S}) \subseteq K(\mathcal{S} \cup \{U_3\}) \) follows from Lemma 3.9(b) and equation (3.2). On the other hand \( T \in K(\mathcal{S} \cup \{U_3\}) \) implies, by the irreducibility of the PRIMES and Lemma 3.9(a), that \( \text{PRIMES}(T) \subseteq \text{PRIMES}(\mathcal{S}) \). Thus \( T \in S(\mathcal{S}) \) and the corollary is proved.

**Remark 3.1.** \( S \in K(\mathcal{S}) \) iff \( \text{IRR}(S) \subseteq \text{IRR}(\mathcal{S}) \) is seen to be false by taking \( S = L_{[0,1]} \).

**Remark 3.2** (a) Let \( W(\mathcal{S}) \) be the closure of \( \mathcal{S} \) under division and wreath product. Then the statement and the proof of Corollary 3.1 holds if \( K \) is replaced throughout by \( W \).

(b) Let \( E(\mathcal{S}) \) be the closure of \( \mathcal{S} \) under division and Schreier extensions adapted to monoids. Thus \( S_1 \) and \( S_2 \in E(\mathcal{S}) \) implies all Schreier extensions of \( S_1 \) by \( S_2 \) lie in \( E(\mathcal{S}) \). Then, again, the statement and the proof of Corollary 3.1 hold if \( K \) is replaced throughout by \( E \). This is so since any extension of \( S_1 \) by \( S_2 \) is a subsemigroup of \( S_1 \wedge S_2 \) and conversely \( S_1 \wedge S_2 \) is a Schreier extension of a finite direct sum of \( S_1 \) by \( S_2 \).

Thus each \( P \in \text{PRIMES} \) is irreducible with respect to \( E \).

**Corollary 3.2.** (a) \( S \mid S_1 \wedge S_2 \wedge \cdots \wedge S_n \) for some sequence \( S_1, \ldots, S_n \) where \( S_i \in \text{PRIMES}(S) \cup \text{UNITS} \).

(b) \( S \mid T \) for some monoid \( T \) which is constructed by successive Schreier extensions adapted to monoids with factors \( S_1, \ldots, S_n \). Here each \( S_i \) may be taken to be \( U_3 \) or a Jordan-Hölder factor of maximal subgroup of \( S \).

**Proof.** Statement (a) follows from Remark 3.2 (a) since one may verify that \( W(\text{PRIMES}(S) \cup \{U_3\}) \) consists of all divisors of \( S_1 \wedge \cdots \wedge S_n \) where \( S_i \in \text{PRIMES}(S) \cup \text{UNITS} \).

To prove (b) we first remark that \( \text{PRIMES}(S) = \text{PRIMES}(\{P|P \text{ is a Jordan-Hölder factor of a maximal subgroup of } S\}) \). This follows from elementary group theory. Also \( T_i \mid S_i \) for \( i = 1, \ldots, n \) implies \( T_1 \wedge \cdots \wedge T_n \mid S_1 \wedge \cdots \wedge S_n \). Thus (b) follows from (a).

### 4. Application to sequential machines.

We first give a quick review of some well-known elementary results on sequential machines. See [3], [4], [6], and [7]. \( M = (A, B, Q, \lambda, \delta) \), with \( A, B \) and \( Q \) finite nonempty sets, \( \lambda: Q \times A \to Q \) and \( \delta: Q \times A \to B \), is called a finite state sequential machine. \( Q \) is the set of states.

For each \( q \in Q, M_q: \sum A \to B \) is defined inductively by \( M_q(a) = \delta(q, a) \) and \( M_q(a_1, \ldots, a_n) = M_{\lambda(q,a)}(a_2, \ldots, a_n) \) for \( n \geq 2 \). \( M \) is said to be reduced if \( q \to M_q \) is 1:1.

Let \( f: \sum A \to B \) and define \( M(f) = (A, B, \{fL_t|t \in (\sum A)^1\}, \lambda, \delta) \). Here \( L \) is the left regular representation so \( L_t: \sum A \to \sum A \) with \( L_t(r) = t \cdot r \). Further, \( \lambda(fL_t, a) = fL_tL_a = fL_{t,a} \) and \( \delta(fL_t, a) = fL_t(a) \). Then \( M(f)_M = fL_t \) and,

\(^{(4)}\) The proof is similar to the group extension case as is given in the proof of Lemma 3.4.
up to isomorphism, $M(f)$ is the unique smallest reduced machine realizing $f$

as some $M_q$.

Let $M = (A, B, Q, \lambda, \delta)$ be a machine. For each $t \in \sum A$ define $\hat{\lambda}(t) : Q \to Q$

inductively as follows: $(\hat{\lambda}(a_1))(q) = \lambda(q, a_1)$ for $a_1 \in A$, and $(\hat{\lambda}(a_1, \ldots, a_n))(q)

= \hat{\lambda}(a_n)[\hat{\lambda}(a_1, \ldots, a_{n-1})(q)]$ for $n \geq 2$.

Let $F_C(Q, Q)$ be a semigroup under the composition $(f \circ g)(q) = g(f(q))$. Then $t \to \hat{\lambda}(t)$ is a homomorphism of $\sum A$ into $F_C(Q, Q)$. Let $Q_q = \{q' \in Q | \hat{\lambda}(t)(q) = q' \text{ or } q' = q\}$. Let $\psi(t) = \hat{\lambda}(t)$ restricted to $Q_q$. Then $\psi$ is a

homomorphism of $\sum A$ into $F_C(Q_q, Q_q)$. We set $\psi(\sum A)$ equal to $S_q$.

Now let $M_q = f$ and assume $M$ is reduced. Then it is easy to verify that

the left regular representation of $S_f$ is isomorphic with $S_q$. In particular the

maximal subgroups of $S_f$ and $S_q$ are isomorphic so

$$\text{PRIMES } (S_f) = \text{PRIMES } (S_q).$$

Let $t \in \sum A$. We say $q_1, \ldots, q_n, q_{n+1} = q_1$ is a $t$-loop of length $n \geq 1$ of $M$ iff $q_i \in Q$ for $i = 1, \ldots, n$ and $q_i \neq q_j$ for $1 \leq i \neq j \leq n$, and $\hat{\lambda}(t)(q_i) = q_{i+1}$

for $i = 1, \ldots, n$.

**Definition 4.1.** Prime loop $(M) = \{p | p$ is a prime integer and there

exists a $t \in \sum A$ so that $M$ has a $t$-loop of length $p\}$. $M \in \text{SP}(G)$ if and only if $M_q \in \text{SP}(G)$ for all $q$.

$Z_p$ denotes the integers under addition mod $p$.

**Corollary 4.1 (Constructability from counters).** Let $M$ be a reduced

finite state sequential machine. Then

I. $M \in \text{SP}(\{f_{U_3}, D_1\})$ if and only if prime loop $(M)$ is empty.

II. $M \in \text{SP}(\{f_{U_3}, D_1, f_{z_p}\})$ for $p$ one fixed prime if and only if prime loop $(M) \subseteq \{p\}$.

III. (Burnside) $M \in \text{SP}(\{f_{U_3}, D_1, f_{z_p}, f_{z_q}\})$ for $p$ and $q$ two fixed primes if and only if prime loop $(M) \subseteq \{p, q\}$.

IV. (Feit, Thompson) $M \in \text{SP}(\{f_{U_3}, D_1\} \cup \{f_{z_p}, p \in \pi\})$ where $\pi$ is a set of odd primes if and only if prime loop $(M) \subseteq \pi$.

**Proof.** By utilizing the well-known fact that a prime $p$ divides the order of $G$ if and only if $G$ has an element of order $p$ and canonical facts concerning mapping representations of $Z_p$, see [5], we find that prime loop $(M)$ is exactly that set of primes which divide the order of some (maximal) subgroup of $S_{M_q}$ for some $q \in Q$.

Now equation (2.2) implies $f \in \text{SP}(\{f_{U_3}, D_1\} \cup \{f_{z_p}, p \in \pi\})$ for a set of primes $\pi$ if and only if the (maximal) subgroups of $S_f$ are solvable and the prime divisors of their orders are among the primes $\pi$. This is so since by elementary group theory the (maximal) subgroups of $S$ are solvable iff $\text{PRIMES } (S) = \{Z_p | p$ divides the order of a (maximal) subgroup of $S$

and $p$ is prime$\}$. 

Now I immediately follows. II follows from the well-known theorem that $p$-groups are solvable. See [5].

III follows from Burnside's theorem of the solvability of groups of order $p^n q^r$. See [5].

Feit and Thompson in [2] have proved solvability of groups of odd order, proving IV and Corollary 4.1.

**Definition 4.2.** Let $\mathcal{F}_k$ be the collection of all $f$: $\sum A \to B$ so that $f = M_q$ for some finite state sequential machine $M$ with $k$ or less states. We remark that $f \in \mathcal{F}_k$ for some $k$ if and only if $S_f$ is finite.

Let $f$: $\sum A \to B$ with $S_f$ of finite order. Then size ($f$) is the smallest integer $k$ so that $f \in \mathcal{F}_k$.

**Corollary 4.2.** Let $g$: $\sum C \to D$ with $S_g$ of finite order and size ($g$) $\geq 2$. Then size ($g$) is the maximum of $\{\text{size} (f_P) | P \in \text{PRIMES} (S_g)\}$ and 2.

**Proof.** Clearly size ($f_{u_2}$) and size ($f_{u_1}$) are both 2. Further it can be shown that size ($f_{u_2}$) = 2 and $D_1 \in \text{SP} (\{f_{u_3}, f_{u_4}\})$. Thus size ($D_1$) = size ($f_{u_1}$) = 2 for all units $U \neq \{1\}$.

Let $s_g$ equal the maximum of $\{\text{size} (f_P) | P \in \text{PRIMES} (S_g)\}$ and 2. Then the above plus equation (2.2) implies size ($g$) $\leq s_g$.

By assumption, size ($g$) $\geq 2$ and trivially $s_g \geq 2$. Thus if $s_g = 2$ we have $s_g = \text{size} (g)$. Suppose $s_g > 2$. Then PRIMES ($S_g$) is nonempty. So let $P \in \text{PRIMES} (S_g)$. We will show if $g$ has any decomposition as in (2.1) with $g_i = f_{i_1} \times \cdots \times f_{i_n}$ then some $g_i$ is such that the number of states of $M(f_{i_j})$ is $\geq \text{size} (f_P)$.

Let $\mathcal{S}_i = \{S_{u_i} | f_{u_i} \text{ occurs as a summand in } g_i \text{ for } i = 1, \ldots, n\}$. Then $P \in K(\mathcal{S}_i)$ since equation (1.1) applied to each $f_{u_i}$ yields $g \in \text{SP}(f_{u_i})$ and thus Lemma 3.9 (b) applies. Thus by Lemma 3.9 (a) and the irreducibility of $P$ we have $P|S_{u_i}$ for some $f_{u_i}$.

Let $m$ be the number of states of $M(f_{u_i})$. We will show size ($f_P$) $\leq m$. From the proof of Lemma 3.2 there exists a subgroup $G$ of $S_{u_i}^m$ so that $P$ is a homomorphic image of $G$. The left regular representation of $S_{u_i}^m$, and hence $G$, is faithfully represented by mappings on $m$ letters. Thus $G$ is faithfully represented by permutations on $m^{(1)} \leq m$ letters by restricting the representation to those $m^{(1)}$ letters fixed by the identity of $G$. Now write $G$ as a subdirect product of its transitive components. See [5]. Now $P$, being irreducible, must divide one of the components and thus $P$ divides a group $G_i$ which has a faithful transitive permutation representation on $m^{(2)} \leq m^{(1)} \leq m$ letters. Now choose $G_i'$ to be a subgroup of $G_i$ which has $P$ as a homomorphic image. Then $G_i'$ has a faithful permutation representation on $m^{(2)}$ letters which is not necessarily transitive. By continuing the above process we finally obtain a group $G^{(1)}$ which has a faithful transitive permutation representation on
\textit{m}^{(3)} \leq m \text{ letters and } P \text{ is a homomorphic image of } G^{(1)}. \text{ Now from the elementary theory of such representations, see [5], we find that } P \text{ itself has a faithful transitive representation on } m^{(4)} \text{ letters with } m^{(4)} \text{ dividing } m^{(3)} \text{ and thus } m^{(4)} \leq m. \text{ The corollary now follows from the following lemma.}

\textbf{Lemma 4.1.} Let \( G \) be a simple group and let \( f: \sum A \rightarrow B \) with \( S = G \). Then \( \text{size}(f) = \text{size}(f_G) = n \). Further, \( n \) equals the smallest number of letters on which \( G \) has a faithful transitive permutation representation.

\textbf{Proof.} Let \( \phi \) be a faithful transitive permutation representation of \( G \) on the smallest number of letters \( L \). Consider the machine \( M = (G, L, L, \phi, \phi) \). Let \( \tilde{f} = f_e \), for some \( e \in L \). Then \( \tilde{f} = jf_G \) and \( S_f = G \) and thus \( \text{size}(f) \) equals the minimum of \( \{ \text{size}(f') | S_{f'} = G \} \), which is the order of \( L \).

Now, by equation (1.1) it is sufficient to prove \( \text{size}(\tilde{f}) = \text{size}(f_G) \). Let \( NF(\tilde{f}) = (G, \tilde{P}) \). Then \( xg_1y = xg_2y \pmod{\tilde{P}} \) for all \( x \) and \( y \) in \( G \) implies \( g_1 = g_2 \). Now for each \((g_1, g_2) \in G \times G\) let \( f_{(g_1, g_2)} = j(f_0L_{g_1})h_{g_2} \). Here \( h_{g_2}: G \rightarrow G \) with \( h_{g_2}(g) = g_2g_2^{-1} \) and \( L_{g_1}: \sum G \rightarrow \sum G \) with \( L_{g_1}(g_1', \ldots, g_n') = (g_1, g_1', \ldots, g_n') \). Let \( \tilde{f} \) be the direct sum of \( f_{(g_1, g_2)} \) for all \((g_1, g_2) \in G \times G\). Then by the property of the \( NF \) given above there must exist a function \( j' \) so that \( j' \tilde{f} = f_G \). This proves \( \text{size}(f_G) = \text{size}(\tilde{f}) = |L| = n \) proving the lemma and hence the corollary.
