DUALITY THEORY FOR LOCALLY COMPACT GROUPS
WITH PRECOMPACT CONJUGACY CLASSES. II:
THE DUAL SPACE
BY
TERJE SUND\(^{(1)}\)

ABSTRACT. The present paper is concerned with the dual space \( \hat{G} \) consisting of all unitary equivalence classes of continuous irreducible unitary representations of separable [FC] \(^{-}\) groups (i.e., groups with precompact conjugacy classes). The main purpose of the paper is to extend certain results from the duality theory of abelian groups and [Z] groups to the larger class of [FC] \(^{-}\) groups. In addition, we deal briefly with square-integrability for representations of [FC] \(^{-}\) groups. Most of our results are proved for type I groups. Our key result is that \( \hat{G} \) may be written as a disjoint union of abelian topological \( T_4 \) groups, which are open in \( \hat{G} \).

Introduction. In [23] we studied the character space \( \hat{X}(G) \) of locally compact groups possessing precompact conjugacy classes ([FC] \(^{-}\) groups), and we were able to extend much of the classical duality theory for abelian groups\(^{(2)}\) to this larger class of groups using \( \hat{X}(G) \) as dual object.\(^{(3)}\) The present paper is concerned with the dual space \( \hat{G} \) of all unitary equivalence classes of continuous irreducible unitary Hilbert space representations of separable [FC] \(^{-}\) groups \( G \). \( \hat{G} \) is given the Fell topology, obtained from the hull kernel topology on the primitive ideal space of the group \( C^*\)-algebra \(^{(4)}\).

For an arbitrary locally compact group \( G \), insight into the structure of \( \hat{G} \) often tells more about the group itself than the corresponding knowledge of \( \hat{X}(G) \). This is partly due to the fact that the elements of \( \hat{G} \) always separate the points of \( G \), whereas a corresponding property\(^{(4)}\) holds for \( \hat{X}(G) \) if \( G \in [SIN] \) but not generally. Even in the case of a type I [FC] \(^{-}\) group the character...
space may constitute only a small part of the dual. For $\chi(G)$ is then isomorphic to
the dual space $\hat{G}/C$ of the $[FC]^− \cap [SIN]$ quotient group $G/C$, where $C$ denotes
the intersection of all closed invariant neighborhoods of $e$ in $G$ [18, Theorem 5.12].
We shall prove, e.g., that $\hat{G}$ is connected if and only if $G$ is aperiodic (i.e., $G$
contains no nontrivial compact subgroup). For $\chi(G)$ this result can hold only when
$G$ is replaced by $G/C$; see [23, (2.12)].

On the other hand, the character space $\chi(G)$ is a locally compact Hausdorff
space for $G \in [FC]^−$ [12], whereas $\hat{G}$ need not even be a $T_0$ space (but $\hat{G}$ is
always locally compact [4, 3.3.8]). In fact, $\hat{G}$ is $T_0$ iff $G$ is type I iff $\hat{G}$ is $T_4$
(1.3). Whenever our method of proof utilizes topological separation properties of
$\hat{G}$ it is therefore necessary (and sufficient) to assume that $G$ is type I. Under
this hypothesis we can show that $\hat{G}$ is locally Euclidean iff $G$ is compactly generated,
and $\hat{G}$ is locally connected iff $G$ possesses property (L).

In addition to extending classical duality results like the ones mentioned
above, this paper also briefly deals with square-integrable representations of $[FC]^−$ 
groups and we provide simple, necessary and sufficient conditions for $[\pi] \in \hat{G}$ to
be square-integrable.

For convenience we shall list the classes of groups with which we are dealing.

$[SIN]$ — The class of locally compact groups possessing a fundamental sys-
tem of invariant neighborhoods of $e$.

$[FC]^−$ — The class of locally compact groups possessing precompact conjuga-
cy classes.

$[FIA]^−$ — The locally compact groups with precompact inner automorphism
group. One has $[FIA]^− = [SIN] \cap [FC]^−$; see [10].

$[FD]^−$ — The locally compact groups with precompact commutator group.
The following inclusions hold: $[FIA]^− \subseteq [FC]^−$ and $[FD]^− \subseteq [FC]^−$
[10]. Of course, all the classes of groups listed above contain the abelian groups
and the compact groups.

If $\rho$ is a unitary representation of a closed subgroup $H$ of a locally compact
group $G$ we shall let $\text{Ind}^G_H(\rho)$ denote the unitary representation of $G$ induced
from $\rho$. If $\pi$ is a representation of $G$, $\pi_H$ will denote the representation of the
subgroup $H$ given by restriction, $\pi_H(h) = \pi(h)$, all $h \in H$. Let $\pi$ and $\sigma$ be uni-
tary representations of $G$. We shall write $\pi \simeq \sigma$ if they are unitarily equivalent.
If the topological groups $G$ and $L$ are isomorphic, we shall use the notation
$G \cong L$. If $\pi \in \text{Irr}(G)$ [4, 18.5.1] we let $[\pi]$ denote the equivalence class of $\pi$ in $\hat{G}$.
For $S \subseteq \text{Irr}(G)$ we let $[S]$ be the image of $S$ in $\hat{G}$ under the canonical map $\pi \mapsto [\pi]$. Finally, we let $\rho'$ denote the representation of $G$ given by $\rho'(x) = \rho(xN)$ whenever $\rho$ is a representation of a factor group $G/N$.

We would like to mention at this point that E. Kaniuth recently obtained
results related to the present ones under somewhat different conditions on the

We thank the referee for several pertinent remarks, which led to improvements of the paper.

1. Groups with abelian quotients. Let G be a separable locally compact group of type I and suppose that N is a closed normal subgroup of G such that G/N is abelian. Assume also that N is type I and regularly embedded in G. In this section we shall analyze the dual of such groups. We shall assume the reader is familiar with Mackey's little group method, [1] and [17]. The main reason for the above hypothesis on G is that [FC] groups, which are our main concern in this paper, satisfy exact sequences of topological groups (e) → P → G → V × A → (e), where P is maximal periodic, A is abelian, discrete, and aperiodic, and V is isomorphic to R^n for some n [10, Theorem (3.16)]. Some condition on G like type I-ness is necessary in the following result.

1.1 Proposition. Let G and N be as above. If [π] ∈ PathVariable then the set

\[ \hat{G}_{π,N} = \{(γ) ∈ PathVariable: γ_N \text{ quasi-equivalent to } π_N\} \]

equals [π_N] ⊗ π.

Proof. Suppose [γ] ∈ PathVariable, and let [ρ] ∈ N be an element of the G-orbit θ_π in N which is determined by π [1]. Let K(π) be the stability group of ρ under G's action on N by inner automorphisms. By the Mackey theory there is a [σ] ∈ K(π) so that the induced representation Ind_K(π)(σ) is equivalent to π. Moreover, σ may be constructed as follows: There is a multiplier ω on K(π)/N such that ρ extends to an ω representation of K(π). Let \( \tilde{ρ} \) be any such extension of ρ; then there exists an irreducible \( \omega \) representation \( \beta \) of K(π)/N such that \( \beta \otimes \tilde{ρ} \approx \sigma \). Because of our hypothesis on G and N, all primary \( \omega \) representations of K(π)/N are type I [17, Theorem 8.4], and it follows from [3, Theorem (3.3)], together with [3, Theorem (3.1)], that all the irreducible \( \omega^{-1} \) representations of K(π)/N are on the form \( \beta \otimes \chi \) where \( \chi \) is some character of K(π)/N. From this it follows that every [γ] ∈ PathVariable is induced from representations of the form \( \chi' \otimes \beta' \otimes \tilde{ρ} = \chi' \otimes \sigma \). Observe now that

\[ \text{Ind}_{K(π)}^G(\chi' \otimes \sigma) \simeq \hat{\chi}' \otimes \text{Ind}_{K(π)}^G(σ) \]

where \( \hat{\chi} \) is any extension of the character \( \chi \) to G/N and \( \hat{\chi}' \) denotes the lift of \( \hat{\chi} \) to G [7, Lemma 4.2]. This completes our proof.(§)

The following result is well known and will be helpful when combined with (1.1).

1.2 Lemma. Let G be a separable locally compact group and let K be a compact normal subgroup. Then \( \hat{G}_{π,K} = \{(γ) ∈ PathVariable: γ_K \text{ quasi-equivalent to } \} \)

(§) A different proof of (1.1) was pointed out to the author by J. Brezin. Brezin's proof also uses the Mackey theory.
\( \pi_K \) is an open and closed subspace of \( \hat{G} \).

**Proof.** If \( [\pi] \in \hat{G} \) let \( \theta_{\pi} \) be the \( G \)-orbit in \( \hat{K} \) associated to \( [\pi] \); the map \( p: [\pi] \mapsto \theta_{\pi}, \hat{G} \to \hat{K}/G \) is continuous [6, Lemma 3] (the orbit space \( \hat{K}/G \) is given the quotient topology induced from \( \hat{K} \)). Since \( K \) is compact, \( \hat{K} \) and \( \hat{K}/G \) are discrete. The result now follows from the fact that \( \hat{G}_{\pi,K} = p^{-1}(\{\theta_{\pi}\}) \).

Q.E.D.

Let \( G \) be a locally compact separable type I group and suppose that \( K \) is a compact normal subgroup of \( G \) such that \( G/K \) is abelian.\(^{(6)}\) Let \( \pi \in \text{Irr}(G) \) be fixed but arbitrary.

There is a natural map \( f_\pi \) of \( \hat{G}/K \) onto \( [G/K \otimes \pi] \) given by \( \alpha \mapsto [\alpha' \otimes \pi] \).

We let \( M_\pi = [G/K \otimes \pi] \) and provide \( M_\pi \) with the topology induced from \( \hat{G} \).

We may define a natural group structure on \( M_\pi \) by letting

\[ [\alpha' \otimes \pi] \ast [\beta' \otimes \pi] = [\alpha'\beta' \otimes \pi], \quad \alpha, \beta \in \hat{G}/K. \]

It is easy to check that the product \( \ast \) is well defined. Moreover, \( \hat{G}/K \) acts on \( M_\pi \) as a locally compact Hausdorff topological transformation group. Indeed, the map \( (\alpha, [\alpha' \otimes \pi]) \mapsto [\alpha'\beta' \otimes \pi] \) from \( \hat{G}/K \times M_\pi \) onto \( M_\pi \) is continuous, and the map \( \alpha \mapsto ([\beta' \otimes \pi] \mapsto [\alpha'\beta' \otimes \pi]) \) is a homomorphism of \( \hat{G}/K \) into the group of homeomorphisms of \( M_\pi \), and the map \( [\alpha' \otimes \pi] \mapsto [\alpha'_0\alpha' \otimes \pi] \) is a homeomorphism for each \( \alpha'_0 \in \hat{G}/K \). Since \( M_\pi/G/K \) consists of one point, it is certainly \( T_0 \) and it follows from J. Glimm [8, Theorem 1], that the map \( \alpha \cdot G(\pi) \mapsto [\alpha' \otimes \pi] \) from \( \hat{G}/K/G(\pi) \) onto \( M_\pi \) is a homeomorphism, where \( G(\pi) = \{ \alpha \in \hat{G}/K: \alpha' \otimes \pi \simeq \pi \} \) is the stability group of \( [\pi] \). Here the type I hypothesis was needed. Since the quotient map \( \hat{G}/K \to \hat{G}/K/G(\pi) \) is open, it follows that \( f_\pi \) is open and \( M_\pi \) is Hausdorff. It also follows that \( M_\pi \) is a topological group with the product \( \ast \) defined above, and \( M_\pi \) may be identified with the quotient group \( \hat{G}/K/G(\pi) \). Thus \( M_\pi \) is even \( T_4 \) by abelian theory [11]. We have almost proved the following theorem.

**(1.3) Theorem.** Let \( G \) be a separable locally compact group with a compact normal subgroup \( K \) such that the factor group \( G/K \) is abelian. Then the following statements are equivalent.

1. \( G \) is of type I.
2. \( \hat{G} \) is the disjoint union of locally compact abelian topological \( T_4 \) groups \( [G/K \otimes \pi] \) which are open in \( \hat{G} \).
3. \( \hat{G} \) is \( T_4 \).

\(^{(6)}\) The following arguments hold whenever \( [G/K \otimes \pi] \) is closed in \( \hat{G} \) since \( [G/K \otimes \pi] \) is then locally compact. We shall only need to consider compact \( K \).
Proof. (1) $\Rightarrow$ (2). If $G$ is type I then $\hat{G}_{\pi,K}$ equals $[\hat{G}/K \otimes \pi]$ for all $[\pi] \in \hat{G}$, by (1.1). Hence the implication follows from (1.2) and the arguments above. (2) $\Rightarrow$ (3) $\Rightarrow$ (1) is obvious. Q.E.D.

Note. As observed in [16] a separable type I $[FC]^-$ group is $[FD]^-$.
Moreover, a group satisfies the hypothesis of (1.3) iff it is $[FD]^-$.
Hence it is clear that Theorem (1.3) is a result about $[FC]^-$ groups.

In this connection we note that J. Liukkonen [16, Theorem 3.6], proved that separable $[FC]^-$ groups of type I have Hausdorff duals. We feel that our proof of this result is simpler than the one given in [16], but more important, Theorem (1.3) reduces the study of the duals of such groups to the study of abelian character groups. This will be needed in the proofs of our subsequent results.

The following characterizations of connected components (c.c.'s) will also be useful (see the proof of (2.1)).

(1.4) Proposition. Let $G$ be a separable $[FC]^-$ group of type I, and let $[\pi] \in \hat{G}$. Then the connected component of $[\pi]$ is $[\hat{G}/P \otimes \pi]$ where $P$ denotes the periodic subgroup of $G$.

Proof. If $G$ is of type I we may choose a compact normal subgroup $K$ such that $G/K$ is abelian (see the note above). Let $[\pi] \in \hat{G}$. Since $[\hat{G}/K \otimes \pi]$ is open and closed, it suffices to argue in this subspace of $\hat{G}$. Let

$$f_\pi: \alpha \mapsto [\alpha \otimes \pi], \quad \hat{G}/K \to [\hat{G}/K \otimes \pi]$$

be the canonical map. As we have seen (in front of Theorem (1.3)) $f_\pi$ is an open and continuous homomorphism between abelian groups. Hence, since $[\hat{G}/K \otimes \pi]$ is $T_0$ with the relative topology from $\hat{G}$, the c.c. of $[\pi]$ in $[\hat{G}/K \otimes \pi]$ equals $f_\pi(C)$ where $C$ is the c.c. of 1 in $\hat{G}/K$ [11, 7.12]. Now the periodic subgroup of $G/K$ equals $P/K$ so by abelian theory [11, 24.17] $C$ equals $(G/K/P/K)^\sim \approx (G/P)^\sim$. Thus the c.c. of $[\pi]$ is $[\hat{G}/P \otimes \pi]^-$. Q.E.D.

In case the periodic group $P$ is compact $\hat{G}_{\pi,P}$ is closed for all $[\pi] \in \hat{G}$ by (1.2). Moreover, $[\hat{G}/P \otimes \pi]$ equals $\hat{G}_{\pi,P}$ (1.1). Hence we have

(1.5) Corollary. Let $G \in [FC]^-$ be separable and of type I. Assume that the periodic group $P$ is compact. If $[\pi] \in \hat{G}$ then its connected component is $[\hat{G}/P \otimes \pi]$.

2. Duality theory for $[FC]^-$ groups. We are now in a position to make an analysis, like we did for the character space $\chi(G)$ in [23], of the dual space $\hat{G}$ for separable $[FC]^-$ groups. First we observe that if $K$ is a compact normal subgroup of $G$ and $[\pi] \in \hat{G}$, then the restriction $\pi_K$ is equivalent to a direct sum.
318 TERJE SUND

$m \cdot \bigoplus \omega$ where $m$ is some (at most countable) cardinal number and the sum is taken over some $\hat{G}$-orbit in $\hat{K}$ under the action of $G$ on $\hat{K}$ by inner automorphisms. Observe also that $\hat{G}_{n,K}$ consists of all elements in $G$ which lie over the same $G$-orbit as $[\pi]$. Using this together with Theorem (1.3) and the fact that $C_\pi = [G/P \otimes \pi]^{-}$ for type I groups, we shall prove results analogous to the ones in §2 and 3 of [23]. We shall also discuss square-integrable representations.

(2.1) Proposition. Let $G$ be a separable $[FC]^{-}$ group. Then the following results hold

1. $\hat{G}$ is connected iff $G$ is aperiodic.
2. Let $G$ be type I. Then $\hat{G}$ is totally disconnected iff $G$ is periodic.
3. If $G$ is type I and the periodic subgroup $P$ is finite then $\hat{G}$ has finitely many connected components. If $G \in [FIA]^{-}$ and $\hat{G}$ has finitely many connected components, then the periodic subgroup $P$ of $G$ is finite.
4. Let $G$ be type I. $\hat{G}$ is locally Euclidean iff $G$ is compactly generated.

Proof. (1) If $\hat{G}$ is connected then the component $C_\iota$ of the trivial representation $\iota$ constitutes all of $\hat{G}$. But $C_\iota$ is easily seen to equal $G/P$ even in the non-type I case. By the Gel'fand-Raikov theorem, $P = (e)$ and $G$ is aperiodic. Conversely, if $G$ is aperiodic then $G$ is abelian [10]. Hence $\hat{G}$ is connected by abelian theory.

(2) Assume $\hat{G}$ is totally disconnected and let $P$ be the periodic subgroup of $G$. Then $G/P = C_\iota$ is trivial, hence $G = P$. Conversely, if $G$ is of type I and $G = P$, let $[\pi] \in \hat{G}$. By (1.4) the connected component of $[\pi]$ equals $[G/P \otimes \pi]^{-} = [\pi]^{-} = [\pi]$ since by hypothesis points are closed in $\hat{G}$. Hence $\hat{G}$ is totally disconnected.

(3) Let $G$ be type I and suppose $P$ is finite. Then there is only a finite number of $G$-orbits in $\hat{G}$, and hence there is only a finite number of different connected components $[G/P \otimes \pi] = \hat{G}_{n,P}$ (1.5). Conversely, let $G \in [FIA]^{-}$ and suppose $\hat{G}$ has only a finite number of connected components $C_\pi$. Then each $C_\pi$ is open and closed in $\hat{G}$. Let $\#: [\pi] \mapsto \pi \#$ be the canonical map of $\hat{G}$ onto $X(G)$ [18, 5.1 and 5.8]. $\#$ is an open and continuous map; hence it maps the open $C_\pi$ onto the connected component $C_{\pi \#}$ of the character $\pi \#$ in $X(G)$. Therefore $X(G)$ has only a finite number of connected components, and it follows from [23, Proposition (2.10)], that the periodic subgroup $P$ of $G$ is finite.

(4) Let $G$ be type I and fix a compact normal subgroup $K$ of $G$ such that $G/K$ is abelian. In view of Theorem (1.3), $\hat{G}$ is locally Euclidean iff $G/K$ is locally Euclidean. By abelian theory [19, Corollary 1 to Theorem 2.5], the last assertion holds iff $G/K$ is compactly generated, which is equivalent to $G$ being compactly generated. Q.E.D.

We say that $G$ is an $(L)$ group if every compact subset $F$ of $G$ is contained
in an open compactly generated normal subgroup $N$ of $G$ such that $G/N$ is aperiodic [20].

(2.2) Proposition. (1) Let $G \in [FC]^{-}$ be separable and type I. Then $\widehat{G}$ is locally connected if $G$ is an (L) group.

(2) Let $G$ be an $[FD]^{-}$ group. Then $G$ is an (L) group if $G$ is locally connected.

Proof. (1) Suppose $G$ is an (L) group. Arguing as in the proof of [23, Proposition (3.4)] (with $B = I(G)$), we see that the periodic subgroup $P$ is compact. If $G$ is type I each connected component $C_\pi$ is of the form $[\widehat{G}/\widehat{P} \otimes \pi] = \widehat{G}_\pi, P$ and is open and closed in $\widehat{G}$ since $P$ is compact, (1.1) and (1.2). Also, the canonical map $\widehat{G}/\widehat{P} \rightarrow [\widehat{G}/\widehat{P} \otimes \pi]$ is open and continuous so that it suffices to prove that $\widehat{G}/\widehat{P}$ is locally connected. Since our proposition holds for abelian groups (K. Fan [5]), the problem is reduced to showing that $G/P = \mathbb{R}^n \times A$ (where $A$ is discrete abelian and aperiodic) is an (L) group if $G$ is an (L) group, and this was proved in the last part of [23, Proposition (3.3)].

(2) Conversely, suppose $G \in [FD]^{-}$ and $\widehat{G}$ is locally connected. Let $C$ denote the intersection of all compact invariant neighborhoods of $e$ in $G$. It is easy to check that $G$ is an (L) group whenever $G/C$ is so (see [23, proof of Proposition (3.5)]). Let us show that $G/C$ is an (L) group. Since $C$ is compact, $\widehat{G}/\widehat{C}$ is naturally embedded in $\widehat{G}$ as an open subspace; hence $\widehat{G}/\widehat{C}$ is locally connected. Now $G/C \in [FIA]^{-}$ so we may apply the open and continuous surjection $\#: \widehat{G}/\widehat{C} \rightarrow \chi(G/C)$ (see the proof of (2.1)). Thus $\chi(G/C)$ is locally connected and it follows from [23, Proposition (3.5)], that $G/C$ is an (L) group. Q.E.D.

Finally, we turn to the question of square-integrability for representations of $[FC]^{-}$ groups. We say that $[\pi] \in \widehat{G}$ is square-integrable if all the coordinate functions $x \mapsto (\pi(x)u, u)$ of $\pi$ are in $L^2(G)$ w.r.t. left Haar measure on $G$. If $G$ is unimodular, $[\pi]$ is square-integrable iff $\pi$ occurs in the left regular representation of $G$ as a subrepresentation [4]. It is known that $[FC]^{-}$ groups are unimodular.

(2.3) Theorem. Let $G$ be a separable and type I $[FC]^{-}$ group, and fix $[\pi] \in \widehat{G}$. Then the following three statements are equivalent.

(1) $[\pi]$ is square-integrable.

(2) There is a compact normal subgroup $K$ of $G$ such that $G/K$ is abelian and $[\widehat{G}/\widehat{K} \otimes \pi] = [\pi]$.

(3) $[\pi]$ is open in $\widehat{G}$.

Each of the above statement implies the following.

(4) $[\widehat{G}/\widehat{P} \otimes \pi] = [\pi]$, where $P$ is the periodic subgroup of $G$.

Proof. (1) $\Rightarrow$ (2). Let $[\pi] \in \widehat{G}$ be square-integrable, and let $\rho$ be an irreducible subrepresentation of $\pi_K$. If $G(\rho)$ is the stability group of $\rho$ under
G's action by inner automorphisms, we know from the Mackey theory that there is a multiplier ω: G(ρ)/K × G(ρ)/K → T such that ρ extends to an ω-representation ρ̃ of G(ρ) [17]; moreover there is an ω⁻¹ representation ω' of G(ρ) (which is the identity operator on K) such that π is induced from the ordinary representation ρ̃ ⊗ ω'. Let σ be the representation of G(ρ)/K given by ω', and set S_ω = {x ∈ G(ρ): ω(x, y) = ω(y, x), all y ∈ G(ρ)}. We have σ = α ⊗ γ where α is a character of G(ρ)/K and γ is an ω⁻¹ representation of G(ρ)/S_ω [3, Theorem 3.1] (replace ω by a similar multiplier, if necessary). Hence ω' equals α times the identity operator on S_ω. Using [14, Corollary 11.1] we see that σ' is a square-integrable ω⁻¹ representation, and since σ'(s) = α(s)I on S_ω it is clear that S_ω is compact. S_ω is also normal in G, since G/S_ω is abelian. Moreover, the type I hypothesis on G implies that ω is a type I multiplier. Hence G(ρ)/S_ω has the unique irreducible ω⁻¹ representation γ [3, Theorem 3.3]. Hence

\((\rhõ ⊗ ω') ⊗ β = \rhõ ⊗ (α ⊗ γ') ⊗ β = \rhõ ⊗ ω',\)

for all characters β of G(ρ) which are one on S_ω. Using the fact that

\(\text{Ind}_{G(\rho)}^G(\rhõ ⊗ ω') ⊗ \chi = \text{Ind}_{G(\rho)}^G(\rhõ ⊗ ω') \otimes \chi)\)

where χ is any character of G(ρ) equal to one on K and χ̃ is any extension of χ to G [7, Lemma 4.2], we now have

\(\rhõ \otimes \chĩ = \text{Ind}_{G(\rho)}^G(\rhõ \otimes \omega' \otimes \chi) = \text{Ind}_{G(\rho)}^G(\rhõ \otimes \omega') \simeq \pi,\)

for any character χ̃ of G which is one on S_ω, and where χ denotes its restriction to G(ρ). Hence \([\hat{G}/S_\omega \otimes \pi] = [\pi]\), and (2) follows.

(2) ⇒ (3). If \([\hat{G}/K \otimes \pi] = [\pi]\) for some compact K then \([\pi]\) is open in \(\hat{G}\) by (1.1) and (1.2).

(3) ⇒ (1). If \([\pi]\) is open in \(\hat{G}\) then \([\pi]\) is square-integrable by [4, 19.8.5], since \(μ([\pi]) > 0\), where μ denotes the Plancherel measure for G. (It is known that [FC] groups are amenable [15], i.e., \(\hat{G} = \hat{G}_p\) where \(\hat{G}_p\) denotes the reduced dual of G. We needed this fact here to ensure that \([\pi] \in \hat{G}_p\).

(2) ⇒ (4). Suppose there is a compact normal subgroup K of G such that G/K is abelian and \([\hat{G}/K \otimes \pi] = [\pi]\). Then K ⊂ P and we have

\([\pi] \in [\hat{G}/P \otimes \pi] \subset [\hat{G}/K \otimes \pi] = [\pi]\)

so that \([\pi] = [\hat{G}/P \otimes \pi]\). Q.E.D.

Added in proof. The author has extended Theorem (2.3), (3), to separable [IN] groups (Isolated points in duals of certain locally compact groups, to appear in Math. Ann.).
