ADDITIVE COHOMOLOGY OPERATIONS

JEANNE DUFLOT

ABSTRACT. The bigraded group \( \{H_i(\Sigma_n, \mathbb{Z}/p)\} \) becomes a Hopf algebra, if multiplication is induced by restriction, and comultiplication is induced by transfer. Using Steenrod's method of considering elements of this bigraded group as mod-\( p \) cohomology operations, the primitives of this Hopf algebra correspond to additive cohomology operations. In this paper we use the results known about the homology and cohomology of the symmetric groups and the operations they induce in mod-\( p \) cohomology to write down two (additive) bases of the bigraded vector space of primitives of the above Hopf algebra.

0. Introduction

Let \( \Sigma_n \) denote the symmetric group on \( n \) letters. There is a graded Hopf algebra \( R_\ast = \bigoplus_{n \geq 0} R_C(\Sigma_n) \) where \( R_C(\Sigma_n) \) is the complex representation ring of the symmetric group \( \Sigma_n \). The multiplication is given by induction of representations, the comultiplication by restriction of representations. Let \( R_\ast^{\text{dual}} \) denote the graded \( \mathbb{Z} \)-dual of \( R_\ast \); Atiyah [1] shows how \( R_\ast^{\text{dual}} \) embeds in the set of natural transformations of \( K^0 \) (considered as a set-valued functor) and proves directly that the primitives in \( R_\ast^{\text{dual}} \) give additive operations on \( K^0 \) — the Adams operations. Moreover, one knows exactly the primitives of \( R_\ast \), and therefore also of \( R_\ast^{\text{dual}} \) since \( R_\ast \) is a self-dual Hopf algebra (see, e.g., [8]).

Now, let \( p \) be a fixed prime number. Consider the bigraded group (as in [3]) \( H_{\ast\ast} = \{H^i(\Sigma_j)\}_{i \geq 0, j \geq 0} \). (All homology and cohomology groups, unless otherwise denoted, have coefficients in \( \mathbb{Z}/p \).) In [3], it is pointed out that

(a) \( H_{\ast\ast} \) is a bigraded Hopf algebra with multiplication induced by transfer; specifically by the transfer maps induced by the (standard) inclusions \( \Sigma_i \times \Sigma_m \to \Sigma_{i+m} \). Comultiplication is given by restriction maps induced by the above inclusions.

(b) The bigraded dual of \( H_{\ast\ast} \) is isomorphic as a Hopf algebra to \( \tilde{H}_{\ast\ast} = \{H^i(\Sigma_j)\}_{i \geq 0, j \geq 0} \), where multiplication is induced by restriction, and comultiplication is induced by transfer.

(c) Using Steenrod's method [21] of considering elements of \( H_\ast(\Sigma_n) \) as mod-\( p \) cohomology operations, the primitives of \( \tilde{H}_{\ast\ast} \) (with respect to the transfer comultiplication) correspond to additive cohomology operations. (See

1980 Mathematics Subject Classification (1985 Revision). Primary 55S05; Secondary 20J06.
McClure [13] for a much more general proof of this fact.) More precisely, a primitive \( \alpha \in H^i(\Sigma_n) \) corresponds to a sequence of additive cohomology operations \( \hat{\alpha}_q : H^q \to H^{q-n} \). (Here, for simplicity, we assume that \( q \) is even if \( p \) is odd.) From now on, if \( \alpha \in H^i(\Sigma_n) \) we denote by \( \hat{\alpha} \) or \((\alpha)^\wedge\) the cohomology operation corresponding to \( \alpha \). If we wish to specify \( \hat{\alpha} \) as acting only in the cohomology degree \( q \), we write \( \hat{\alpha}_q \).

In this paper we continue the investigation of [3] by using the results known about the homology and cohomology of the symmetric groups and the operations they induce in mod-\( p \) cohomology to write down two (additive) bases of the bigraded vector space of primitives (with respect to the transfer comultiplication) of \( \hat{H}_{**} \).

We also investigate the wreath product on \( \hat{H}_{**} \) (which corresponds to composition of cohomology operations).

1. Two bases for the primitives in \( \hat{H}_{**} \)

Let \( P_{**} \) and \( Q_{**} \) (resp. \( \widehat{P}_{**} \) and \( \widehat{Q}_{**} \)) denote the primitives and indecomposables of the Hopf algebra \( H_{**} \) (resp. \( \hat{H}_{**} \)). Let \( V^n \) be a vector space of dimension \( n \) over \( \mathbb{Z}/p \); fix a one-to-one correspondence between \( V^n \) and \( \{1, 2, \ldots, p^n\} \). Using this correspondence, the set of translations \( E_n \) of \( V^n \) is embedded in \( \Sigma_{p^n} \); say \( i : E_n \to \Sigma_{p^n} \) is the embedding. Of course, \( E_n \) is an elementary abelian \( p \)-subgroup of \( \Sigma_{p^n} \) of rank \( n \). Let \( j : \Sigma_{p^{n-1}} \times \cdots \times \Sigma_{p^{n-1}} \to \Sigma_{p^n} \) be the “usual” embedding.

We will make use of the following lemmas.

**Lemma 1** [3]. \( Q_{**} \cdot n = P_{**} \cdot n = \widehat{Q}_{**} \cdot n = \widehat{P}_{**} \cdot n = 0 \) if \( N \) is not a power of \( p \). \( \square \)

Let \( \alpha : G \to H \) be an inclusion of groups; we make the following table of notation

| \( \alpha^* \) | cohomology restriction |
| \( \alpha_* \) | homology restriction |
| \( \alpha^! \) | homology transfer |
| \( \alpha_! \) | cohomology transfer |

**Lemma 2.** (a) \( Q_{**} \cdot p^n = H^* (\Sigma_{p^n}) / \text{im} j_i^* \), (b) \( \widehat{P}_{**} \cdot p^n = \ker j_i^! \).

**Proof.** Statement (a) is Corollary 7 of [3]. Statement (b) follows from (a) by duality; or can be proved directly using the same methods as for (a). \( \square \)

**Lemma 3.** (a) \( \text{im} j_i \subseteq \ker i_*^* \), (b) \( \text{im} i_* \subseteq \ker j_i^! \).

**Proof.** (a) is a theorem of Steenrod’s; see, e.g., [11 or 16].

(b) follows by duality from (a). \( \square \)

We will also need the following details from calculations of Nakaoka [19] and Cartan [2]. We adopt the notation of the above-cited works of Cartan and Nakaoka.
Let $Z^+ = \{n \in \mathbb{Z} | n \geq 0\}$. Let $q$ be a fixed positive even integer. Let $J_p = \{(a_1, a_2, \ldots, a_j, \ldots) \in \bigcup_{n \geq 1} \{(Z^+)\} | \exists i \geq 1 \text{ such that } a_i \neq 0, \ a_j \geq pa_{j+1} \text{ for each } j \geq 1; \ a_j \equiv 0 \text{ or } 1 \mod 2(p - 1) \}$. If $(\ )$ denotes the empty sequence of integers, let $J_p^* = J_p \cup \{(\ )\}$. If $I = (a_1, a_2, \ldots) \in J_p$ define $d(I) = \sum_{i=1}^{\infty} a_i$ (the degree of $I$); $e(I) = [pa_i/(p - 1)] - d(I)$ (the excess of $I$); $l(I) = \max\{|j|a_j \neq 0\}$ (the length of $I$); and $r(I) = p^{l(I)}$ (the rank of $I$).

Extend these functions to $J_p^*$ by defining $d((\ )) = e((\ )) = l((\ )) = 0$; so that $r((\ )) = 1$. As in Nakaoka [19], define $\Omega(p,q) = \{I \in J_p^* | e(I) < q \text{ and if } l(I) = j \text{ then } a_j > 1 \text{ when } I = (a_1, \ldots, a_j, 0, \ldots)\}$. Define $U(p,q)$ to be the $\mathbb{Z}/p$-algebra generated by all elements $I \in \Omega(p,q)$ subject to the relations $IJ = (-1)^{d(I) + d(J)}IJ$ for $I, J \in \Omega(p,q)$. The algebra $U(p,q)$ is of course generated as a vector space by monomials $I_1^{a_1} \cdots I_k^{a_k}$; one can extend the definition of rank to the set of nonzero monomials so that $r(I_1^{a_1} \cdots I_k^{a_k}) = \sum_{j=1}^{k} a_j r(I_j)$ for each nonzero monomial $I_1^{a_1} \cdots I_k^{a_k}$. One can also define the $q$-degree of a nonzero monomial as

$$q\text{-deg}(I_1^{a_1} \cdots I_k^{a_k}) = \sum_{j=1}^{k} a_j(q + d(I_j)).$$

(Of course, $r(0) = 0 = q\text{-deg}(0)$.) We then define $U(p,q)^d$ to be the subspace of $U(p,q)$ generated by all monomials of $q$-degree $d$, and $U(p,q)^d$ to be the subspace of $U(p,q)^d$ generated by all monomials of $q$-degree $d$ and rank $r$.

Then $U(p,q) = \bigoplus_{d \geq 0,r \geq 0} U(p,q)^d$ becomes a bigraded algebra over $\mathbb{Z}/p$.

As in Cartan [2], for each $I = (a_1, a_2, \ldots) \in J_p$, define the natural transformation $St^I : H^n(-, \mathbb{Z}/p) \to H^{n+d(I)}(-, \mathbb{Z}/p)$ by $St^I = St^{a_1} \circ St^{a_2} \circ \cdots$ where

$$St^a = \begin{cases} S^a, & p = 2, \\ \mathbb{B}^{\beta^a}, & p > 2 \text{ and } a = 2s(p - 1) + \varepsilon. \end{cases}$$

For $I = (\ )$, define $St^I$ = identity.

Now, we consider the symmetric products $SP^mS^q$ of the $q$-sphere for $0 \leq m \leq \infty$; let $i_{m,n} : SP^mS^q \to SP^nS^q$ for $0 \leq m \leq n \leq \infty$ denote the usual inclusions. Using the Dold-Thom theorem, we recognize $SP^\infty S^q$ as an Eilenberg-Mac Lane space $K(\mathbb{Z}, q)$. Let $i_m$ be a generator for $H^q(SP^mS^q) \cong \mathbb{Z}/p$ for $0 \leq m \leq \infty$; assume that these generators are chosen so that $i_{m,n}(i_n) = i_m$ for $0 \leq m \leq n \leq \infty$.

Nakaoka [19] defined homomorphisms of $\mathbb{Z}/p$-algebras

$$T_m : U(p,q) \to H^*(SP^mS^q) \text{ for } 0 \leq m \leq \infty$$

by $T_m(I) = St^I(i_m)$; notice that $T_m(U(p,q)^d) \subseteq H^d(SP^mS^q)$. Define the vector space homomorphisms

$$\Phi_{\alpha,m} : H_n(S^m) \to H^{mq-\alpha}(SP^\infty S^q) = H^{mq-\alpha}(K(\mathbb{Z}, q)) = H^{mq-\alpha}(\mathbb{Z}, q, \mathbb{Z}/p)$$
and
\[ \kappa_{\alpha,m} : H_\alpha(\Sigma_m) \to H^{mq-\alpha}(SP^mS^q) \quad (\text{for } 0 \leq m < \infty) \]
by \( \Phi_{\alpha,m}(c) = \hat{\kappa}_{q}(t_m) \) and \( \kappa_{\alpha,m}(c) = \hat{\kappa}_{q}(t_m) \).

**Theorem 4** (Nakaoka [19], Cartan [2], Steenrod). If \( q > \alpha + 1 \), there exist vector spaces \( V_{\alpha,m} \) and vector space homomorphisms \( \xi_{\alpha,m} : V_{\alpha,m} \to H_\alpha(\Sigma_m) \), \( \chi_{\alpha,m} : V_{\alpha,m} \to U(p,q)_{m}^{mq-\alpha} \) (\( m < 0 \); see Nakaoka [19] for a precise definition of \( V_{\alpha,m} \), \( \xi_{\alpha,m} \) and \( \chi_{\alpha,m} \)) such that

(a) the diagrams below commute

\[
\begin{array}{ccc}
V_{\alpha,m} & \xrightarrow{\xi_{\alpha,m}} & H_\alpha(\Sigma_m) \\
\downarrow & & \downarrow \\
U(p,q)_m^{mq-\alpha} & \xrightarrow{T_m=T_m|U(p,q)_m^{mq-\alpha}} & H^{mq-\alpha}(SP^mS^q)
\end{array}
\]

where \( \chi_{\alpha,m,\infty} = \lambda \circ \chi_{\alpha,m} \) with \( \lambda : U(p,q)_m^{mq-\alpha} \hookrightarrow U(p,q)_{\infty}^{mq-\alpha} \).

(b) \( \xi_{\alpha,m}, \kappa_{\alpha,m}, \chi_{\alpha,m} \) and \( T_m \) are isomorphisms for \( m < \infty \). (For \( \xi_{\alpha,m}, \chi_{\alpha,m} \) and \( T_m \) this is due to Nakaoka [19]; for \( \kappa_{\alpha,m} \), this is due to Steenrod, see [19].)

(c) \( T_\infty \) is an isomorphism (Cartan [2], Nakaoka [19]).

(d) \( \Phi_{\alpha,m} \) is injective (Steenrod; see [19]).

**Proof.** Nakaoka [19] proves commutativity of the first diagram in (a) directly, but the same proof works for the second diagram in (a). For (b), (c), (d) refer to the references cited in the theorem. \( \Box \)

**Corollary 5.** \( \Phi_{\alpha,m} = T_\infty \circ \lambda \circ T_m^{-1} \circ \kappa_{\alpha,m} \); where \( \lambda : U(p,q)_m^{mq-\alpha} \hookrightarrow U(p,q)_{\infty}^{mq-\alpha} \) is as in Theorem 4. \( \Box \)

Let \( A^d(Z,q,Z/p) \) be the subspace of \( H^d(Z,q,Z/p) \) consisting of the additive natural transformations \( H^q(-,Z) \to H^d(-,Z/p) \). From now on, fix \( \alpha \); assume \( q \) is an even integer such that \( q > \alpha + 1 \); let \( m = p^n \) for some \( n \geq 0 \).

**Corollary 6.**

\[ \Phi_{\alpha,p^n}(\tilde{P}_{\alpha,p^n}) \subseteq T_\infty \lambda(U(p,q)_{p^n}^{p^\alpha q-\alpha}) \cap A^{p^\alpha q-\alpha}(Z,q,Z/p) \]

**Proof.** Corollary 5 shows that

\[ \Phi_{\alpha,p^n}(\tilde{P}_{\alpha,p^n}) \subseteq T_\infty \lambda(U(p,q)_{p^n}^{p^\alpha q-\alpha}) \]

Let \( A^{p^\alpha q-\alpha}(Z,q,Z/p) \) be the subspace of

\[ H^{p^\alpha q-\alpha}(Z/p,q,Z/p) = H^{p^\alpha q-\alpha}(K(Z/p,q),Z/p) \]

License or copyright restrictions may apply to redistribution; see https://www.ams.org/journal-terms-of-use
consisting of the additive natural transformations
\[ H^q(\cdot, \mathbb{Z}/p) \to H^{p^aq-\alpha}(\cdot, \mathbb{Z}/p). \]

Let \( \tilde{\Phi}_{\alpha,p^n} : H_\alpha(\Sigma_{p^n}) \to H^{p^aq-\alpha}(\mathbb{Z}/p, q, \mathbb{Z}/p) \) given by \( c \mapsto \hat{c}_q(i) \) where \( i \) is a suitably chosen generator of \( H^q(\mathbb{Z}/p, q, \mathbb{Z}/p) \cong \mathbb{Z}/p \). Then there is a commutative diagram
\[
\begin{array}{ccc}
H^{p^aq-\alpha}(\mathbb{Z}, q, \mathbb{Z}/p) & \xrightarrow{\beta^*} & H_\alpha(\Sigma_{p^n}) \\
\downarrow{\Phi_{\alpha,p^n}} & & \downarrow{\tilde{\Phi}_{\alpha,p^n}} \\
H^{p^aq-\alpha}(\mathbb{Z}/p, q, \mathbb{Z}/p) & \xrightarrow{\hat{i}^*} & \mathbb{Z}/p
\end{array}
\]
(where \( \beta : K(\mathbb{Z}, q) \to K(\mathbb{Z}/p, q) \) is the map defined by the homomorphism \( \mathbb{Z} \to \mathbb{Z}/p \) such that \( \beta^*(A^{p^aq-\alpha}(\mathbb{Z}/p, q, \mathbb{Z}/p)) \subseteq A^{p^aq-\alpha}(\mathbb{Z}, q, \mathbb{Z}/p) \). To see this, choose \( i \) so that \( \beta^*(i) = i_\infty \). The diagram then commutes because \( \hat{c}_q \) is natural. Also, \( A^*(-, q, \mathbb{Z}/p) \) defines a functor on the category of abelian groups (Cartan \[2\]) so \( \beta^*(A^{p^aq-\alpha}(\mathbb{Z}/p, q, \mathbb{Z}/p)) \subseteq A^{p^aq-\alpha}(\mathbb{Z}, q, \mathbb{Z}/p) \). Now, by \[3\] or \[13\], \( \tilde{\Phi}_{\alpha,p^n}(\tilde{\Phi}_{\alpha,p^n}) \subseteq A^{p^aq-\alpha}(\mathbb{Z}/p, q, \mathbb{Z}/p) \); Corollary 6 follows. \( \Box \)

Define \( p^nH^{p^aq-\alpha}(\mathbb{Z}, q) = T_\infty(\lambda(U(p, q))^{p^nq-\alpha}). \)

**Corollary 7.** For \( n \geq 0 \), and \( \alpha \geq 0 \),

(a) \[
\dim \left( H^{p^aq-\alpha}(\mathbb{Z}, q) \cap A^{p^aq-\alpha}(\mathbb{Z}, q, \mathbb{Z}/p) \right) 
\geq \dim(\tilde{\Phi}_{\alpha,p^n}) = \dim(\ker j_\alpha) \geq \dim(\im i_\alpha),
\]

(b) \[
\dim \left( p^nH^{p^aq-\alpha}(\mathbb{Z}, q) \cap A^{p^aq-\alpha}(\mathbb{Z}, q, \mathbb{Z}/p) \right) 
\geq \dim(\tilde{\Phi}_{\alpha,p^n}) = \dim(\ker j_\alpha) \geq \dim(\im i_\alpha).
\]

**Proof.** The first inequalities follow from Corollary 6, the middle equalities from Lemma 2, and the last inequalities from Lemma 3. \( \Box \)

In fact, all the numbers in Corollary 7 are equal. It is possible to show this using results in Mann \[11\] to construct a proof (by counting bases) that \( \dim(\im j_\alpha) = \dim(\ker i^*_\alpha) \) for each \( \alpha \geq 0 \) and \( n \geq 0 \). However, we will prove (by counting bases).

**Theorem 8.**

\[
\dim(\im i_\alpha) = \dim(\im i^*_\alpha) = \dim \left( p^nH^{p^aq-\alpha}(\mathbb{Z}, q) \cap A^{p^aq-\alpha}(\mathbb{Z}, q, \mathbb{Z}/p) \right)
\]

for \( \alpha \geq 0 \) and \( n \geq 0 \).

**Proof.** This theorem follows directly from the following Theorems 9 and 10, Corollary 11, and Lemma 12 (plus duality for the first equality). \( \Box \)
Let \( A(p, q, n, \alpha) = \{I \in \Omega(p, q) | r(I) = p^n, q + d(I) = p^n q - \alpha\} \), if \( \alpha \geq 0 \) and \( n \geq 0 \).

**Theorem 9** (Cartan [2, §16, Theorem 1]).

\[
\dim \left( \rho_* H^{p^nq-\alpha}(Z, q) \cap A^{p^nq-\alpha}(Z, q, Z/p) \right) = \#A(p, q, n, \alpha)
\]

for \( \alpha \geq 0 \) and \( n \geq 0 \). \( \square \)

In the following theorem and corollary, we use the notation of Mui [16].

**Theorem 10** (Mui [16], Mann [11], Milgram-Madsen [10] (for \( p = 2 \))).

(a) If \( p = 2 \), then there are elements \( Q_{n,i} \in H^{2^n-2^i}(E_n) \) for \( 0 \leq i \leq n-1 \) such that \( \text{im } i^* = Z/2[Q_{n,0}, \ldots, Q_{n,n-1}] \). (If \( K \) is a field, \( K[x_1, \ldots, x_n] \) means the (graded) polynomial ring over \( K \) on \( \{x_1, \ldots, x_n\} \).)

(b) If \( p \) is odd, then there are elements \( Q_{n,i} \in H^{2(p^n-p^i)}(E_n) \) for \( 0 \leq i \leq n-1 \); \( R_{n,i} \in H^{2(p^n-p^i)}(E_n) \) for \( 0 \leq i \leq n-1 \) and \( R_{n,i,j} \in H^{2(p^n-p^i-p^j)}(E_n) \) for \( 0 \leq i < j \leq n-1 \) such that

\[
\text{im } i^* = \frac{Z/p[Q_{n,i}, R_{n,i}, R_{n,i,j}]}{|0 \leq i < j \leq n-1|}.
\]

(The notation \( (S) \) means the ideal generated by the set \( S \). The product here is the cup product.) \( \square \)

**Corollary 11.** Let \( (\text{im } i^*)_\alpha \) denote the homogeneous elements of degree \( \alpha \) in \( \text{im } i^* \). Then

(a) if \( p = 2 \), a basis (over \( Z/2 \)) of \( (\text{im } i^*)_\alpha \) is given by

\[
\left\{ Q_{n,0}^{r_0} Q_{n,1}^{r_1} \cdots Q_{n,n-1}^{r_{n-1}} | \sum_{i=0}^{n-1} r_i (2^n - 2^i) = \alpha \text{ and } r_i \geq 0 \text{ for } 0 \leq i \leq n-1 \right\}.
\]

(b) if \( p \) is odd, a basis (over \( Z/p \)) of \( (\text{im } i^*)_\alpha \) is given by the union of the following two sets:

\[
\left\{ R_{n,0}^{r_0} R_{n,1}^{r_1} \cdots R_{n,2i-1}^{r_{2i-1}} Q_{n,0}^{r_0} Q_{n,1}^{r_1} \cdots Q_{n,n-1}^{r_{n-1}} | \left\{ \lambda_1, \ldots, \lambda_{2i} \right\} \subseteq \{0, 1, 2, \ldots, n-1\} \text{ and } 0 \leq \lambda_0 < \lambda_1 < \cdots < \lambda_{2i} \leq n-1; \right. \\
0 \leq j \leq n-1; \sum_{j=1}^{2i} (p^n - 2p^{\lambda_j}) + (2(p^n - p^{\lambda_0}) - 1) + \sum_{j=0}^{n-1} 2r_j (p^n - p^j) = \alpha \right\}
\]
and
\[ R_{n,\lambda_1,\ldots,\lambda_{2i}} \cdots R_{n,\lambda_{2i-1,\ldots,\lambda_{2i}}}, Q_{n,0}^{f_0}, Q_{n,1}^{f_1}, \ldots, Q_{n,n-1}^{f_{n-1}} | \{ \lambda_1, \ldots, \lambda_{2i} \} \]
\[ \subseteq \{ 0, 1, \ldots, n - 1 \} \text{ and } 0 \leq \lambda_1 < \cdots < \lambda_{2i} \leq n - 1; r_j \geq 0 \]
for \( 0 \leq j \leq n - 1; \)
\[ \sum_{j=1}^{2i} (p^n - 2p^{i_j}) + \sum_{j=0}^{n-1} 2r_j (p^n - p^j) = \alpha \].

**Proof.** Left as an exercise using Theorem 10. \( \Box \)

Let
\[ X(2, n, \alpha) = \left\{ (\lambda_0, \lambda_1, \ldots, \lambda_{2i}) \mid (\lambda_0, \lambda_1, \ldots, \lambda_{2i}) \in (\mathbb{Z}^+)^n, \sum_{i=0}^{n-1} r_i (2^n - 2^i) = \alpha \right\} \]
and if \( p \) is odd,
\[ X_1(p, n, \alpha) = \left\{ (\lambda_0, \lambda_1, \ldots, \lambda_{2i}) \mid (\lambda_0, \lambda_1, \ldots, \lambda_{2i}) \in \mathcal{P}_{2i+1}([0, n-1]) \times (\mathbb{Z}^+)^n, \sum_{j=1}^{2i} (p^n - 2p^{i_j}) + [2(p^n - p^{i_0}) - 1] + \sum_{j=0}^{n-1} 2r_j (p^n - p^j) = \alpha \right\} \]
and
\[ X_2(p, n, \alpha) = \left\{ (S, (\lambda_0, \lambda_1, \ldots, \lambda_{2i})) \in \mathcal{P}_i([0, n-1]) \times (\mathbb{Z}^+)^n, \sum_{j=1}^{2i} (p^n - 2p^{i_j}) + \sum_{j=0}^{n-1} 2r_j (p^n - p^j) = \alpha \right\} \]
if \( 0 < i \) and \( S = \{ \lambda_1, \ldots, \lambda_{2i} \} \),
then
\[ \sum_{j=1}^{2i} (p^n - 2p^{i_j}) + \sum_{j=0}^{n-1} 2r_j (p^n - p^j) = \alpha; \]
if \( i = 0 \) then
\[ \sum_{j=0}^{n-1} 2r_j (p^n - p^j) = \alpha \].

(Here, \( [0, n-1] = \{ 0, \ldots, n-1 \} \); \( \mathcal{P}([0, n-1]) \) is the power set of \( [0, n-1] \); \( \mathcal{P}_k([0, n-1]) \) is the subset of \( \mathcal{P}([0, n-1]) \) consisting of sets of order \( k \). When we write elements of \( \mathcal{P}([0, n-1]) \) in the form \( \{ a, b, \ldots \} \) we will always assume that they are written in increasing order.)

**Lemma 12.** (Compare with May [12], Madsen [9].)

(a) If \( p = 2 \) there is a one-to-one correspondence
\[ F : A(2, q, n, \alpha) \leftrightarrow X(2, n, \alpha). \]
(b) If \( p \) is odd, there is a one-to-one correspondence

\[ F : A(p, q, n, \alpha) \longrightarrow X_1(p, n, \alpha) \square X_2(p, n, \alpha). \]

**Proof.** (Recall that \( q > \alpha + 1 \).) (a) \( F(a_1, \ldots, a_n) = (q - a_1 + a_2 + \cdots + a_n, a_1 - 2a_2, \ldots, a_n - 2a_{n-1}) \).

(b) If \( S \in \mathcal{P}([0, n-1]) \) let \( c(S) : [0, n-1] \rightarrow \mathbb{Z} \) be the choice function:

\[
c(S)(k) = \begin{cases} 
0, & k \notin S, \\
1, & k \in S.
\end{cases}
\]

Define \( F \) by

\[
F(a_1, a_2, \ldots, a_n) = F(2s_1(p-1) + \varepsilon_1, \ldots, 2s_n(p-1) + \varepsilon_n)
\]

\[
= \begin{cases} 
(S(\varepsilon_1, \ldots, \varepsilon_n), & \text{if } \#S(\varepsilon_1, \ldots, \varepsilon_n) \text{ is even}; \\
(S(\varepsilon_1, \ldots, \varepsilon_n), & \text{if } \#S(\varepsilon_1, \ldots, \varepsilon_n) \text{ is odd}; \\
((q - \varepsilon_1(a_1, \ldots, a_n))/2, s_1 - ps_2 - e_2, \ldots, s_{n-1} - ps_n - \varepsilon_n)) & \end{cases}
\]

where

\[
e_1(a_1, \ldots, a_n) = e_1(2s_1(p-1) + \varepsilon_1, \ldots, 2s_n(p-1) + \varepsilon_n)
\]

\[
= 2s_1p + 2e_1 - \sum_{i=1}^{n} a_i = e(a_1, \ldots, a_n) + e_1
\]

and \( S(\varepsilon_1, \ldots, \varepsilon_n) \subseteq [0, n-1] \) is defined by \( c(S(\varepsilon_1, \ldots, \varepsilon_n))(i) = \varepsilon_i \).

Therefore, one basis for \( \hat{P}_{\alpha, p^n} \) (which we will call the Dickson basis) is given as follows. For any \( n \geq 0 \), \( H^n(\Sigma_{p^n}) \cong (\ker i^*)_{\alpha} \oplus (\im i^*)_{\alpha}, \) as vector spaces. If \( p = 2 \), for each \( R \in X(2, n, \alpha) \), define \( D_R \in (H^n(\Sigma_{2^n}))^{\text{dual}} \cong H_n(\Sigma_{2^n}) \) by \( D_R|_{\ker i^*}, \im i^* \rangle \equiv 0 \) and \{\( D_R|_{\im i^*}, R \in X(2, n, \alpha) \} \) is the dual basis to the basis of \( (\im i^*)_{\alpha} \) given by Corollary 11. If \( p \) is odd, for each \( (\Lambda, R) \in X_1(p(n, \alpha) \cup X_2(p(n, \alpha)) \) define \( D_{(\Lambda, R)} \in (H^n(\Sigma_{p^n}))^{\text{dual}} \) by \( D_{(\Lambda, R)}|_{\ker i^*}, \im i^* \rangle \equiv 0 \) and \{\( D_{(\Lambda, R)}|_{\im i^*}, (\Lambda, R) \in X_1(p(n, \alpha) \cup X_2(p(n, \alpha)) \} \) is the basis dual to the basis of \( (\im i^*)_{\alpha} \) given in Corollary 11. Then we have seen that \{\( D_R|_{\im i^*}, R \in X(2, n, \alpha) \} \) is a basis for \( \hat{P}_{\alpha, 2^n} \) and \{\( D_{(\Lambda, R)}|_{\im i^*}, (\Lambda, R) \in X_1(p(n, \alpha) \cup X_2(p(n, \alpha)) \} \) is a basis for \( \hat{P}_{\alpha, p^n} \) if \( p \) is odd.

To get a second basis for \( \hat{P}_{\alpha, p^n} \), we use a theorem of Nakaoka’s:

**Theorem 13** (Nakaoka [19]). For each \( I \in A(p, q, n, \alpha) \) there exists an element \( b(I) \) in \( H_1(\Sigma_{p^n}) \); moreover \{\( b(I) | I \in A(p, q, n, \alpha) \} \) is a linearly independent
subset of \( H_1(\Sigma_{p^n}) \).

**Proof.** If \( n = 0 \), the only nonempty \( A(p, q, 0, 0) \) is \( A(p, q, 0, 0) = \{( ) \} \) for any \( q \). In this case define \( b(( ( ) )) \in H_0(\Sigma_1) \) as a generator for this one.
dimensional vector space. If \( n > 0 \), let \( Q(p, q, n, \alpha) = \{(j_1, j_2, \ldots, j_n) \in (\mathbb{Z}^+)^n \mid \text{for each } i, j_i \equiv 0 \text{ or } -1 \mod 2(p-1); j_{i-1} \leq p j_i \text{ for } i = 2, \ldots, n; j_1 > (p-1)(j_2 + \cdots + j_n); j_1 + j_2 + \cdots + j_n = \alpha; j_n < q(p-1)-1 \} \). If \((j_1, \ldots, j_n) \in Q(p, q, n, \alpha)\), define \( a(j_1, \ldots, j_n) \in H_\alpha(\Sigma_p^n) \) as Nakaoka does in [19, p. 248].

Nakaoka defines a one-one correspondence

\[ \chi : Q(p, q, n, \alpha) \to A(p, q, n, \alpha) \]

by \( \chi(j_1, \ldots, j_n) = (i_1, \ldots, i_n) \) where \( i_k = q p^n - k(p-1) - j_k \). Define \( b(I) = a(\chi^{-1}(I)) \); Nakaoka shows that \( \{a(J) \mid j \in Q(p, q, n, \alpha)\} \) are linearly independent. □

Kahn and Priddy [7, Proposition 3.4] show that \( \{b(I) \mid I \in A(p, q, n, \alpha)\} \) is a subset of \( \text{im} i_* \). Therefore, we have:

**Corollary 14.** (Compare with Kahn-Priddy [7, Proposition 3.7].) A vector space basis for \( \text{im} i_* \) is \( \{b(I) \mid I \in A(p, q, n, \alpha)\} \). □

The basis of Corollary 14 will be called the Nakaoka basis for \( \tilde{P}_{\alpha, p^n} \).

2. An algebra-coalgebra of “unstable” additive cohomology operations

There is a “wreath” product on \( \tilde{H}_* \) (see, e.g., [19 or 7]) which we review here. This product is a function \( H_\imath(\Sigma_m) \times \tilde{H}_j(\Sigma_n) \to \tilde{H}_{i+j+m}(\Sigma_{mn}) \).

If \( X_* \) is a chain complex over \( \mathbb{Z}/p \), let \( X_*^{\otimes m} \) denote the chain complex given by the usual \( m \)-fold tensor product of \( X_* \). The complex \( X_*^{\otimes m} \) becomes a \( \Sigma_m \)-complex by setting

\[ \sigma(x_1 \otimes \cdots \otimes x_m) = \varepsilon(\sigma, \text{deg} x_1, \ldots, \text{deg} x_m)(x_{\sigma^{-1}(1)} \otimes \cdots \otimes x_{\sigma^{-1}(m)}) \]

for \( \sigma \in \Sigma_m \); here \( \varepsilon : \Sigma_m \times (\mathbb{Z}^+)^m \to \{\pm 1\} \) is a function that makes \( X_*^{\otimes m} \) a \( \Sigma_m \)-complex, see [4] for a precise definition of \( \varepsilon \).

Define the wreath product \( \Sigma_m \wr \Sigma_n \) as the semidirect product of \( \Sigma_m \) and \( (\Sigma_n)^m \); where \( \Sigma_m \) acts on \( (\Sigma_n)^m \) on the left via permutation of factors. If \( M_* \) is a chain complex over \( \mathbb{Z}/p[\Sigma_n] \) and \( L_* \) is a chain complex over \( \mathbb{Z}/p[\Sigma_m] \), then \( L_* \otimes M_*^{\otimes m} \) becomes a \( \mathbb{Z}/p[\Sigma_m \wr \Sigma_n] \)-complex if we define

\[ (\sigma, \tau_1, \ldots, \tau_m)(1 \otimes x_1 \otimes \cdots \otimes x_m) = \sigma 1 \otimes \tau_1 x_1 \otimes \cdots \otimes \tau_m x_m. \]

**Proposition 15.** If \( L_* \) and \( M_* \) are as above, \( A \) is a \( \mathbb{Z}/p[\Sigma_m] \)-module, and \( B \) is a \( \mathbb{Z}/p[\Sigma_n] \)-module, then there is an isomorphism of chain complexes

\[ \phi : (L_* \otimes M_*^{\otimes m}) \otimes_{\Sigma_m \wr \Sigma_n} (A \otimes B^{\otimes m}) \to (L_* \otimes_{\Sigma_m} A) \otimes_{\Sigma_m} (M_* \otimes_{\Sigma_n} B)^{\otimes m}. \]

**Proof.** Left to the reader. □

**Theorem 16** (see, e.g., [4]). If \( L_* \) is a free acyclic \( \Sigma_m \)-complex and \( M_* \) is a free acyclic \( \Sigma_n \)-complex, then \( L_* \otimes M_*^{\otimes m} \) is a free acyclic \( \Sigma_n \wr \Sigma_n \)-complex. □
Proposition 15 and Theorem 16 say that we may compute

\[ H_*(\Sigma_n \cap \Sigma_n, A \otimes B^\otimes m) \]

by computing the homology of the chain complex

\[ (L_* \otimes \Sigma_m A) \otimes_{\Sigma_m} (M_* \otimes \Sigma_n B)^\otimes m ; \]

where \( L_* \) and \( M_* \) are as in Theorem 16. We assume \( L_* \) and \( M_* \) are as in Theorem 16 from now on.

If \( c \in H_i(\Sigma_m) \) and \( d \in H_j(\Sigma_n) \) define \( c \circ d \in H_{i+j+m}(\Sigma_m \cap \Sigma_n) \) by \( c \circ d = \) the homology class of

\[ c' \otimes (d' \otimes \cdots \otimes d') ; \]

where \( c' \in L_i \otimes \Sigma_m Z/p \) is a cycle representing \( c \) and \( d' \in M_j \otimes \Sigma_n Z/p \) is a cycle representing \( d \). The reader can check that this definition makes sense.

Now, once and for all, fix embeddings \( \rho_{m,n} : \Sigma_m \cap \Sigma_n \to \Sigma_{mn} \) for every \( m, n \geq 1 \). Then if \( c, d \) are as above, define \( c \circ d \in H_{i+j+m}(\Sigma_{mn}) \) as \( (\rho_{m,n})_*(c \circ d) \).

**Theorem 17** (Nakaoka [19]). If \( c \in H_i(\Sigma_m) \) and \( d \in H_j(\Sigma_n) \), and \( i \) and \( j \) are even if \( p \) is odd, then \( (c \circ d)^\wedge = \hat{c} \circ \hat{d} \).

**Proof.** (The assumption that \( i \) and \( j \) are even if \( p \) is odd is used because the definition of \( \hat{c} \) for \( c \in H_*(\Sigma_m) \) gives \( \hat{c} \) only as an operation on even degree cohomology.) We have

\[ (c \circ d)^\wedge = \left[ (\rho_{m,n})^*(c \circ d) \right]^\wedge = (c \circ d)^\wedge (\rho_{m,n}) \] (by [21])

\[ = \hat{c} \circ \hat{d} \] (by Nakaoka [19, Proposition 6.3]).

(We are using the notation of [3].) □

From now on, assume \( i \) and \( j \) are even if \( p \) is odd.

**Theorem 18.** (a) If \( \langle 1 \rangle \) is the generator of \( \tilde{P}_{0,1} \) then \( \langle 1 \rangle \circ x = x \circ \langle 1 \rangle = x \) for every \( x \in \tilde{P}_{i,p^n} \).

(b) If \( x \in \tilde{P}_{i,p^n} \), \( y \in \tilde{P}_{j,p^m} \) and \( z \in \tilde{P}_{k,p^l} \) then

(i) \( x \circ (y \circ z) = (x \circ y) \circ z \),
(ii) \( x \circ (y + z) = x \circ y + x \circ z \), if \( j = k \) and \( m = l \),
(iii) \( (x + y) \circ z = x \circ z + y \circ z \) if \( i = j \) and \( m = n \).

(c) If \( x \in \tilde{P}_{i,p^n} \) and \( y \in \tilde{P}_{j,p^m} \) then \( x \circ y \in \tilde{P}_{i+p^n,j,p^m} \).

**Proof.** We use the following basic fact: if \( x \) and \( y \in H_n(\Sigma_p) \) then \( x = y \) if and only if \( \hat{x}_q = \hat{y}_q \) for some (and hence for all) even \( q < \alpha + 1 \) (see Theorem 4(b)). So, in what follows, \( q \) is a sufficiently large even integer.

It is easy to directly compute that \( (\langle 1 \rangle_q)^\wedge = \) identity, so using Theorem 17, (a) follows.
By Theorem 17, \([x \circ (y + z)]_q = \hat{x}_q \circ (\hat{y} + \hat{z})_q\). But \(\hat{x}_q\) is an additive operation, so
\[
\hat{x}_q \circ (\hat{y} + \hat{z})_q = \hat{x}_q \circ \hat{y}_q + \hat{x}_q \circ \hat{z}_q = [(x \circ y + x \circ z)]_q.
\]
The other equalities in (b) actually hold for arbitrary (bihomogeneous) elements of \(\tilde{H}_*\), and follow from similar calculations.

By Corollary 5, \(\Phi_{\alpha,m}(H_*(\Sigma_m)) \subseteq mH^{m\alpha - \alpha}(\mathbb{Z}, q)\). So
\[
\Phi_{i+p^s j, p^n m}(x \circ y) \in p^{n+m}H^{p^{n+m}q - (i+p^n)}(\mathbb{Z}, q).
\]
Since \(x\) and \(y\) correspond to additive operations, so does \(x \circ y\). Therefore
\[
\Phi_{i+p^s j, p^n m}(x \circ y) \in p^{n+m}H^{p^{n+m}q - (i+p^n)}(\mathbb{Z}, q) \cap A^{p^{n+m}q - (i+p^n)}(\mathbb{Z}, q, \mathbb{Z}/p).
\]
By Theorem 8, \(x \circ y \in \tilde{P}_{i+p^s j, p^n m}\). This proves (c).

We conclude that \(\tilde{P}_{*, p^s} = \{\tilde{P}_{i, p^n}\}_{i \geq 0, n \geq 0}\) (where \(i\) is even if \(p\) is odd) becomes a bigraded \(\mathbb{Z}/p\)-algebra with multiplication
\[
\circ: \tilde{P}_{i, p^n} \otimes \tilde{P}_{j, p^m} \rightarrow \tilde{P}_{i+p^s j, p^{n+m}}.
\]
(Thus this “bigraded algebra” does not satisfy the usual bigrading conventions.)

From now on we assume that \(p = 2\). There is also a “coalgebra” structure on \(\tilde{P}_{*, 2^n} = \{\tilde{P}_{i, 2^n}\}_{i \geq 0, n \geq 0}\). To discuss this coalgebra structure, we will use the following theorems of Nakaoka and Hung. Let \(\Delta_{*, n}: H_*(\Sigma_{2^n}) \rightarrow H_*(\Sigma_{2^n}) \otimes H_*(\Sigma_{2^n})\) be the homomorphism induced by the diagonal \(\Delta: \Sigma_{2^n} \rightarrow \Sigma_{2^n} \times \Sigma_{2^n}\).

**Theorem 19** (Nakaoka [20]). Let \(a \in H_1(\Sigma_{2^n})\) and suppose that \(\Delta_{i, n}(a) = \sum a' \otimes a''\). Then, for any space \(X\) and any \(u, v \in H^q(X)\), we have \(\hat{a}(u \cup v) = \sum (a')^\wedge (u) \cup (a'')^\wedge (v)\).

**Theorem 20** (Hung [5]). Let \(\{D_R | R \in (\mathbb{Z}^+)^n, n \geq 0\}\) be the Dickson basis of \(\tilde{P}_{*, 2^n}\). Then \(\Delta_{i, n}(D_R) = \sum_{S+T=R} D_S \otimes D_T\) where \(R = (r_0, \ldots, r_{n-1}) \in (\mathbb{Z}^+)^n\) is such that \(\sum_{j=0}^{n-1} r_j(2^n - 2^j) = i\).

**Corollary 21.** For \(i \geq 0\) and \(n \geq 0\), \(\Delta_{i, n}(\tilde{P}_{i, 2^n}) \subseteq \bigoplus_{k+1=i} \tilde{P}_{k, 2^n} \otimes \tilde{P}_{1, 2^n}\).

Define an operation
\[
\circ \circ: \left( \bigoplus_{k+1=i} \tilde{P}_{k, 2^n} \otimes \tilde{P}_{1, 2^n} \right) \otimes \left( \bigoplus_{r+s=j} \tilde{P}_{r, 2^n} \otimes \tilde{P}_{s, 2^n} \right) \rightarrow \bigoplus_{i+u=i+2^n j} \tilde{P}_{i, 2^n+m} \otimes \tilde{P}_{u, 2^n+m}
\]
by \((z_1 \otimes w_1) \circ \circ (z_2 \otimes w_2) = (z_1 \circ z_2) \otimes (w_1 \circ w_2)\) if \(z_1, z_2, w_1\) and \(w_2\) are bihomogeneous elements of \(\tilde{P}_{*, 2^n}\). Let \(\bigoplus_{k+1=i} \tilde{P}_{k, 2^n} \otimes \tilde{P}_{1, 2^n}\) act on \(H^*(X) \otimes H^*(X)\) (let \(X\) be any nice enough space from now on) by the rule
\[
(\alpha \otimes \beta)^\wedge (x \otimes y) = \hat{\alpha}(x) \otimes \hat{\beta}(y).
\]
Lemma 22. \[ [\Delta_{*,*}(\theta_1)]^\wedge \circ [\Delta_{*,*}(\theta_2)]^\wedge = [\Delta_{*,*}(\theta_1) \circ \Delta_{*,*}(\theta_2)]^\wedge \] as operations on \( H^*(X) \otimes H^*(X) \cong H^*(X \times X) \). \( \square \)

Theorem 23. The homomorphisms \( \Delta_{i,m} : \tilde{P}_{i,m} \rightarrow \oplus_{k+1=i} \tilde{P}_{k,2m} \otimes \tilde{P}_{1,2m} \) are such that \( \Delta_{*,*}(x \circ y) = \Delta_{*,*}(x) \circ \Delta_{*,*}(y) \) for each bihomogeneous pair \( x, y \in \tilde{P}_{*,*} \).

Proof. We mimic Milnor's proof of the existence of the coalgebra structure on the mod-2 Steenrod algebra [15].

Let \( c : H^*(X) \otimes H^*(X) \rightarrow H^*(X) \) denote cup product. Then for each \( \theta \in \tilde{P}_{i,m} \) there is a unique element \( \Delta_{i,m}(\theta) \in \oplus_{k+1=i} \tilde{P}_{k,2m} \otimes \tilde{P}_{1,2m} \) such that \( \hat{\theta}(c(x \otimes y)) = c([\Delta_{i,m}(\theta)]^\wedge(x \otimes y)) \) for every space \( X \) and every \( x, y \in H^*(X) \).

Existence is proved by letting \( \Delta_{i,m}(\theta) \) be \( \Delta_{i,m}(\theta) \), and applying Theorem 19.

For uniqueness, by Theorem 4, \( \Phi_{1,2m} : \Sigma_{2m} \rightarrow H^{2mq-i}(SP^\infty S^q) \) is injective for \( q > i + 1 \) and \( m \geq 0 \). Thus,

\[
\tilde{\Phi}_{1,2m} : \bigoplus_{k+1=i} \tilde{P}_{k,2m} \otimes \tilde{P}_{1,2m} \rightarrow H^{2m(2q)-i}(SP^\infty S^q \times SP^\infty S^q)
\]
given by \( \alpha \otimes \beta \mapsto \Phi_{k,2m}(\alpha) \otimes \Phi_{1,2m}(\beta) \) is injective if \( q > i + 1 \) and \( m \geq 0 \).

Suppose \( \rho_1, \rho_2 \in \bigoplus_{k+1=i} \tilde{P}_{k,2m} \otimes \tilde{P}_{1,2m} \) and \( \theta \in \tilde{P}_{i,2m} \) are such that

\[
\hat{\theta}(c(x \otimes y)) = c(\tilde{\rho}_j(x \otimes y))
\]
for \( j = 1, 2 \) and any \( x, y \) in any \( H^*(X) \). Letting \( X = SP^\infty S^q \times SP^\infty S^q \), \( x = i_\infty \times 1 \) and \( y = 1 \times i_\infty \), we have \( \rho_j(x \otimes y) = \Phi_{1,2m}(\rho_j) \) for \( j = 1, 2 \) (by naturality of the operations induced by elements of \( \tilde{P}_{*,*} \), and standard properties of the \( \times \) and \( \cup \) products). So, \( \rho_1 = \rho_2 \).

Now, since

\[
[\theta_1 \circ \theta_2]^\wedge(c(x \otimes y)) = \hat{\theta}_1(\hat{\theta}_2(c(x \otimes y)))
\]
\[
= c([\Delta_{*,*}(\theta_1)]^\wedge \circ [\Delta_{*,*}(\theta_2)]^\wedge)(x \otimes y)
\]
we have \( \Delta_{*,*}(\theta_1 \circ \theta_2) = \Delta_{*,*}(\theta_1) \circ \Delta_{*,*}(\theta_2) \). \( \square \)

4. A COMPUTATION IN THE ALGEBRA \( \tilde{P}_{*,p} \).

Let

\[
D_n = \begin{cases} 
D_{1,0,\ldots,0} \in H_{2^{n-1}}(\Sigma_{2n}) & \text{if } p = 2, \\
D_{1,0,\ldots,0} \in H_{2(p^n-1)}(\Sigma_{p^n}) & \text{if } p > 2;
\end{cases}
\]

\( D_n \) is an element of the Dickson basis for \( \tilde{P}_{*,p} \) for each \( n \geq 1 \). Define \( D_0 \) as \( \langle 1 \rangle \in H_0(\Sigma_1) \). If \( (r_1, \ldots, r_n) \in (\mathbb{Z}^*)^n \), let \( (\xi_1, \xi_2, \ldots, \xi_n)_{\text{dual}} \) denote the element of the Steenrod algebra \( \mathcal{A}_{p^*} \) dual to the monomial \( \xi_1^{r_1} \cdots \xi_n^{r_n} \) in the Milnor basis of \( \mathcal{A}_{p^*} \), with respect to that basis.
The following theorem is a special case of theorems of Mui [17, 18]:

**Theorem 24 (Mui).** (a) If \( p = 2 \),

\[
(\hat{D}_n)_q = \begin{cases} 
0 & \text{if } q < 1, \\
\left(\xi_n^{q-1}\right)_{\text{dual}} & \text{if } q \geq 1. 
\end{cases}
\]

(b) If \( p > 2 \), and \( q \) is even,

\[
(\hat{D}_n)_q = \begin{cases} 
0 & \text{if } q < 2, \\
\left(\xi_n^{(q-2)/2}\right)_{\text{dual}} & \text{if } q \geq 2. 
\end{cases}
\]

Therefore,

\[
(D_n \circ D_m)_q^\wedge = \begin{cases} 
(\hat{D}_n)^{2m(q-1)+1} \circ (\hat{D}_m)_q = \left(\xi_n^{2m(q-1)}\right)_{\text{dual}} \circ \left(\xi_m^{q-1}\right)_{\text{dual}} , & \text{if } p = 2, \ q \geq 1; \\
(\hat{D}_n)^{pq(q-2)/2} \circ (\hat{D}_m)_q = \left(\xi_n^{(pq(q-2)/2)}\right)_{\text{dual}} \circ \left(\xi_m^{(q-2)/2}\right)_{\text{dual}} , & \text{if } p > 2, \ q \text{ is even}, \ q \geq 2.
\end{cases}
\]

In particular, if \( p = 2 \), \((D_n \circ D_m)_1^\wedge = \text{identity}\); and if \( p \) is odd, \((D_n \circ D_m)_2^\wedge = \text{identity}\). So, \( D_n \circ D_m \neq 0 \). But we see that

\[
D_n \circ D_m \in \begin{cases} 
\tilde{P}_{2n+m-1, 2n+m} & \text{if } p = 2, \\
\tilde{P}_{2(p^n-1), p^n+m} & \text{if } p > 2;
\end{cases}
\]

and by inspecting the Dickson basis for \( \tilde{P}_{*,p^*} \), that \( \{D_{n+m}\} \) is a basis for

\[
\begin{cases} 
\tilde{P}_{2n+m-1, 2n+m} & \text{if } p = 2, \\
\tilde{P}_{2(p^n-1), p^n+m} & \text{if } p > 2.
\end{cases}
\]

In any case, \( D_n \circ D_m \) is a nonzero scalar multiple of \( D_{n+m} \). Again, comparing the cohomology operations in degree 1 (or 2, if \( p > 2 \)) implies that \( D_n \circ D_m = D_{n+m} \).

On the other hand, Milnor's formula [15] for computing \( (\xi_k^\text{dual}) \circ (\xi_l^\text{dual}) \) says that \( (\alpha = q - 1, \text{ if } p = 2; \ \alpha = (q - 2)/2, \text{ if } p > 2) \)

\[
(\xi_n^{m+n})_{\text{dual}} \circ (\xi_m^\text{dual}) = \begin{cases} 
\sum_{0 \leq x \leq n} \left(\xi_n^{(x-\alpha)(p^n+1)}\right)_{\text{dual}} \cdot b(x, q, p, n) , & \text{if } m = n, \text{ and } q \text{ is even if } p > 2, \\
\sum_{0 \leq x \leq n} \left(\xi_m^{(x-\alpha)p}\right)_{\text{dual}} \cdot b(x, q, p, n), & \text{if } m \neq n, \text{ and } q \text{ is even if } p > 2.
\end{cases}
\]

Here, \( b(x, q, p, n) \) is a binomial coefficient depending on the indicated parameters.
So, for example, if \( p = 2 \), \( n \neq m \), and \( q \geq 1 \), we have a relation
\[
\sum_{0 \leq x < q-1} (\xi_n^{q-1-x})^{2^m} \xi_m^{q-1-x} \xi_n^x \xi_{n+m} \text{dual} \equiv 0
\]
in degree \( q \).

5. Conclusion

In summary, this paper points out how the work of others on mod-\( p \) cohomology operations and the mod-\( p \) cohomology of the symmetric groups can be used to compute a basis for an analogue of the Newton primitives (i.e., the Adams operations) in complex \( K \)-theory.

Although the additive cohomology operations induced by these primitives are, strictly speaking, unstable, they are essentially stable because Cartan [2] has told us that every additive operation in degree \( q \) in mod-\( p \) cohomology is given by an appropriate element (depending on \( q \)) of the Steenrod algebra.

One could ask whether or not the same is true of other cohomology theories. In other words, suppose that \((h^\ast, \eta)\) is a cohomology-homology theory with a transfer, a Kunneth formula, an analogue of Steenrod's power map and whatever else is necessary so that it makes sense to discuss primitives in \( \bigoplus_{n \geq 0} h^\ast(B\Sigma_n) \) and the cohomology operations they induce. Do you get any essentially unstable additive operations on \( h^\ast \) in this way?
